Butter, in its natural state, contains a considerable proportion of mucilaginous matter which is more pungent than the pure oily parts. When it is pipped, therefore, to expel the butter to the heat of warm climates, it ought to be freed from that mucilage, before it be covered and packed for keeping. In order to prepare butter for a distant voyage in warm climates, it should be put into a vessel of a proper shape, which should be immersed into another containing water. Let the water be gradually heated, till the butter be thoroughly melted; in that state let it continue for some time, and be allowed to settle; the mucilaginous part will fall entirely to the bottom, and the pure oil will swim at top, perfectly transparent, while hot; but when it cools, it becomes opaque, assumes a colour somewhat paler than the original butter, before it was melted, and a firmer consistency, more nearly resembling that of tallow; and consequently it will better suit the heat of a warm climate than common butter. When this refined butter is become a little stiff, and while it is still somewhat soft, the pure part should be separated from the dregs, then melted, and packed up in the same way with other butter: this will retain the salt butter, and keep much longer sweet, in hot climates, than if it had been cured in its original state. This refined butter may be preserved by adding to it, after it has been purified, a certain proportion of fine honey; mixing them well, so that they may thoroughly incorporate. This mixture has a pleasant taste, and spread on bread, is useful for coughs and colds. It will keep for years, without manifesting the smallest tendency to rancidity; and of course, butter might be thus preserved in long voyages, without spoiling. Dr. Anderson suggests, that one ounce of honey might be sufficient to preserve 16 ounces of butter.

By 36 Geo. III. c. 86. the 13 & 14 C. II. c. 26. and so much of 4 W. c. 7. as discharges persons from the effect of any part of 13 & 14 C. II. for preventing frauds in the sellers of butter, after the factor or buyer hath contracted for the same, are repealed; and new regulations are made respecting the packing, weight, and sale of butter, which are as follows:—every cooper or other person, who shall make any vessel for the packing of butter, shall make the fame of good and well-seasoned timber, light and not leaky, and shall groove in the heads and bottoms thereof: and every such vessel shall be a tub, firkin, or half-firkin, and no other, capable of containing the several quantities of butter herein before mentioned; viz. every tub shall weigh of itself, including the top and bottom, not less than 11 lb. nor more than 1½ lb. avoidpois weight, and neither such top nor bottom shall be more than ⅕ ths of an inch thick in any part thereof, and shall be capable of containing 54 lb. of butter, and not less; every firkin shall weigh of itself, including the top and bottom, not less than 7½ lb. nor more than 11½ lb. and neither the top nor bottom shall be more than ⅔ ths of an inch thick in any part, and shall be capable of containing not less than 56 lb. of butter: and every half-firkin shall weigh of itself, including the top and bottom, not less than 4 lb. nor more than 6 lb., and neither the top nor bottom shall be more than ⅔ ths of an inch thick in any part, and shall be capable of containing not less than 28 lb. of butter, on pain of forfeiting by the cooper or other person making the same, 10s. for every such vessel. The maker shall brand on the outside of the bottom with an iron, his name at full length in permanent and legible letters, together with the exact weight or tare thereof, on the like
like penalty. And by 38 Geo. III. c. 73. every maker
shall mark in like manner his place of abode, or dwelling;
and if his name, on the same penalty. By 36 Geo. III. c. 80;
every dairy-man, or filler of butter, or person keeping butter
at sale, shall pack it in such vessel, properly sealed and
sealed, branding his name after such sealing, on the
bottom within, and on the top without; and also on the
outer side of the top, and on the bonge or body thereof, the true
weight or tare of such empty vessel so sealed, and his name
on the body, across two different places; and he shall dis-
tinctly and at full length, impress his name upon the top
of the butter in such vessel when filled; on pain of forfeiting
5l. for every such offence; the quantities to be packed, shall
be, exclusively of the tare of the vessel, in every tub not less
than 8lb.; firkin 56lb. and half firkin 28lb. of good and
merchantable butter; and no butter which is old or corrupt,
shall be mixed or packed up into any such vessel, with that
which is now churned; nor shall any whey butter be packed
or mixed with that which is made of cream; and no butter
shall be salted with great salt, but with fine small salt, and
not intermixed with more than is needful for its preservation,
and on pain of forfeiting 5l. Any fraud with regard to the
vessel or butter, marks or flaves, &c. shall render the person
concerned in it liable to a forfeiture of 50l. for every such
offence. Fakers buying or selling butter in vessels not
legally marked according to the acts, shall forfeit 20s. for
every such offence; and cheesemakers and other dealers in
butter, having in their possession any vessel containing butter
at sale, not externally marked, shall forfeit 20s. for every
such offence; and they are required to deliver the full quan-
tity, or be liable to an action for recovery of satisfaction with
colls: nor shall they repack butter for sale, on pain of for-
feiting 5l. for every tub, firkin, or half firkin so repacked.
Foreign butter, however, may be repacked in such vessels,
the name of the original seller being erased, and the name of the
person selling being marked with an iron brand, in words at
length, together with the words, "foreign butter," upon
the body of every such vessel: counterfeiting, or forging
marks subjects to a penalty of 50l. All penalties above
5l. are to be recovered in the courts at Welleminster; and
those not exceeding 5l. may be determined by one justice,
and levied by diffire and sale of the offender's goods, for the
use of the informer; or for want of sufficient diffires, the
offender may be committed to the gaol or house of correction,
without bail, for a time not exceeding 3 calendar months,
nor less than 28 days. Every information or prosecution
must be commenced, within four months after the offence
committed.

The statute 4 W. c. 7, regulates the shipping of butter and
cheese for London; the person shipping shall receive
for his pains 2 s. 6 d. for every load; and if he shall make
default, he shall forfeit on conviction before one justice,
for every firkin of butter 10s. and for every weight of cheese 5s.
half to the poor, and half to the informer, to be levied by the
court or by diffires and sale. He shall keep a book of
entry, for receiving and shipping the goods, under the
penalty of 2s. 6d. for every firkin of butter. &c. The
matter of a ship refusing to take in butter or cheese, before
he is full laden, shall forfeit for every firkin of butter 5s.
and for every weight of cheese 2s. 6d. This act does
not extend to any warehouse in Cheshire or Lancashire.
In the act of S Geo. c. 27, there are special directions concerning
the sale of butter in the city of York; and in 17 Geo. II.
c. 8, concerning the name in New Malton.

BUTTER. In its reference to disease and medicine, may be regarded
as resembling its finished qualities, and in con-
sequence of a chemical analysis, the expressed and unctuous
oils of vegetables, and animal fats. Butter, by distilla-
tion in the water bath, gives out a portion of watery fluid,
that either remained interposed between its parts from the
first, or was taken up during the warming which it undergoes
in the process of making. A stronger heat, carefully man-
aged, expels first a strong acid of a pungent smell, which
is followed by a concrete coloured oil, polishing the same
our. Very little coal remains: the acid appears to be of
the nature as that distinguished by the name of the
acid of fat; and it may be also obtained from butter by
means of lime or an alkali. See Fat and Oil. Butter,
like the other mild and fat oils, is liable to a change called
"Rancidity;" and it becomes rancid sooner than most
other fat oils, probably on account of the water, which may
favour the development of its acid. Washing with water, or
ardent spirit, reduces it in some measure to its former
state, by carrying off the disengaged parts of the acid. Butter,
not well freed from the milk, more readily becomes rancid,
than that which is more entirely separated from it; and
butter by being melted, and freed from a deposit which it
makes, on being kept for some time in a mulled state, may
thus be longer preferred from rancidity. By the application
of salt, the rancidity of butter is obviated; and the more
perfect the salt is, the greater is its efficacy, and a less
quantity will suffice; and if at the same time we affil its
antiseptic power, by the addition of a small quantity of nitre,
fugar, and honey, we may then preferve butter very long in a
condition fit to be used as an aliment. The rancidity of but-
ter, according to the experiences of Parmentier and Deyex,
(Memoire qui a remporté le premier prix, &c. 1790.) is
found to proceed entirely from the coagulable, or cheesy
mater which is mixed with it. The quantity of this mix-
ture is inceased by the economical method of warming the
milk, in order to increase the quantity of cream, and by let-
ting the cream remain for too long a time before it is
churned. Thus the cream that rikes without the aid of
warmth, and that is formed into butter, while perfectly fresh,
will yield the most delicate kind, and may be preferred for
the longest time. Whether the oily part of milk is most
fisely employed in the flate of cream, when it is joined with
some portion of the curdous and serum, or when it is
more entirely separated from these in the flate of butter, is a
question that has not been absolutely determined. Dr.
Cullen (Mat. Med. Vol. i. p. 319.) expresses his opinion,
that a quantity of oil in the flate of cream will be more
easily digestsed than an equal quantity of the oily part in the
flate of butter. Some difference, however, in this mattrer
may arise from the difference of flomachs, more or less dis-
pofed to digests oil; and persons have been known, who
could digest cream better than butter. Another difference
may also arise from the flomach being more or less disposed
to acidity; and in the more acceflible flomach, cream may
be more offensive than butter. Butter, as a wholesome al-
iment, should be fresh and free from rancidity, and not fried
or burnt; otherwise it will disorder digestion, and be injuri-
ous. As to its medical effect, butter, as well as the other
olea blandia, or mild oils, is considered as a laxative. To
this purpose Dr. Cullen observes, that a person, being ad-
viced to take as a medicine, every morning, four ounces
of fresh butter, found its constant effect to be that of producing
a flow or two more than usual. By some it has been sup-
posed, that it has a tendency to drop in the capillaries and
glands, and to foul the viesen; whence proceed blotches and
cutaneous diæties.

BUTTER. Clarified, is newly churned butter, without salt,
molten over a clear fire, and having the curly part skimmed
off. Two spoonfuls of the clarified remainder have been re-

has been kept from milk, from the meat of milk, from the meat of milk, has been employed in phthisical cafes with greater advantage than ether the entire milk, or the watery parts of it in a more acid state. It is, however, in this last flate, that it is most commonly employed; and it is highly useful in all cafes where the refrigerant powers of milk are required. As the longer it has been kept it seems to have its acidity increased, so it proves more powerfully refrigerant. Some have imagined, that in certain cafes it might be dangerous, but unless when drank in very large quantity, or when the body is very warm, Dr. Cullen says, that he has not perceived its bad effects; and in the last cafe, it is probable that cold water would have been equally injurious. With respect to the acid of butter milk, or other acid flates of the watery part of milk, it is worth observing, that such acid does not increase the accefinity of the fomach, or occasion the flatulency that recent vegetable acids and acetum com- monly do; and therefore it is more safely than these employed by dyplcptic persons. Cullen, Mat. Med. vol. i. p. 353.

BUTTER-lump, or butlin, in Ornithology. See Ardea stellaris.

BUTTER-bur, in Botany. See Tussilago farfetis and hybridu.

BUTTER-cap. See Ranunculus acriu.

BUTTER-jags. See Medicago falcata.

BUTTER-mut, a fruit in New England, whose kernel yields a great quantity of sweet oil.

BUTTER-wort. See Pinguicula.

BUTTER, Butyrum, is also ufed to express several chemical substances—as butter of antimony, of arsenic, of ben, of bismuth, of cacao, of flax, of saturn, of tin, of wax, &c. on account of their form of confluence resembling that of butter.

BUTTER, of flone, a kind of mineral drug found on the highest mountains, and hardest rocks of Siberia, being drawn by the sun's heat, in the way of transudation, from the dry subfolution of the flones themselves, and adhering to the surface thereof like a fort of cals, which having received its full ecction, is scraped off by the inhabitants under the name of kamine majof. The Ruffians afscribe many virtues to it. It is much used for the dyefterry and venereal diseases; but its operation is fo violent, however corrected by other ingredients, that none but the Ruffians dare use it.

BUTTER, vegetable. See Semeaes.

BUTTERANT, in Geography, a village of the county of Cork, in Ireland, remarkable for the ruins of several ecclelitical buildings. It was formerly a corporate town, governed by a mayor and aldermen, but it is now given to decay. The ruins, which are situated on a precipice above the river Owebg, have a very picturesque appearance. The poet Spencer lived in this neighbourhood. Dulance S.W. from Dublin 130½ miles, and 21 miles N. by W. from Cork.

BUTTERFELDE, a town of Germany, in the circle of Upper Saxony, and New Mark of Brandenburg; 5 miles N. of Darwalde.

BUTTERFIELD, a settlement of America, in Cumberland county, and district of Maine, containing 189 inhabitants, and lying about 43 miles N. from Falmouth, on Capeo bay; having Butterfield-flip on the north, and Buck- town on the south.

BUTTERFISH, in Ichthyology, a small species of the Bftius genus, called specifically by naturalists gunnclus, and the spotted blenny; it is distinguished by the name of butterfish by the inhabitants on several of the English coasts. Donov. Brit. Fishes. See Btius gunnellus.

BUTTERFLY, in Entomology. See Papilio.

BUTTERFLY, satyrius, in Botany. See Orchis.

BUTTERFLY fish, in Ichthyology, an English name of the ocellated blenny, Bftius ocellaris, a fish found in the Mediterranean sea; and which is distinguished by having a large black ocellar spot in the anterior part of the dorsal fin, whereas this fish is supposed to bear a fanciful resemblance to the wing of a butterfly.

BUTTERHILL, in Geography, a high round hill of America, on the west bank of Hudson river, at the northern entrance of the High-lands.

BUTTERIS, in Farriery. See Butterres.

BUTTERMERE, in Geography, a village of Cumberland, in England, is seated in a part of the country which has been frequently admired and described by topographers and tourists. The majestic mountains, and transparent lakes of this district, present those wild but delightful features of landscape, which cannot fail to awaken feelings of pleasure and delight. The village has nothing peculiar to excite notice, but the water or lake, which gives name to the place, is particularly beautiful. It occupies an area of about one mile and a half in length, by half a mile in breadth. Its western shore is hemmed in by a range of rugged mountains, rising abruptly from the margin of the water. These assume a dark and heavy aspect, and are known to the shepherds, who are almost the only persons that trace their craggy fleeces, by the names of Hay-cock, High-crag, High-flee, and Red-pike. The eastern shores rise more gently, are partially wooded, and admit of cultivation at a short distance from the lake; the north end is skirted by the verdant vale of Buttermere, and the southern extremity is bounded by Ho- niller-crag, which forms an abrupt termination to a chain of mountains. From this fiece, numerous torrents are continually pouring down their foaming waters into the lake: one of these cataracts falls between four and five hundred yards. The river which furnishes the principal supply of water to the lake, flows through Gatesgirth-dale, which is described by Mr. Gilpin as a most singular and tremendous scene. It winds slowly and solemnly in one large segment; being a narrow concave valley, the sides of which are almost perpendicular, and composed of a broken craggy rock. The river which runs through this valley, is as wild as the valley itself,
itself. It has no banks, but the fragments of rocks, no bed but a channel composed of rock fragments, among which the water forces its course. The middle of the valley is adorned, as these valleys in some parts are, by a craggy hill; on the top of which stands the fragment of a rock, that looks, in Oliff's language, like the flower of power, the rude dignity of defoliation, to which the scene is sacred. Gilpin's Tour to the Lakes, &c.

BUTTERY.—Officers in the king's buttery are a gentleman, yeoman, and three grooms of the buttery. The butter among sty is usually placed near the cellar; being common used for the top of the cellar stairs.

BUTTHERD, in Geography, a town of Germany, in the circle of Franconia, and bishopric of Wurzburg.

BUTTING, in Botany, in Middle Age Writers, is used for tuming of wine, or putting it into butts.

BUTTING-piller. See PILLEN.

BUTTLINGEN, in Geography, a town of Germany, in the circle of Lower Saxony, and duchy of Luneburg Zell.

Eff. Ch. Cal. five-leaved; petals five, arched, three-lobed at their summit, the middle lobe prolonged into a filiform kind of awn. Capsula five-grained, muricate.

Sp. B. Scabro Linn. spec. "Leaves lanceolate, rib and petioles prickly." (Lock it. 312. Aubl. Guian. 1 t. 241. t. 96.) Root perennial. Stem shrubby at bottom; branches alternate, long, angular, armed with short, reflexed, cari- ginous prickles. Leaves linear-lanceolate; alternate, toothed; midrib armed with recurved prickles; lower ones petioled, upper fiddle; filipes two, deciduous. Flowers axil- lary, fingle, on short peduncles. Found by Aublet in Guiana, between Cayenne and Couron. 2. B. carthaginensis, Linn. Mant. "Leaves ovate; rib and petioles prickly." (B. aculeata Jacq. Americ. 76. pl. 41.) Root perennial. Stem with branches spreading on every side in the manner of the common bramble, rather woody, five-cornered; the furrows and angles obtuse, armed with crooked reflexed prickles, tender branches, round, prickly, alternate. Leaves smooth, quite entire, or with only one or two ferrattures, alternate, deciduous, thofe on the old branches ovate, acute, four inches long or more, on the younger lanceolate-acuminate, left. Raceme short, aggregate, and axillary on the younger branches. Flowers without smell, small, white, very numerous. A native of Carthagena and St. Domingo. Obs. La Mark and Willdenow unite the two preceding; but in concurrence with professor Martyn, we have not ventured to oppose the authority of Jacquin, who affirms that his aculeata and Aublet's plant are not the same species.

B. ovata. La Mark. "Leaves ovate, serrated; petioles unarmed; branches five-angled, prickly; stem erect." (La Mark Illust. Pl. 142. Cavan. Diff. t. 142. f. 1.) Root perennial. Stem four or five feet high, without prickles; branches all ascending, rather slender, green, smooth, supple, prickly at the angles. Leaves about an inch long. Flowers axillary, in a small corymbus or umbel, from three to six together, on short peduncles. Calyx with five acute, expanded divisions. Petals trifid at their summit; the middle segment a very long purple or violet thread. Found in Peru by Joseph de Juliena, who sent seeds to the Royal garden at Paris. Described from the living plant by La Mark. B. cordata. La Mark (Böttnera aculeata Dombey Herb. Peruv.) "Leaves cordate, acuminate, ferrate, pubescent beneath; petals without prickles. Stem prickly." A Sarmentose shrub about eight feet high. Stem five-angled; prickles on the angles incurred. Leaves three inches broad. Flowers whitish, in small, peduncled, axillary umbels. Capsulae round, slightly hispid. Found by Dombey in the neighbourhood of Lima in Peru. B. tristilata. La Mark. "Leaves ovate-lanceolate, acuminate, very entire; branches prickly, round." La Mark Ill. Pl. 140. f. 2. Branches a little pubescent. Leaves petioled, two inches long, about half an inch broad. Capsulae small, round, more hispid than the preceding. Native of Peru, gathered by Joseph de Juliena. B. microphylla. Mant. "Branches zigzag, even; leaves ovate, obtuse, on short peduncles." La Mark. A herb. Stem four or five feet high, much branched at its summit; prickles foliary, stipular, horizontal; branches green, smooth, fupple, obtusely angular. Leaves sometimes emarginate, entire, smooth, about half an inch long. Flowers small, whitish green, peduncled, axillary, from three to five together. Calyx one-leaved, with five spreading divisions. Petals trifid; segments linear, the lateral ones the shortest. Capsulae thorny all over. La Mark. A native of America, cultivated in the Imperial garden at Vienna. 5. B. herbeeca. Willd. "Leaves heart-shaped, toothed, without glands; stem herbeaceous, without prickles." Willd. Rost. Corom. t. 29. A native of the East Indies, on the summits of mountains. 8. B. catalpaefolia. Willd. "Leaves heart-shaped, very entire; stem climbing, without prickles." Jacq. Hort. Sch. t. 46. A native of Caracas in South America.

Buttock, in Ship Building, that part of the after body of a ship, bounded by the counter and quarters, and having the stern poit in the middle. The buttock is the support of the after part of the ship; it ought not, however, to be too full, because then the ship would be difficult to steer; nor too lean, as, in a rough sea, the after part will fall down too much.

Buttocks of a horse, in the Mange, are situated below the crupper and the origin of the tail, and extend to the place where the hind-leg joins the body.

Button, in its most ordinary acceptation, signifies a well known appendage to garments for conveniently fastening them together.

Trifling as this article may appear to some of our readers to be in itself, there is certainly no manufacture which includes such an infinite variety of operations as that of the button-maker. The number of substances of which they are made is almost inconceivable, and each requires a distinct set of manipulations. Amongst them are gold, silver, plated copper, white metal, pinchbeck, steel, japanned tin, glafs, foil foices, mother of pearl, ivory, bone, horn, tortoise-shell, jet, cannon-coal, paper, leather, and a thousand others; exclusive of those buttons which consist of a mould of wood or bone covered with silk or moiré, and the manufacture of which belongs to a different class of artificers. It would very
very far exceed the limits of a work like the present if we were to enter into all the details of so multifarious a business as this: we shall therefore only trace a few outlines of the processes most ordinarily in use.

Of the manufacture of metal buttons. These are originally formed in two different ways; the blanks are either picked out of a large sheet of metal with a punch driven by fly-preps, or call in a pair of shears of moderate size, containing 10 or 12 dosen each. In this latter case, the blanks are previously fixed in the form, exactly in the centre of the impression formed by each pattern, to have their extremities immersed in the melted metal when poured into the flask, by which means they are consequently firmly fixed in the button when cooled. See Poucver. The former process is generally used for yellow buttons, and the latter for those of white metal.

We shall first give an instance of the former mode of procedure as used in the manufacture of gilt buttons. The gilding metal is an alloy of copper and zinc, containing a smaller proportion of the latter than ordinary brass, and is made either by fusing together the copper and zinc, or by fusing brasses with the requisite additional proportion of copper. This metal is first rolled into sheets of the intended thickness of the button, and the blanks are then pierced out as before mentioned. The blanks thus formed, are, when intended for plain buttons, usually planified by a single stroke of a plain die driven by the same engine, the fly-preps: when for ornamented buttons, the figure is frequently also struck in like manner by an appropriate die, though there are others which are ornamented by hand. The blanks, which are made with wonderful facility and expedition by means of a very curious engine, are then temporarily attached to the bottom of each button by a wire clamp like a pair of sugar-tongs, and a small quantity of folder and rein applied to each. They are in this state exposed to heat on an iron plate containing about a grofs, till the folder runs, and the flank becomes fixed to the button, after which, they are put singly in a lathe, and their edges turned off smoothly.

The surface of the metal, which has become in a small degree oxidized by the action of the heat in foldering, is next to be cleaned, which, in this, as in a great variety of other inlines in the manufacture of metallic articles, is effected by the process of dipping or picking; that is, some dozens of them are put into an earthen vellf pierced full of holes like a colander; the whole dipped into a vessel of diluted nitric acid; suffered to drain for a few seconds; again dipped successively into four or five other vessels of pure water, and then dried.

The next operation is the rough burnishing, which is performed by fixing the buttons in the lathe, and applying a burnisher of hard black flint from Derbyshire: the minute pores occasioned by the successive action of the heat and the acid are thus closed, and the subsequent process of gilding considerably improved, both with regard to economy and perfection.

The first step towards the gilding of all the alloys of copper consists in covering the surface uniformly with a thin stratum of mercury, by which means the amalgam, which is afterwards applied, attaches itself to it much more readily than it would otherwise do. This part of the process is called quicking, and is effected by flirling the buttons about with a brush in a vessel containing a quantity of nitric acid superfaturated with mercury; which latter is, of course, by the superior electivity of attraction of the copper for the acid, precipitated in its metallic state on the buttons, whose surfaces become uniformly and brilliantly covered with it. The mercury which hangs in loose droops on the buttons is then shaken off by jerking the whole violently in a kind of earthen endoth made for the purpose; and they are then ready for receiving the amalgam.

The amalgam is made by heating a quantity of grain gold with mercury in an iron ladle, by which means the former is soon dissolved, and the whole is then poured into a vessel of cold water. The superabundant mercury is strongly prefled out through a piece of chamois leather, and the remaining amalgam, which is of about the consistence of butter, is then fit for application.

This is performed by flirling the buttons, whose surfaces are already thinly covered, or wetted with mercury, in an earthen vessel with the requisite proportion of amalgam and a small quantity of diluted nitric acid, by which means the amalgam also attaches itself to their surfaces with a considerable degree of equality. The necessary quantity of gold is about five grains to a grofs of buttons of an inch in diameter.

The next process is the volatilisation of the mercury by heat, which is usually called by the workmen drying off. This is performed by first heating the buttons in an iron pan, somewhat like a large frying pan, till the amalgam with which they are covered becomes fluid, and feems diffused to run into drops, on which they are thrown into a large felt cap, called a gilding cap, made of coarse wool and goat's hair, and flirred about with a brush to equalize the covering of the surface by the gold. After this, they are again heated, again thrown into the gilding cap and flirred, and these operations successively repeated till the whole of the mercury is volatilised. This part of the process, as will readily be conceived, is extremely unwholesome, and has the most terrible effects on the constitution of the workmen, so that it would be no small defideratum (and it does not seem to be difficult), conveniently to effect this agitation and friction of the heated buttons in a covered vellf; in which cafe also, though of inferior importance, the volatilized mercury might be saved. For preventing the wale and injury attending this process, an apparatus resembling that delineated in Plate II. Miscellanies, fig. 1, has been partially and successfully adopted by Mr. Mark Sanders, an eminent button-maker of Birmingham.

"A hearth of the usual height is to be erected, in the middle of which a capacity for the fire is to be made; but instead of permitting the smoke to ascend into the top A, made of sheet or call iron, through which the mercury is volatilised, a flue for that purpose should be conducted backwards to the chimney B. An iron plate, thick enough to contain heat sufficient to volatilise the mercury, is to cover the fire-place at the top of the hearth C. There must be an ash-hole, D, under the fire-place. The square space E, seen in the fire-place, is the flue, which serves to carry the smoke back under the hearth into the chimney B. The door of the fire-place and ash-pit may either be in front, as represented in the plate, or at the end of the hearth at F."

It would be of great advantage if the space between A and the iron plate C was covered up with a glass window coming down to low as only to leave sufficient room for moving the pan backwards and forwards with facility. If the sides were also glass instead of brick-work it would be still better, as the work-people would be able to have a full view of their work without being exposed to the fumes of the mercury, which, when volatilised by heat communicated to the pan by the heated iron plate over the fire-place, would ascend into the top A, appropriated for its reception, and descend into the tub G, covered at top and filled pretty high with water. By this means the hearth would, in a fact, become a distilling
The water may be occasionally drawn out of the tubs by a siphon, and the mercury dizzled with heterogeneous matter may be triturated in a piece of flannel till it passes through, or placed in a pan of sheet iron, like a dropping-pan, in a sufficient degree of heat, giving it a tolerable inclination, so that the mercury, as it gets warm, may run down and unite in the lower part of the pan. But the mercury will more effectually be recovered by exposing the residuum left in the flannel bag to distillation in a retort made of iron or of earthen ware.

When the mercury is volatiled from the buttons, or, as the workmen denominate it, when the buttons are dried off, they are finally burnished, and are then finished and fit for carding.

The reader unacquainted with this branch of manufacture will be surprised to learn how far a small quantity of gold, incorporated with mercury, will spread over a smooth surface of copper. Five grains, worth one shilling and threepence, on the top of a groove, that is, 144 buttons, each of one inch diameter, are sufficient to excite the manufacturer from the penalty inflicted by an act of parliament; yet many, upon an assay are found to be deficient of this small quantity, and the latter fined and the buttons forfeited accordingly. Many hundred grooves have been tolerably gilt with half that quantity; so extremely far can gold be spread, when incorporated with mercury, over the surface of a smooth piece of copper." Philosophical Magazine, No. 35, p. 19, &c.

The white metal buttons which are composed of brass alloyed with different proportions of tin, after having been cast as before mentioned, are polished by turning them in a lathe, and applying successively pieces of buffalo skin glued on wood, (or buffs as the workmen call them) charged with powdered grindstone and oil, rottenstone and crocus martis. They are then en suite-boiled, that is, boiled with a quantity of grain tin in a solution of crude red tartar, or argol, and lastly, finished with a buff with finely prepared crocus.

Glas buttons. These articles are also frequently wholly composed of glas of various colours in imitation of the opal, lapis lazuli, and other stones. The glas is in the case kept in fusion, and the button, dipped out of it whilst in its plastic state, by a pair of irons moulds, like those used for casting pistol bullets, adapted to the intended form of the button: the workmen previously inferring the flanks into the mould so that it may become imbedded in the glas when cold.

Mother of pearl buttons. This substance is also frequently used in the manufacture of buttons; in which case, the mode of fixing in the flanks is somewhat ingenious. It is done by drilling a hole in the back which is under-cut, that is, larger at the bottom than the top, like a mortar, and the flanks being driven in by a steady stroke, its extremity expands on striking against the bottom of the hole, and it becomes firmly rivetted into the button. To these, foil-stones are also frequently added, in which case, they are usually attached with cinglas-glue. Steel studs are also often rivetted into buttons of this and various other kinds. See Foi-stones and Studs.

Shell buttons. This name is given to those buttons which consist of a hulk which is generally of bone without any flanks, but cored with catgut, and covered in front with a thin plate of metal struck with a die. They are now, however, much less in use than formerly. The backs are cut out with a brace whose bit is a circular saw, like that of a surgeon's trephine, and the four holes through which the catgut pales are drilled by four drills moving parallel to each other, and acting at once. They are then cored by children who tie the catgut on the inside; the cavity is filled with melted rosin, and the metal shell applied warm. The button is then profiled between two centres in a lathe, which are forced together by a weight acting on a lever, (an ingenious application of this engine frequently made use of in this manufacture), and the edge of the shell turned down during its revolution with a small burnisher.

In the year 1790, a patent was granted to Mr. Henry Clay of Birmingham for a new method of manufacturing buttons of flax, or flax fibre; and in 1800, Mr. Joseph Barnett of the same place obtained a patent for an improved mode of making buttons, by fixing two flanks, or other fastenings, on one button, one on each side, on the under surface, opposite to each other, instead of only one in the centre.

The practice of wearing buttons consisting merely of a mould covered with the same kind of cloth as the garment itself, being at present extremely general, it may perhaps be proper to remark, that this is prohibited on pain of pecuniary penalties, from 40s. to 5l. per dozen, by several statutes which have been made at different times for the prohibition of this manufacture; and under which, several convictions have taken place within a few years. These are, 10 W. 3. c. 2. 8 Ann. c. 6. 4 Geo. c. 7. and 7 Geo. c. 1. The importation of buttons is prohibited on pain of forfeiture, and penalty of 100l. on the importer, and 50l. on the seller, by 13 & 14 C. II. c. 13. § 2, and 4 W. III. c. 10. § 2.

By 26 Geo. III. c. 60, any person putting false marks on gilt buttons, engraving any marks except such as express the real quality, or any other word, except gilt or plated, incurs the penalty of forfeiting such buttons, and also 5l. for any quantity not exceeding 12 dozen; and if above, after the rate of 1l. for every 12 dozen. The penalty, however, does not extend to those who mark the words double and treble gilt, provided, in the case of double gilt buttons, gold shall be equally spread upon their upper surface, exclusively of the edges, in the proportion of 10 grains to the surface of a circle 12 inches in diameter; and in that of treble gilt, the gold shall amount to 15 grains in the same proportion. The penalty on making false bills of parcels, expressing any other than the real quality of such buttons, is 20l.; and that on mixing buttons of different qualities, forfeiture of the same, and 5l. for any number between one and 12 dozen, and above this number, 1l. for every 12 dozen. In order to ascertain what shall be deemed gilt or plated buttons, gilt buttons shall have gold equally spread upon the upper surface in the proportion of five grains to the surface of a circle 12 inches in diameter; and plated buttons shall have the superficialies of the upper surface made of a plate of silver fixed upon copper, or a mixture of it with other metals, previously to its being rolled into sheets or fillets. All pecuniary penalties may be recovered by action or suit within three calendar months, in the courts of Westminster, and one justice may, by warrant, cause metal buttons liable to
forfeiture, to be seized and kept in safe custody, to be produced as evidence upon any action, or cause them to be destroyed. Pecuniary penalties may also be adjudged by two judges in the place where the offender resides, or the offence is committed. This act, however, does not extend to buttons made of gold, silver, tin, copper, lead, or mixture of tin and lead, or iron turned, or of Bath or white metal, or any of these metals inlaid with fleec, or buttons plated upon shells.

Button, in Botany, a term sometimes used for a bud, in the technical language of the French naturalists; it is the middle flat between the eye and the cordon. Button, in Building, denotes a slight filling for a door or window, made to turn on a nail. Button of a lack, denotes a round head serving to move the bolt.

Button, in Chemistry, signifies the metal which is collected generally in a roundish mass at the bottom of a crucible after fusion, or which remains in the coppers after cupellation. Button, in Eucalyptus, signifies the end or tip of a foil, being made roundish, and usually covered with leather, to prevent making contusions in the body.

Button of the reins of a bridge, in the Meneget, is a ring of leather, with the reins put through it, running all along the length of the reins. See Bridge.

To put a horse under the button, is when he is flopped, having no rider on his back, by the reins being laid on his neck, and the button lowered, so that the horse's head is brought in by the reins, and fixed to the true posture or carriage.

Buttons, in reference to the Rigging of a ship, denote small pieces of thick leather under the heads of nails that are driven through ropes.

Button and Loop, a short piece of rope, having at one end a walnut knot, crowned, and at the other end an eye. It is used as a becket to confine ropes in.

Button's Bay, in Geography, lies on the west side of Hudson's bay, north of, and near to Churchill river. It is so called from sir Thomas Button, who, attempting to discover a north-west passage, lost his ship, and came home in a sloop built in the country.

Button-stone, are five small islands at the south end of Hudson's straits, near the north coast of Labrador, and near the entrance of cap Chidley. N. lat. 65° 18' to 65° 40'. W. long. 65° 10'.

Button Island, called also Bear island, an island of the Indian ocean, north of Java, and near Banca and Billiton. S. lat. 5° 49'. E. long. 105° 48' 30''. This island, as well as the Cap in the same longitude and S. lat. 50° 58' 30'', are deep and rugged, and difficult of access. At a little distance they appear like the remains of old castles, moniering into ruins, with tall trees growing upon the tops of them; but, at a nearer view, they exhibit traces of a volcanic origin. In the Cap are two caverns, running horizontally into the side of a rock, and containing a number of the birds' nests, so much prized by Chinese epicures. See Birds' Nests.

Button-flone, in Natural History, a kind of figured flone so denominated from its resembling the button of a garment.

Dr. Hook gives the figure of three forts of button-flones, which seem to have been nothing else but the filling up of three several forts of shells. They are all of them very hard flints, and have this in common, that they consist of two bodies, which seem to have been the filling up of two holes or vents in the shell. Polkh Works, p. 284. Dr. Plott describes a new species of button-flone, finely striated from the top, after the manner of some hair buttons, on which account it may be denominated porpises, unless we should rather take it for a new species of echinates. Hillt Ox. chap. 5. § 175.

This name is also given to a peculiar species of flate found in the marquifate of Barith, in a mountain called Vichtenberg; which is extremely different from the common sorts of flate, in that it runs with great ease into glas in five or six hours time, without the addition of any salt, or other foreign substance, to promote its vitrification, as other flones require.

It contains in itself all the principles of glas, and really has mixed in its substance the things necessary to be added to promote the fusion of other flaty bodies.

The Swedes and Germans make buttons of the glas produced from it, which is very black and shining, and it has hence its name button-flone. They make several other things of this glas, as the handles of knives, and the like, and fend a large quantity of it unwrought in round cokes, as it cools from the fusion, into Holland.

Button-tree, or Button-wood, in Botany. See Cephalanthus and Conocarpus. In North America the Platanus occidentalis is also called button-wood.

BUTTONNESS, in Geography, a cape of Scotland, on the south-east extremity of the county of Angus, in the German ocean, at the north-west of the entrance into the frith of Tay; 9 miles E. of Dundee. N. lat. 56° 26'. W. long. 1° 53'.

BUTTRESS, a buttment, or mass of flone, or brick, ferving to prop or support the sides of a building, wall, or the like, on the outside; where it is either very high, or has any considerable load to sustain on the other side, as a bank of earth, &c. See Arch, and Arc-boutant.

The theory and rules of buttresses, or props for easins walls, is ranked among the defects of architecture. They are usually placed leaning against the edifice they are to sustain. We find them used against the angles of fteeples, churches, and other buildings of stone; also along the walls of such buildings as have great and heavy roofs, which would otherwise be subject to thrust the wall out. They are also placed as supports against the feet of arches turned crofs great halls, in old palaces, &c. and are much used in fortification.

Buttress, Buttice, or Butteris, likewise denotes a tool, made of fleec and fitted to a wooden handle, used by farriers, to pierce the sole of a horse's foot, which is overgrown; to pare the hoof; to fit the shoe; and to cut off the skirts of the sole that overake the shoe.

BUTTS, William, in Biography, born towards the end of the 15th century, was educated at Gouville college in Cambridge, where he appears to have taken his degree of doctor in medicine. Being distinguished for his superior abilities, he was appointed physician to king Henry VIII.; and though he was not one of the founders of the College of Physicians, as Granger calls him, he was one of their early members, being admitted in the year 1529; and was in such repute for his learning, that Dr. Caius dedicated his works to him. It is also probable that he assisted the surgeons in procuring their charter, as his portrait is among those of the members who were present when it was delivered to the company. Goodall's College of Physicians. Aikin's Biog. Men. of Medicine.

BUTTSTADT, or Butzstett, in Geography, a town of Germany, in the circle of Upper Saxony, and principality of
of Weimar, situated on the Lothe, and carrying on a great trade in cattle with Poland and Hungary; 9 miles N. of Weimar.

**BUTUA, Budoa, in Ancient Geography, a town of Ilyria, named Butobac by Steph. Byz., and Butua by Ptolemy. See Budoa.**

**BUTUMTUM, or BYTONTUM, a town of Italy, in that part of Apulia called Peucetia, south-east of Bavium, on the Trojan way.**

**BUTUS, in Entomology, a species of Sphinx (Zygaena, Fabr.), the wings of which are greenish and shining, at the tips darker; abdomen fulvous. Fabricius. Inhabits South America.**

**Butus, Sphinx butus of Cramer, is the species described by Fabricius under the name of Gnota, which see.**

**Butus, or Butis, in Ancient Geography, a town of Lower Egypt, seated on the west of that branch of the Nile anciently called Hermopolitcus, and which running near to Schennytus, now called Samaone, discharges itself into the lake of Bourlos or Berelo. It was famous for a oracle of Latona, called Butis, and in some respects the fame with Isis, which was consulted by persons that repaired to it from all parts of Egypt. The temple of this divinity was spacious and magnificent; surrounded by a portico 50 feet high, which was supported by marble columns, and the sanctuary was formed out of an enormous mass of granite, 60 feet square and 6 thick, and weighing 15,000,000 pounds. It was hewn in a quarry in the island of Philæ, near the catacombs, and conveyed on rafts, through a distance of 200 leagues, to the place where it was deposited. Butus was also decorated with two temples in honour of Apollo and Diana. Herodotus, l. xi. c. 155. Strabo, l. 17. vol. ii. p. 800.**

**BUTZBACH, in Geography, a town of Germany, in the circle of the Upper Rhine, and principality of Upper Hesse, situate in a marshy, but fertile, plain; 7 miles S.S.W. of Gießen.**

**BUTZOW, a town of Germany, in the circle of Lower Saxony, and principality of Schwerin; 24 miles N.E. of Schwerin.**

**BUUDE, or BUDENSTADE, a trading place and fishing port of Iceland.**

**BUVETTE, or Beuvette, in the French Laos, an established place in every court, where the lawyers and counsellors may retire, warm themselves, and take a glass of wine by way of refreshment, at the king's charge.**

**There is one for each court of parliament, but these are only for persons belonging to that body; there are others in the palais whither other persons also resort.**

**BUXALOONS, in Geography, an Indian town of America, on the north-west bank of Alleghany river; nearly 25 miles from Fort Franklin, at its mouth.**

**BUXBAUM, John Christian, in Biography, applied himself solely to the study of botany, in which he acquired considerable celebrity. His first work, "Enumeratio Plantarum in agro Halens, locoque vicinis naecentum," was published in 1721 at Halle in Saxony, near which place he appears to have been born. Haller commends this catalogue, which contains many of the minuter plants, mosses, and fungiæ, some of which were then first noticed. This procured him so much credit, that he was sent for to Ruffia and made member of the academy at Peters burg. He then went to Constantinople, and visited several of the islands in the Archipelago, attentively examining all the varieties of plants, found in those rich countries. As the fruit of these travels, he published, in 1739, 4 to. "Centuria prima Plantarum circa Byzantium et in Oriente observatum. Petrop." in which he briefly described some new and many very rare plants.**

He died the following year, but had previously prepared a second, third, and fourth centuries, which were published in 1729, 1733, and 1740. A fifth century, with an appendix, was added. Besides these, he was author of several communications on the subject of botany, which were published in the first, second, third, and fourth volumes of the Commentaries of the Imperial Academy at Petersburg. Hall. Bib. Bot.

**Gen. Ch. Cepha. ovate, oblique, gibbous, on one side. Perigone double; outer one of sixteen teeth truncate, inner membranaceous, plaited.**

**Species, 1. B. aphylla. "Capsule on a fruit stalk; leaves none." Linn. Memo, 5. tab. 1. Dilig. Mufc. tab. 68. 5. Flor. Dan. 44. La Marc. Ill. Pl. 872. Fruit stalk swelling at the base into a black, somewhat villous, small bulb; half an inch long, dark, red, glofy, erect. Capsule of an uniform pale colour, ovate, gibbous, about the size of a common pea. The only moss known without leaves. Turner. Spic. Mufc. Hib. This curious plant was first discovered by Buxbaum on the banks of the Volga, near Alfran; afterwards by Mont in Italy, and Celsius in Sweden, both of whom sent specimens to Dillenius; and by Haller in Switzerland, and others in different parts of Europe. It has lately been found near the lake of Killarney in Ireland. 2. B. folio. (B. scillis SEMID. Hed. Phaenem Flor. dan. t. 249. upper fig. Phaeceum montanum Hib. Maximum Light. Sphagnum acaulem maximum Dilæ tab. 22. f. 13.) "Stem none; capsule nearly femail, leaves linear-lanceolate." Dr. Smith. La Marc. Illust. Pl. 872. f. 2. Eng. Bot. 329. Stem very short, or rather none. Leaves numerous, lanceolate, flat, keeled, acuminate; inner ones with a britlly tooth on each side towards the summit. Capsule solidary, nearly femail, the size of a grain of wheat, ovate oblique, smooth green; calytrix awl-shaped, red; lid conic, frilated; exterior fringe obsolete; interior membranaceous, white, plaited, cloved. Dr. Smith. A native of England, and other parts of Europe.**

**BUXE FLORE, in Geography, a bay on the west coast of Wett Greenland. N. lat. 64° 15'. W. long. 49° 40'.**

**BUXENTUM, now Policofera, in Ancient Geography, a town of Italy, in the eastern part of Lucania, called by the Greeks Pyrus. It was founded by Myceutus, a prince of Meglana in Sicily, and afterwards deferted. It was colonized by the Romans. Strabo, Livy. According to Strabo (l. 6. vol. i. p. 253.) Pyrus was the name of a promontory, port, and river.**

**BUXI, in Entomology, a species of Tipula (Tipula flavella of Schrank). The colour is yellow: head and thorax black; wings brown and incumbent. A native of Europe.** Gmel. &c.

**Bux, a species of Chermes, having fatoraceous antennæ, and yellowish brown wings, Pflya viridis, &c. Geoffroy.**

**BUXTEHÜDE, Dietrich, in Biography, son of John Buxtehude, organist at St. Olais at Elfinour, was a disciple of John Thiël, and organist of the church of St. Mary in Lubeck. Mattheison, in his Vollkommen Capellmeister, p. 130. celebrates him as a famous organist and composer, and speaks of six futes of lefions for the harpsichord of his composition, in which the motion of the planets is represented or delineated. With this is printed a choral composition to German words, being a lamentation on the death of his father. In 1696 he published two sets of finas a violins, viola
Mattheson, in his Life of Handel, tells us, that "he and Handel travelled together to Lubeck, upon there being a vacancy in an organist's place, and in the organ, composed several double fugues, *da monte not da piano.*" Butzlebode was then at Lubeck, and an admirable player on the organ; however, Handel's powers on that instrument astonished even those who were accustomed to hear that great performer.

Butzlebode, in Geography, a town of Germany, in the circle of Lower Saxony, and duchy of Bremen, seated on the Elbe, which fills the ditches. The fortifications have been raised: 16 miles W.S.W. of Hamburg.

Buxton, Jeredim, in Geography, a person deserving to be recorded on account of his singular memory and powers of calculation, was the son of a school-master at Elmton, a small village near Chesterfield, in Derbyshire, and born, probably, in 1704 or 1705. His education, notwithstanding the profession of his father, was so much neglected that he was never taught to read or write. His whole attention seems to have been absorbed by the different denominations and relative proportions of numbers to such a degree that he took hardly any notice of external objects, except with respect to their numbers. When any interval of time was mentioned to him, he immediately gave the amount of it in minutes; and he assigned also the number of hair-breadths in any distance that chance to be spoken of, although no question was proposed to him. To such a degree was he capable of abstraction and of fixing his attention, that no noise discomposed him, and that no incidental question or occurrence could divert his thoughts, or occasion any confusion, so as to prevent his renewing and purifying his calculation, which he performed by mere memory, without the aid of pen or paper. It would be endless to recite particular instances of his powers of computation, and of the methods he used for solving the most obscure and intricate questions relating to numbers. By merely flitting over a piece of land he could tell the contents of it as accurately as if he had measured it by the chain. His confluent application to figures prevented his making the smallest acquisition in any other branch of knowledge; nor did his ideas seem to be extended beyond matters of mere calculation.

In 1754 he visited London, and was introduced to the Royal Society, before which he gave several satisfactory evidences of his peculiar talents for computation. In this visit his curiosity was excited by a strong desire to see the king and royal family, but in this he was disappointed. At the play-house he seemed to be altogether uninterested by the splendour of the scenery or the action of the performers; and during the dances his attention was engaged in reckoning the number of steps. After a fine piece of music, he declared that the innumerable sounds produced by the instruments perplexed him beyond measure, but he counted the words uttered by Mr. Garrick in the whole course of the entertainment, and affirmed that in this he had perfectly succeeded. He was married and had several children. He subsisted by labour, and remained contented in obscurity; and prolonged his life to the age of about 70 years. Biog. Dict.

Buxton, in Geography, a large handsome village of Derbyshire, in England, is celebrated for its mineral waters, the fame of which occasions it to be much frequented by vulgarians, and many other persons, who resort hither for health, or pleasure. It is situated in two parishes, but the principal part forms a chapelry to Bakewell. Buxton lies in an extensive hollow, with bleak elevated tracts of moor land completely surrounding it. Several plantations have, however, been made of late years on the adjacent hills, and some land cultivated. The late Dr. Gale, as appears from a manuscript of his quoted in Gough's Additions to the Brit. Anna., placed the Aquis of Ravannas at Buxton, though he had previously conjectured it to be at Aidens, in Northumberland. That its warm springs were known to the Romans, is evident from various concurrening circumstances. Several ancient roads concentrate at this spot, particularly one called the Ithway, or Bathom-gate, which commences at Brough, a Roman station, near Hope, and was traced by the late Mr. Pegge; and another, that came from Manchester, and is known in different parts of its course by the appellations of High-street, Street-fields, Street-lane, Old-gate, &c. Specimens of Roman workmanship have also been discovered here at different times. Bishop Gibbon mentions a Roman wall "cemented with red Roman plaster, close by St. Anne's well, where are the ruins of the ancient bath." This wall was taken down in the year 1790, when Sir Thomas Delves of Cheshire, in memory of a cure he had received from the waters, erected a stone above over the well. Some capacious leaden cisterns, and different articles, apparently Roman, were found in digging the foundation. The shape and dimensions of the ancient bath, which was about six yards from the present bath-room, were clearly discovered when the building of the Crescent commenced in the year 1751. Its form appeared to be an oblong square; it measured from east to west thirty feet, and fifteen in a contrary direction. The spring was situated at the well-end; and at the east might be perceived a flood-gate, by which the water was let out. The wall was built with limestone, covered on the outside with a strong cement; the floor consisted of lime mixed with coarse sand, saturated with blood. Near one end a cavity was formed in the floor resembling the figure of a boat, extending circularly in length almost from one side wall to the other; its breadth was about two yards; and its depth below the level of the floor, at the deepest part of the curvature, about eighteen inches: the water was conveyed into this room by a leaden pipe. Though the very early use of the Buxton waters is apparent from the above circumstances, we have no record of their being in use in the middle ages, or of their having obtained any high reputation till the sixteenth century, when Dr. Jones gave them celebrity by a treatise on their beneficial qualities. About this time the earl of Shrewbury erected a house for the reception of visitors, on the site of the building now called "the Hall," part of which belonged to the old fabric. This hall becoming insufficient to accommodate the increasing number of visitors, most part of it was taken down in 1670, when a new enlarged edifice was erected on the spot by William, third Earl of Devonshire. This building, which has been frequently improved, is still the principal hotel for the reception of company. Within it are the baths, adjoining, but in distinct apartments, five in number; the gentlemen's, the ladies', the poor's, and two private. The springs have been calculated to throw up about sixty gallons of water every minute. The time requisite to fill the baths is two hours and fifty minutes. The water is usually drunk at St. Anne's well, a modern, but elegant little building in the antique style, where it is conveyed into a white marble bason, from the original spring, through a narrow grit-stone channel. This well is regarded as one of the seven wonders of the Peak; chiefly from the circumstance that both hot and cold spring water may be obtained within twelve inches of each other, from a double pump, situated on the opposite side of the building to that which contains the bason. The principal ornament of Buxton is its Crescent, a magnificent range of building, which was erected...
erected by the duke of Devonshire within the last twenty years, from the design and under the superintendence of Mr. Carr, the architect. It consists of three stories; the lowest ruffe, forming a beautiful colonnade, which extends the whole length of the front, and is seven feet wide, within the pillars and eleven feet high. The divisions between the windows above are formed by Ionic pilasters, which extend an elegant half-round that flanks the whole front, the span of which is 257 feet. The Crescent is built with grit-stone obtained near the spot, and faced with fine freestone, procured from a quarry about two miles distant. Near the back of the Crescent are the flabels, an extensive pile, which was also constructed at the charge of his grace of Devonshire, who is said to have expended 120,000l. in completing the whole. The poor who resort to Buxton, on bringing a certificate from the minister of their parish, and medical attendant, vouching for their being proper objects of charity, are admitted to partake of the benefit of a fund formed by collecting one shilling from every visitor who stays here more than a day. This is appropriated to the purchase of necessary medicines, and supplying fourteen indigent persons with six shillings weekly for one month; they are also permitted to bathe gratis. Buxton feafore generally commences in June, and concludes in October. In these months assemblies are held three days in the week, and a small theatre is opened on the other three days.

Buxton contains about 100 houses, chiefly of stone; the inhabitants, generally redundant, are about 400. The visitors in the bathing seafore are uncertain, but are estimated at 500 annually, who are the principal support of the inhabitants. Several shops for the manufacture and sale of ornaments of flour spar and alabaster are established in this village. The place where the crystals, denominated Buxton diamonds, are found, is about two miles south-west from the village: it is a waste piece of land, several acres in extent, and called the Diamond Hill.

Between one and two miles westward of Buxton, in the vast mafs of limestone, which ranges in this part of the country, is a fissure, or cavern, called Poole’s Hole, from an ancient tradition, that an outlaw, named Poole, once made it his residence. This being considered a great natural curiosity, we shall be rather particular in our description of it. Nothing grand nor picturesque marks the entrance into this cavity, neither does its interior present any of the magnificence which so eminently distinguishes the Peak cavern at Calleiton. It opens with a crevice so low and contracted that the curious visitor is obliged to proceed with caution in a sloping posture nearly twenty-five yards, when the passage widens into a spacious cavity, from whose roof depends a quantity of stalactite, produced by the droppings of water impregnated with calcareous matter. Part of this substance adheres to the roof, and gradually forms those pendant spiral masts called stalactites, or (locally) water-ladders; another portion drops with the water to the ground, and attaching itself to the floor is there deposited, and becomes the stalagmite, a lumpy mafs of the same matter. One of the former, of immense size, called the Pitch of Bacon, occurs about the middle of the cavern, which here becomes very narrow; but, after a short space, spreads again to a greater width, and continues large and lofty, till we reach another surprizingly large mafs of stalactite, to which the name of Mary Queen of Scots’ Pillar is attached, from the tradition of that queen having visited this cavern and advanced thus far into its recesses. As this pillar cannot be passed without some difficulty, few people venture beyond it; and, indeed, the remaining part of the cavern offers few objects to repay the fatigue of exploring it. The money given by visitants is divided among ten aged women who reside here, and act as guides by the permission of the duke of Devonshire, to whom the ground belongs. The extent of the cavern does not exceed three hundred yards.

The flume in this neighbourhood, though of several kinds, is usually applied to the making of lime, many hundred tons of which are here burnt annually. The workmen and their families, like the Troglodytes of old, reside in caves; for any other name would be ill-adapted to describe their habitations, which are scooped out of the hillocks or small mounts, formed with the refuse of the lime-kilns. The erust of these heaps of rubbish having been confounded by time and the weather, is now impervious to the rain; and being left of sufficient thickness, forms a subterranean roof. Each habitation contains two or three rooms; but few have any other light than is admitted through the chimney and door-way.

About three miles from Buxton and two from Chapel-inthe-Frith, in a pastoral field, is a natural curiosity, called “The Marvel Stones,” of which Mr. Bray gives a particular description in his Tour through Derbyshire, and to which probably Dr. Stukely alluded, when he mentions having heard of what appeared to him a druidical work near Hope. Near the northern extremity of this eminence called Combe-Mafs, three miles from Buxton, are some ancient military works, consisting of two deep trenches, which run parallel to each other to an extent of about two hundred yards.

**Buxton Water.** The native warm springs that have given so much celebrity to this town are very numerous, and afford a great abundance of water for every purpose both of bathing and domestic supply.

Buxton water is perfectly clear and colourless, entirely void of smell and taste; nor has it any quality, besides its temperature, which distinguishes it from the parcell of the numerous springs with which all mountainous countries usually abound. The heat is very uniformly 82° in all seasons and circumstances, taken in the flume reservoir which first receives it, and hence, though to the touch this water is positively cold, or rather cool, it is entitled to be considered as a warm spring, being uniformly of a much higher temperature than common springs. In St. Anne’s well, the original and principal reservoir, a quantity of thin steam is constantly given out from the water which hovers over its surface and contributes to keep up the heat during the bathing.

Along with the water, which rises up through the crevices of the floor of the well, a considerable number of air-bubbles are constantly seen to rise at the same time, and palling through the water break at its surface. These may readily be collected by immersing a bottle and funnel full of water in an inverted position and intercepting them in their passage upwards. Mr. Pearson was the first chemist who ascertained the nature of this gas, and he found it to consist almost entirely of azotic gas mixed with a small portion of atmospheric air, and not carbonic acid gas as had been conjectured by preceding observers. A small portion of the same gas also is found in combination with the water, which is readily separable by boiling. The water then yields about a sixty-fourth part of its bulk of this air.

The analysis of the water exhibits a few familiar substances, but in very minute proportion and perfectly insignificant; for, in fact, it is by its purity and warmth that this natural spring is distinguished. By Dr. Pearson’s experiment a gation
gallon of the water yielded on evaporation only 15 grains of red lead, or which 14 grains was estimated to be muriatic acid, 1/30 to be sulphate of lime, and 101/2 to be carbonate of lime; held in solution by a slight excess of carbonic acid.

The water of Buxton is employed largely both for external and internal use. Its uniformity of temperature and the great abundance of the supply give to Buxton uncommon advantages as a health resort. A flight shock of cold is felt on the first immersion, which is immediately succeeded by a very agreeable glow over the whole body; and it is to be observed that the shock is so slight, owing to the small difference between the heat of the water and that of the body, as to be borne without inconvenience by very delicate and irritable habits, in whom a rougher operation of the cold bath or immersion in the sea often occasions permanent head-ache, fickness, languor, catarrh, and other inconveniences.

There is not, however, the least reason to suppose any thing peculiar, or any occult salutary qualities in the Buxton bath, more than in any other pure water heated to 82° and confined in a fene referre for to retain the same temperature during the whole time of bathing. Therefore all the regulations and medical directions for its use may be entirely referred to the article Bathing.

Buxton water is also taken internally by invalids, and many important virtues have been attributed to it, thus used. That it contains nothing deleterious may be safely pronounced, both from the evidence of chemical analysis, and (what is more to the point) from the well-known fact that most of the water used at the principal hotels for making tea and other common purposes is derived from the same source. Therefore, whatever effects may be laid on its supposed inflammatory tendency in certain cases, it cannot be doubted but that to the reft of the world it is a pure, salutary, innocent beverage.

Like other warm pure waters it is highly advantageous in many painful complaints of the kidneys and bladder and urinary passages; like them it powerfully relieves many of the most distressing dyspeptic symptoms, and like them it shews no decided action on the bowels, its use being sometimes attended with diarrhoea, sometimes with the opposite state, which last generally demands the assistance of active purgatives.

The cafes for which Buxton is referred to are mostly chronic, such as gout, rheumatism, derangement of the biliary and digestive organs, diseases of the urinary passages, and the like, and it is no small additional recommendation to the invalid to be abundantly furnished with every thing that can contribute to convenience, comfort, and amusement.

**Buxton,** in Geography, a township of America, in the county of York and district of Maine, seated on Saco river; 16 miles north-westly from Pepperell-borough, at the mouth of the river, and 118 miles N.E. from Boston; containing 1564 inhabitants.

**Buxtorf, John,** in Biography, an eminent Hebrew scholar, was born at Camden in Welsphalia, in 1564. As to his religious persuasion, he was a Calvinist; and having settled at Basf, he was appointed by the magistrates prof. of the Hebrew and Chaldee languages, which he taught with great reputation till his death in 1629. In order to perfect himself in these languages, he obtained the affiance of many learned Jews, and thus acquired a predilection in favour of rabbinical learning. His works, in the department of literature to which he was devoted, were numerous, learned, and useful. Thref are as follow; viz. "Lexicon Chaldaicum, Thalmudicum, et Rabbinicum," Basf. fol. 1630; a small "Hebrew and Chaldaic Dictionary," compiled of words from the Bible only, 12mo.; "Theaurus Latinae Hebraicae," 2 vols. 8vo.; a small "Hebrew Grammar," much esteemed; the Leiden edition of which was reprinted by Leiden; a large "Hebrew Bible, with the Rabbinical and Chaldaic Paraphrases, the Massora, Tiberias, &c." 4 vols. fol. Basf, 1618 and 1619; "Syagapha Judica," a collection of Jewish modes and ceremonies, intended to expel the Jews, but abounding too much with purities intermixed with a mass of learning; "Institution Epitoliari Hebraica," a collection of Hebrew letters; "Concordantia Hebraica," 8vo. 1632; "Bibliotheca Rabbinica," with a treatise "De Abbreviaturi Hebra-um," Nouv. Dict. Hist.

**Buxtorf, John,** son of the preceding, was born at Basil in 1599, and directing his attention to studies similar to those of his father, he became professor of the oriental languages in his native city. Besides translations of some of the rabbinical writings, such as the Moch Neovoch of Maimonides, and the book called Cofi, he published "A Chaldaic and Syriac Lexicon," 4to. 1621; and having adopted his father's sentiments with regard to the Hebrew vowel points, he defended them against Ludovicus Capellus in a book entitled, "Tractatus de Punctow Voconum et Accentuum in Libris Veteris Tellamenti Hebraici Origine, Antiquitate et Authoritate," Basf, 1648; and afterwards in a more considerable work, entitled, "Anti-critica, seu Vindiciae Veritatis Hebraicae adversus Ludovicapi Capellia Criticum, quam vocat Sacram," Basf, 1653. He published likewise "Dif- fertationes on the Old and New Testament," "Exercitaciones Philologico-criticas," "Florilegium Hebraicum," and other works. He died at Basil in 1664.

There were two other Buxtorfs, John, James and John, successively professors in the same chair at Basf, and both writers on subjects of literature. In general, the school of the Buxtorfs has been reproached, notwithstanding its acknowledged learning, with too great predilection for the rabbinical doctrines; and their decisions with regard to the authority of the Hebrew points have been gradually losing ground, and have now comparatively few advocates, after having been very prevalent through Germany and other Protestant countries. Nouv. Dict. Hist.

* Male flowers prominent from the buds. Gen. Ch. Cal. perianth three-leaved; leaves roundish, obtuse, concave, spreading. Cor. petals two, roundish, concave, similar to those of the calyx but larger. Stam. filaments four, awl-shaped, erect, expanding, rather longer than the calyx, others erect, twin. Pyf. rudiment of a germ without style or stigma.

* Female flowers from the same bud generally single, surrounded by eight or ten males. Cal. perianth four-leaved, similar to those of the male. Cor. petals three, similar to those of the male. Pyf. germ roundish, obtusely three-corned; fyles three, short, permanent; stigma obtuse, bifid. Linn. Peric. capule globular, very smooth, gloify, coriaceous, three-grained, before it opens three-creaked, three-valved; valves two-horned; grains of a paper-like substance, two-valved, opening elastically. Seeds two in each cell, ovate, attenuated upwards, triangularly compressed, obliquely truncate at the summit, somewhat spongy, smooth. Gart. Eff. Ch. Male. Cal. three-leaved; petals two, rudiment
of a germ. Female. Col. four-leaved. Pet. three; styles three; capsule three-seeded, three-celled; seeds two in each cell.

Species. 1. B. bakeriana, La Marek. "A tree; leaves oblong-obovate, an inch and half long; flowers very long. Branches straight, four-cornered. Leaves opposite, on short decurrent petioles, entire, smooth, shining, concave. Flowers in large bunches; anthers linear. A native of Majorca, &c. Cultivated in the royal garden in Paris, but is tender, and does not endure severe frosts.

2. B. arborescent (Sempervirens, Lam.). "Leaves ovate-oblong, attenuated towards the summit; anthers ovate; stem arborescent." La Marek. A shrubby tree, from twelve to sixteen feet high. Stem twisted, branched. Leaves opposite, permanent, very entire, emarginate, shining, often reddish in winter. Flowers in small or moderate bunches; filaments not more than the sixth of an inch long. There is a variety with narrow leaves, as well as the next species, is said by Miller to be specifically distinct. Its wood is of a close grain, very hard and heavy, and on that account is much used by the turner, engraver, carver, mathematical instrument maker, comb, and pipe, or flute maker, and a variety of other artisans. A native of most parts of Europe, from Britain southward. It is found abundantly in the south of France, Savoy, and Italy, and in the temperate parts of Asia and America. In England it has given name to Box-hill in Surrey, Boxwell in Gloucestershire, and Boxley in Kent, all which are mentioned by Ray as producing it; but on account of the value of the wood, the quantity is now much diminished. Mr. Woodward has more recently observed it on the chalk hills near Dunstable.

3. B. suffruticosa, dwarf box. "Leaves small, oblong; stem a low under shrub." La Marek. agrees with Miller in treating this as a distinct species, though nearly related to the preceding. When suffered to grow freely, it never rises to a greater height than about three feet, and grows in thick, much branched tufts. Its leaves also are small, and rather ovate or roundish-oval, with a white line on their back, more strongly marked than in the preceding species. It grows wild in many parts of France, by the road sides, about villages, and in rocky waste places. It is singular that it does not flower when cultivated in England, and was never seen in that state by Mr. Miller, though encouraged to grow many years in the greatest luxuriance. La Marek does not mention this circumstance, nor, indeed, can it be supposed to be thus barren in France, where it is said to be truly indigenous. 4. B. myrsifolia, myrtle-leaved box. "Leaves small, oblong, rather narrow; stem a low under shrub." La Marek. It resembles the preceding in its size, but differs both in habit and foliage, not forming a thick tuft or bush, but having an elongated stem like a tree, with open branches; its leaves are rather narrow, with scarcely any appearance of a white line on their surface. A small branch in flower, communicated to La Marek, had no female flowers. Native place not known. Ence: Methodique. Box was formerly employed as a medic in various diseases, but in Ray's time was grown into diffus about on account of its offensive smell; and before his time even its medical virtues began to be called in question. Dr. Withering, however, has recently recommended it; observing, that an empyreumatic oil diffused from its flowers is often used as a topical application for the piles; that it frequently relieves the tooth-ache, and has been given internally in epilepsys, and that the powdered leaves destroy worms.

Propagation and Culture. The arborecent box was much admired by our ancestors on account of its being easily clipped into the shape of animals, and other fantastic appearances. It was in equal request with the Romans for the same purpose. The younger Pliny, in particular, gives a florid description of the pleasure grounds at one of his country seats, in which, among other curious devices, the letters of his own name, and of other words, were orderly expressed in rows of horn box. These extravagances have now given way to a fitter style in ornamental gardening; but box is still cultivated in our nurseries as a beautiful evergreen; and, left to its natural growth, is a pleasing addition to the shrubbery. It has the additional recommendation of thriving under the thickest shade, and is able to withstand the fiercest weather of our climate. The dwarf box is used to divide the beds from the walks of flower-gardens; and though it has been condemned as affording shelter for noxious insects, the same objection will lie, in some degree, against every other kind of vegetable bordering; but supposing it to be peculiarly liable to this inconvenience, the evil is considerably counterbalanced by its elegance and durability. It may be propagated by cuttings, layers, and seed. The cuttings should be planted, about the time of the annual rains, at the distance of four inches from each other; they should be a foot long, and rather more than half of the length should be covered by the soil. A flip of the last year's growth, clipped from the wood, is an excellent root. The cuttings or slips may stand three years, and should then be transplanted into the nursery in moist weather, any time between August and April. The layers should be earthed between Michaelmas and March. This, as professor Martyn observes, is one of its natural methods of propagation, for when it breaks down by its own weight, or by a fall of snow, it sends out fibres soon after it has come into contact with the ground. The feed should be fown, as soon as it is ripe, on a light loam or sand in a shady border, and regularly watered. Some will come up the next spring, but some will lie in the ground till the next season. They should then have the same treatment as the cuttings. This is said to be the only method in which large trees can be raised. The best time for removing the tree is October. Martyn's Miller.

BUXY, in Geography, a town of France, in the department of the Saône and Loire, and chief place of a canton in the district of Chalon-sur-Saône, and 8 miles S.W. of it. The place contains 1603, and the canton 14,089, inhabitants; the territory includes 277½ square miles and 31 communes.

BUY De Mornas, Claude, in Biography, was born at Lyons and died at Paris in 1783. He is principally known as the author of an instructive and useful Atlas of Geography and History, Paris, 1752 and 1770, 4 vols. 4to. He also published a Cofmography, on the same plan, in 1779.

Buy, in Geography. See Buxis.

BUYING, the act of making a purchase, or of acquiring the property of a thing for a certain price. Buying stands opposed to selling, and differs from borrowing or hiring, as in the former the property of the thing is alienated for perpetuity, which in the latter is not.

By the civil law, perfons are allowed to buy hope, from pretios emicis, that is, to purchase the event or expectation of any thing; e. g., the fish or birds a person shall catch, or the money he shall win in gaming.

There are divers species of buying in use among traders; as buying on one's own account, opposed to buying on commission; buying for ready money, which is when the purchaser pays in actual specie on the spot; buying on credit, or for a time certain, is when the payment is not to be presently made, but, in lieu thereof, an obligation given by the buyer for payment at a time future; buying on delivery, is when the goods purchased are only to be delivered at a certain future time.
BUZ

BUYING the resaful, is giving money for the right or liberty of purchasing a thing at a fixed price, in a certain time to come; chiefly used indring for shares in flock. This is sometimes also called by a cant name, buying the bear.

BUYING of titles. See MAINTENANCE.

BUYING the Small-pon. See SMALL-PON, Inoculation of.

BUYTRAGO, in Geography, a small town of Spain, in New Castile, on the confines of Old Castile, in front of which the mountain-stream Laoya winds along a deep rocky bed; while, on the other side, the town, with its towers and steeples, leaps romantically against a steep ascent in a reccefs among the mountains, that separates the two Castiles. These mountains are rich in minerals; and the environs of this city, which is episcopal, are famous for the wood which they furnish. It is 36 miles N. of Madrid, and 18 E. of Segovia.

BUYTRON, a town of Spain, in Andalusia; 27 miles N.W. of Seville.

BUZANÇAIS, a town of France, in the department of the Indre, and chief place of a canton in the district of Chateauroux, 11 miles W.N.W. of it. N. lat. 46° 38'. E. long. 1° 30'. The town contains 3,199, and the canton, 11,130, inhabitants; the territory includes 422 1/2 kilometres and 13 communes.

BUZANCY, a town of France, in the department of Ardennes, and chief place of a canton in the district of Vouziers, 2 leagues N. of Grandpré. The town contains 774, and the canton 875, inhabitants; the territory includes 265 kilometres and 24 communes.

BUZARA, in Ancient Geography, a mountain in the eastern part of the interior of Africa. Ptolemy.

BUZARAS, a town of Africa, in Mauritania Caepeliacis.

BUZAW. See Butza.

BUZERI, a people of Abyssia, in Cappadocia, on the west of the Euxine.

BUZES, a people of Africa, in Marmarica.

BUZET, in Geography, a small town of France, in the department of the Upper Garonne, 44 1/2 leagues N.E. of Toulouse. N. lat. 43° 47'. E. long. 1° 45'.

BUZIKIN, a town of Siberia, 220 miles E. of Eufeld.

BUZIM, a town of Siberia, on the Tchulim, 80 miles N.E. of Tomik.

BUZULEITSK. See Busulutsk.

BUZWARKA. See BeZara.

BUZY, a town of France, in the department of the Meuse, and district of Verdun, 13 miles E. of it.

BUZZARD, in Ornithology, the trivial name of several species of the falcon tribe, as, for instance, the common buzzard, falco buto, greater buzzard, falco gallinarius, American buzzard, falco borealis, honey buzzard, falco apivorus, Java buzzard, falco jucundus, &c.

BUZZARD, American, of Latham, red-tailed falcon of Arctic Zoology, is the Falco borealis; the cere and legs are pale yellow; the body is brown above and white below; the tail is of a pale rufous colour, having a transverse dusky or black narrow bar near the end. It inhabits North America, particularly Carolina. Its size is about that of the common buzzard.

BUZZARD, Honey. See Apivorus.

BUZZARD, Moir, falco arenarius, the milky arenarius of Aldrovand and Ray; and the byzard of Buffon, has the cere greenish, the body brownish-grey, the crown of the head, chin, axilla, arm-pits, or space below the root of the wings, and legs, yellow. It inhabits Europe, building its nest in marshy places, and subduing on aquatic birds, fish, and rabbits.

BUZZARD'S BAY, in Geography, a bay of America, in the state of Massachusetts, lying between 41° 25' and 41° 43'. N. lat. and between 70° 38' and 71° 10' W. long. This and Barnstable bay on the north eall form the peninsula, whose extremity is called Cape Cod. It runs into the land about 30 miles N.E. by N. and its mean breadth is about 7 miles.

BUZZARDET, in Ornithology, the whitish falcon, Falco albidus.

BYAREM, in Geography, a town of Hindostan, in the country of the Nizam, 85 miles N.E. of Hydrabad, and 60 E. of Warangole.

BYBASSUS, in Ancient Geography, a maritime town of Asia Minor, in Caria, probably situated in the country called by Pliny Abydus.

BYBE, a country of Thrace.—Alfo, a town of Italy, on the confines of Pennectic. Steph. Byz.

BYBERRY, in Geography, a township of America, in the county of Philadelphia, and state of Pennsylvania.

BYBLIS, in Ancient Geography, a mountain of Asia Minor, before the town of Miletus.

BYBLOS, or Byblus, a maritime town of Phoenicia, situate between Beirut and Botrys, 18 miles S. from Tripoli according to the Itinerary of Antonine. The ancient inhabitants of this town served in all the maritime expeditions of Tyre, and as they excelled in all arts relating to wood, they were employed in building Solomon's temple at Jerusalem, 1 Kings chap. v. At this time they were subject to the Tyrians; but when Phcenicia was reduced under the dominion of the Persians, they had their own kings. According to Arrian (de Exped. Alex.) their ships formed a part of the fleet of Darius: but when Alexander had entered Phcenicia and made himself master of Byblos, they deserted Darius and united their naval force with that of Alexander. Under the succesors of Alexander, Byblos sometimes belonged to Egypt and sometimes to Syria. Strabo informs us (l. 16. vol. ii. p. 755), that Pompey reduced them from the oppressive tyranny of one of their overlords by cutting off his head. From him we learn, that it was feated on an eminence at a small distance from the sea, and that it was the royal residency of Cinyras, and that it was the seat of the famous superflition practised in its temples in memory of Adonis. See Adonis. The river Adonis flowed from the adjacent mountains, and passing by Byblos, discharged itself into the sea about two leagues S. of the town. This river, called Ibrahim and Ibrahim Bâha, has only the bridge to be seen, that of Tripoli excepted, from thence to Antioch. It confines of a single arch, 50 feet wide and upwards of 50 high, of a very light architecture, and appears to have been a work of the Arabs. Byblos is now known by the name of Djebail or Gibyle, and is the most considerable town in that district of the pachalid of Tripoli, denominated Kefroman, and extending from Nahr-el-kelb, by Lebanon, as far as Tripoli. It has not, however, above 6000 inhabitants. Its ancient port reembles that of Latakia or Laudicea, but is in a worse state; scarcely any traces of it remaining. Volney's Travels in Egypt and Syria, vol. ii. p. 176.

Byblos, a fortified place of Egypt, seated on the Nile. Steph. Byz.

BYCE, Buges, or Sacra Palus, in Geography, a lake of Cherthonius Taurica, in European Sarmatia, to the west of the Palus Alcstis, from which it is separated by an illmuse. It is mentioned by Ptolemy, Pliny, and Strabo, who alludes to it a circuit of 4000 fidaa.

BYDEAS-KIRCHE, a town of Sweden, in Uppland, near Umea.

BYEFIELD, a parish of Newbury, in Essex county, and

flate
of Maine-shutesett's. North America, having a quarry of lime-bone, in which is found abalone, and, in its vicinity, beautifully variegated marble. A flourishing woollen manufactory is also established in this place, together with machinery for cutting nails.

BYGLAND, a lake of Norway, in the diocese of Christianfand, and district of Raabyg, basen, formed by the river Otsera, on the west side of Byggeland, and precipitating itself at the water-fall of Tenne, in the parish of Ege.

BYHORS, an island of the East Indies, lying well of Boneco.

BYK, a river of European Turkey, which runs into the Dnieper, 6 miles N. W. of Bender.

BYLAWS; those private ordinances of subordinate communities by which their affairs are governed and regulated; the rights of the individuals composing them defined; and wrongs relative to their joint concerns, prohibited and punished.

The word is formed from the Saxon by, habitation, will, and laec, q. d. lex, villa, or town-law. They are also called burh-laws, bylaws, and burk laws, bilager, or bellegines. Such is the custom in Kent of deciding controversies among neighbours about boundaries, by the senechals, or bailiffs.

In Scotland, those are called laws of burk, or bylawn, which are made and determined by neighbours, elected by common consent in burk-courts, wherein cognizance is taken of complaints between neighbour and neighbour. The men thus chosen as judges or arbitrators are called burlaw-men, or bylawn-men.

Every body of men united by common interests, and having affairs of common concern, must necessarily have some general rules for the regulation of their conduct with respect to them. Without these nothing like unity or concurrence of action could possibly exist, whatever were the objects of the association. These regulations may be divided into two classes, with regard to the nature of the body to which they relate. Societies which are formed merely by the voluntary association of their members must have their rules or by-laws, as well as those communities which have a known description, and are recognized as forming part of the general constitution of the country; the former, however, receive no aid from the general law of the land in the enforcement of obedience to their rules, and have no ultimate remedy for their infraction but the expulsion of the disobedient member; whereas, the general law will enforce obedience to the by-laws of the latter, when in themselves legal and reasonable, and duly made on a subject within the jurisdiction of the legislating body. Thus, the inhabitants of a parish or town not incorporated may make a by-law for the repair of the church or of a highway, or concerning any thing within their district of which the public weal requires the regulation, and in such case the majority shall bind the whole. 5 Co. 63, a. 3 Salk. 76. The refiants in a leet, or the tenants of a manor, may make a by-law relative to any thing which concerns the common interest; as, in the latter case, to regulate the exercise of their rights of common. Mo. 779, 584. 1 Rob. Abr. 366. 2 Rob. 212.

From what has been already said, it will naturally be inferred, that this power, which is, under some circumstances, conceded even to such bodies as are not incorporated, null, a forini, belonging to such as are; the very existence of whole rights depends on that of the body itself, and does not arise, as in the former case, from those of the members considered as individuals. This right of legislation belongs originally, unless it be otherwise specified in the charter of incorporation, to the body at large; but they may afterwards delegate it to a feudal body, who then become the representatives of the whole; and may exercise this authority as extensively as the community itself might have done. Rex v. Spencer, Burr. 3 Salk. 1837. In many instances, however, this power of making by-laws has been originally vested in a feudal body by the same charter by which the corporation itself was created, and in this case, it seems that the body at large does not possess it. Rex v. Head, Burr. 2531. The king may, if he pleases, at the time of creating a new corporation aggregate, enact a code of by-laws by which it shall be governed; as may also the founder of an ecclesiastical corporation, each having a right to regulate on what terms alone the creature of his bounty shall be endowed with existence; but neither the one nor the other can afterwards, without express reservation of such right or the consent of the body, change or alter such code; nor will such by-laws, as to their general legality or operation, have any other force or effect than they would have had if enacted by the corporation itself. Skin. 513. Hob. 210.

With regard to the substance of a by-law, it is not only necessary that it should not militate against the express provisions of the law of the realm; but it must also be reasonable and consistent with its general principles, which reasonableness and legality are to be determined by the judges of the superior courts, whenever its validity shall come in question before them. To state the various possible cases in which a by-law would be void, would be therefore to enumerate all those provisions, and the principles and maxims on which they are founded. We shall, however, mention a few of the most general cases in which ordinances of this kind have been held to be invalid. A by-law cannot direct the forfeiture of goods, 8 Co. 125, a.; or the levying of money on any subject, except in those cases in which a burthen is to be borne by a particular society of which he is a member; as in that already mentioned, of afflicting parishioners or townsmen, for the repair of a church or highway. Jeffrey's Case, 5 Co. 66, a. Nor can it operate ex post facto. 1 Keb. 738. Or alter a constitution given by the crown. Rex v. Breton & an. Burr. 2260. It must not operate in restraint of trade. Harrison v. Godman, Burr. 22. Hesketh v. Braddock, Burr. 1847. 1 Roll. Abr. 363.; though it may regulate it and prohibit fraud. 5 Co. 51, b. Nor can it direct a penalty to be fixed for in a court in which the jurors must necessarily be interested as members of the corporation. Burr. 1855.

As to the power of a by-law to bind those who are not members of the legislating body, there seems to be a distinction between those corporations which are invested with a local jurisdiction, and those which, being established for purposes with which locality has no connection, have only a jurisdiction over their own internal concerns. When the corporate body has a jurisdiction over a certain territory, a by-law made by them for the public good, and whose object is general, without being limited to people of any particular description, binds every body coming within the limits of the jurisdiction, whether strangers or members of the corporate body; for every man, says Holt, who comes within the local jurisdiction of a corporation must take notice of their by-laws at his peril. Skin. 35.

This right of making by-laws for their own government, not contrary to the law of the land, was allowed by the law of the twelve tables at Rome. But no trading company is, with us, allowed to make by-laws, which may affect the king's prerogative, or the common profit of the people, under penalty of 421. unless they be approved by the chancellor, treasurer, and chief justices, or the judges of assize in their circuits; and even though they be so approved, till, if contrary to law, they are void. Stat. 9 Hen. VII. c. 7. 11 Rep. 54.

BYLAZORA, in Ancient Geography, a town of Europe.
in Peonia, advantageously situated on the confines of Macedonia and Dardania. It was taken by Philip, and is mentioned by Livy, Polybius.

BYLOT's bay, in Geography. See Raffin's bay.

BYLIE. In Ancient Geography, a Syrthian nation bordering on the west of Imus, according to Ptolemy, and corresponding to BARTISTAN or Little Thibet, which see.

BYNG, George, in Biography, lord viscount Torrington, an eminent naval officer, descended from an ancient family in Kent, was born in 1666. At the age of 15 he entered into the sea-service; but quitted it in three years, for the purpose of serving under general Kirk, governor of Tangier, who advanced him from the station of a cadet, first to that of an ensign, and then to a lieutenancy. In 1684, he returned to the naval department; and in the following year, he was in great danger of losing his life by engaging and boarding a Zinganian pirate; which sunk with him, so that he was taken out of the sea in a wounded state, and almost expiring. In 1688, being on board the fleet that opposed the landing of the prince of Orange, he was confidentially employed in negociating its surrender to the prince's party. Soon after he was raised to the post of captain, and served under admirals Rooke and Ruffell in the Channel and Mediterranean. In 1700, he had the command of a third rate at the taking and burning of the French fleet at Vigo; and in the following year he was made a rear-admiral, and served with Sir Cloudesley Shovel in the Mediterranean, by whom he was deputed to negociate a peace with the Algerns. In 1704, he commanded the squadron that attacked and massacred the garrison of Gibraltar, and induced a capitulation; and he so much distinguished himself in the battle of Malaga, that, as a recompense of his services, he was knighted by queen Anne. In 1705, he was dispatched with a squadron of 20 ships of war for the relief of Barcelona, and he performed various important services on the coasts of Spain and Portugal during that and the following year. On his return home he was signalised from shipwreck, when Sir Cloudesley Shovel, under whom he served, was lost on the rocks, called the "Bishop and his Clerks." In 1708, he was advanced to the rank of admiral of the blue, and commanded a squadron that was employed to prevent an invasion of Scotland by the pretend.r, by means of a French army from Dunkirk. He pursued the French fleet to the Scotts coast, and obliged it to return without landing its troops. Soon after his arrival in London, he was appointed to the command of a fleet destined for a defeat on the coast of France, and in the same year he had the honour of conducting the queen of Portugal to Lisbon, where he received a commission appointing him admiral of the white, and a very valuable present from her majesty of her picture set in diamonds. In 1709, he commanded a squadron in the Mediterranean; and on his return he was made a lord of the admiralty. But disapproving the measures of administration towards the cfole of the queen's reign, he was removed. However, on the accession of George I. he was reinstated in his office, and created a baronet. In 1717, when an invasion of Great Britain was projected by Charles XII. of Sweden, Sir George was sent to the Baltic with a fleet, which joined in concert with the Danes, and remained there till the Swedes had abandoned their design. In the following year the Spaniards landed an army in Sicily, and Sir George Byng was deputed with a fleet to counteract their operations. This was conducted in a manner that redounded very highly to his reputation and to the honour of the British flag. Upon his arrival in the bay of Naples, he found that the Spaniards had made themselves masters of the town of Messina, and were engaged in the siege of the citadel. The English were obliged, by their treaties with the emperor, to defend the Sicilians; but as England and Spain were not at war, the admiral attempted to negociate with the Spanish commander a cession of fortifications; his efforts, however, were ineffectual, and he proceeded, according to his instructions, to make use of force. Having deferred the Spanish fleet, consisting of 27 sail of ships of the line and frigates, he commenced the attack; and in the running fight which ensued, took seven Spanish ships. The admiral's being one of them, and several more were afterwards captured and destroyed by a detachment under captain Walton, who, in the licentious style of an officer, who valued himself more in performing than in describing a gallant action, informs the admiral, "We have taken and destroyed all the Spanish ships and vessels which were upon the coast, the number as by margin." The damage sustained by the English fleet, which, indeed, was of somewhat superior force, was very considerable. The Spaniards complained of being taken by surprize, and when they had no apprehension of hostilities. The conduct of Sir George Byng, however, who executed the orders with which he had been entrusted, was not censurable; and the action was very important to the flate of political affairs at the period in which it occurred. The admiral remained in the Mediterranean, affrighting the German troops to recover Sicily, and preventing the escape of the Spanish troops, till all affairs were settled, and the court of Spain had acceded to the quadruple alliance. The talents displayed by the admiral on this occasion, both as a negociator and as a commander, were such as to inure the confidence of all parties. Upon his return, his services were rewarded with the office of treasurer of the navy, and the rank of rear-admiral of Great Britain; and in 1731, he was raised to an English peerage by the title of viscount Torrington and baron Byng of Southill, Bedfordshire. He was also created a knight of the bath in 1723. On the accession of George II. he was placed at the head of the admiralty, in which station he died of an illness, in January, 1735, in the 70th year of his age. He had several children, one of whom was the unfortunate admiral John Byng, executed upon a rigorous sentence, for defect of duty, in 1757. Biog. Brit.

BYNNI, in Ethnology, a species of Cyprinus, distinguished by having thirteen rays in the dorsal fin, the third of which is thick and horny: tail linear, bifid; beams or cirri, four, Forks. A fish of a silvery colour, and oblong oval form, that is very common in the Nile. The length is about one eighth; the flesh excellent.

BYRAM. See Baram.

BYRAN, in Geography, a river of North America, forming part of the western boundary of Connecticut, and falling into Long island found, opposite to Captain's Islands.

BYRAN, a town in America, in Charles county, Maryland, about 9 miles E. from Hert Tobacco, and 24 S. E. from the Federal city.

BYRD FORT, lies on the eastern bank of the Monongahela river, on the south side of the mouth of Red-Bone Creek; 35 miles S. from Pittsburg, and about 59 N. W. from tributary Falls. Near this spot stands the central part of the town of Brownsville. N. lat. 40° 56'. W. long. 81° 12'.

BYROM, John, in Biography, a poetical writer, and inventor of a new short hand, was born at Kesal near Manchester, in 1601; and having finished his course of grammar learning at Merchant Taylor's school in London, was admitted a pensioner of Trinity college in the university of Cambridge, in 1578. To logic and philosophy he directed only that degree of attention which was necessary to qualify him.
him for his degrees; but his predominant inclination was to
poetry; and of his talents in this way, the first public spec-
cimen appeared in his beautiful pastoral, "Colm to Phobe,"
printed in the 8th volume of the Spectator, No. 763; the
two letters on dreams in the same volume, 585 and 592, are
also ascribed to him. Mr. Byrom, having taken both his
degrees in arts, was chosen fellow of his college in 1714, and
by the sweetness of his temper and the sobriety of his
manners, recommended himself to the particular notice of Dr.
Bentley, the master. His fellowship however terminated in
1716, on account of his not having entered into holy orders;
and leaving college, he went abroad and resided for some
time at Montpellier for the recovery of his health. In
France he became acquainted with Father Malebranche's
Search after Truth, and some pieces of Mad. Antoinette
Bourignon; and he returned home prepossessed in favour of the
vivious philosophy of the former, and the enthusiastic
extravagance of the latter: indeed, towards the close of his life
he feems, by some of his poems, to have been attached to the
mythicism of Jacob Boehmen. Whilst he was deliberating
what course of life to pursue, his mind became more unset-
tled in consequence of his passion for an amiable coufa, who
encouraged his addresses, and whom at length he married
against the consent of his parents. This connection involved
him in difficulties; and as he obtained no assistance from her
father, who was in affluent circumstances, he was reduced to
the necessitv of seeking support by teaching short hand, ac-
cording to a new method which he had invented at Cam-
bridge. He began at Manchester, and leaving his wife with
her relations at that place, he removed to London, where he
professed his instructions in that art, deriving from them for
several years a competent subsistence. In this art he was a
competitor with Welfton, who challenged him to a trial of
skill. In this contest he gained a decisive victory; and in
consequence of it, he was encouraged by a great number of
pupils, several of whom were persons of rank and quality;
and he occasionally read a lecture upon the history and
utility of short hand, which, being interspersed with various
strokes of wit that were natural to him, was very entertain-
ing. His winter months were devoted to this employment
in London, and he spent the summer season with his family
at Manchester. In March 1724, he was chosen a fellow of the
Royal Society. At length the family estate at Kerfual
developed upon him by the death of his elder brother, with-
out issue. By this accession of fortune he was enabled to
enjoy, without these interruptions which his former employ-
ment had occasioned, the conjugal felicity to which his own
dispofition was adapted, and to which the faithful and af-
fecitonate attachment of his wife very eminently contributed.
During the latter part of his life, he almost wholly devoted
himself to the composition of various pieces in verse, some of
which are witty and humorous; and others, the most nolent,
are on serious subjects. He was so accustomed to the
language of poetry, that his diffulations on learned and
critical questions were written in verse. These were collect-
ed in September, 1773, and printed at Manchester in two
volumes, 1110 mo. Mr. Byrom cloded an innocent and in-
offensive life with renagnion and cheerfulness at Manchester
in September, 1763, in the 72d year of his age. Some time
before his death, he is said to have committed several of his
lighter pieces to the flames; and therefe were of such a na-
ture that they deferve the character expressed in a dialect of Ovid,
adopted as the motto of Mr. Walker's works:
"Non ego versi diilinxi carmine quemquam;
Nulla venenato cell: litter mixt: joco." 

By the great truths of Chriftianity his mind had been so
much impressed in his early years, that he derived his chief
pleasure from employing his pen on religious subjects. Mr.
Pegge,(Arched, vol. x. p. 127. 128) has thus delineated his char-
acters: "Mr. late worthy friend, Mr. Byrom, whose memory I
shall always venerate, was undoubtedly a man of parts and learn-
ing, but rather too fond of some of paradox. Among his other
qualifications, he had a particular knack at verification,
and has accordingly delivered his sentiments on this subject
(viz. the History of St. George) as well as on all others, in a
metrical garb; for, I presume, we cannot truly call it a po-
tical one."--Bp. Bnt.

BYRON'S boy, in Geography, lies on the north-east coast of
Labrador.

Byron's island, a low flat island in the Pacific ocean, about
22 miles in length. S. lat. 1° 18'. E. long. 174°.

Byron's Strait, a narrow ica which separates New Ireland
from New Hanover.

BYRINUS, in Entomology, a genus of colloquial insects
having the antennae elevated and the club perforated;
palpi, or feelers, equal and somewhat elevated; and both the
jaw and lip bifid.

The species of this genus are gigan. pilula, eter, dorfa.is, varius, teres, nitidus, lactatus, and viridescens.

BYSSUS, in Geography, a town in Bohemia in the
circle of Baldlaw, 6 miles E. of Melnik.

BYSSUS, in Botany, Cereus; Gr. paid by Julius Pollux
a species of fuch, brought from India into Egypt: but
Pausanias and Philostratus describe it as the produce of a
tree, suppos'd by Dillenius to be the now well known woolly
infestation in which the seeds of gypiolium, or the cotton
tree, are enveloped. Dillenius seems to be the first among
the moderns who revived the name and applied it to a tribe of
plants till then either neglected or confounded with the
fungi and lichens. It appeared in his edition of Ray's
Synopsis, 1724, and afterwards more fully in his Hiftoria
Mufcorum, 1722; but had in the mean time been adopted
by Micheli in his Nova Genera, 1729.) Linn. gen. 1280.
down. Fructification unknown." The genus as it was formed
by Dillenius included species, some of which have the
appearance of very minute dull, others of fine wool; it is
accurately divided by Linnæus into two distinct sections.
Haller was of opinion that the powdery Byss is properly
lichens; Dr. Withering, in the third edition of his Botani-
cal Arrangements, has actually placed them in that genus;
and Dr. Smith was once inclined to entertain the same idea,
(See English Botany, p. 192.) but on further consideration
he has adopted Achard's new genus lepraria for all the
species that have no shells, and appear to be pre-
parated by their powdery part. (See Eng. Bot. p. 124.)
Supported by such respectable authority we have made the ne-
cessary alteration in the generic character, and shall insert in
the present article only such as consist of real filaments.

"Hair-like, very foft, parallel, very easily broken, pale."

Flaky Snow Byssus; Dil. Muc. tab. 1. fig. 9. It consists
of unbranched threads so tender and light that the breath
will disperse it, and when handled seems to dissolve into water
from the moisture attached to it. Found in damp caves and
vaults, most luxuriantly on bins or wooden flares where
wine has been spilt, hanging down in form of a jelly bag, to
the length of a foot or more. Withering. 2. B. flos aquae,
Naturalists are divided in opinion concerning this subfiance.
Linnæus seems to have founded his specific character on the
observations of Bergius. Dillenius, by whom it was first
mentioned in a botanical point of view, in his edition of Ray's
Synopsis, compares it to powder, and says, that in spring it
covers flagrant waters with a very thin and even crust, not
like
like a conerva, consisting of threads, nor of any perceptible downy matter, but merely of a thin green lamina. Linnaeus, in his Flora Lapponica, published thirteen years afterwards, notices a green tannaceous Byllus intermingled with water, which Dilenum, ibid. filhus Meltemorum, quotes as a synonym of the green paper Byllus, observing that this plant also at first could not powderly matter, which afterwards unites itself into a membranaceous fulness, and when dry becomes white; it is the aquatic membranaceous Byllus of the Flora Lapponica, which Linnaeus himself in the Species Plantarum makes a variety of B. ros aq. Weir, in his Cryptogamia, affirms that it is not a real plant, but only unorganized vegetable matter, produced by the dislocation of putrid plants. Dr. Withering, on the other hand, believed that it will prove a conerva; for offering a pond in the plane of flowering, as the country people term it, he examined some of the water, but the particles floating in it were so minute, that even with the assistance of a very good microscope he could not satisfy himself as to their figure or structure. Two or three weeks later in the spring, he found threads not jointed nor branched, either straight or coiled up like a cork-treew. Some of this water kept in a glass jar, after two or three weeks more, let its coat its fulness, and then it began to appear like a conerva. The threads soon became much larger and assumed a jointed appearance. La Mare describes it from actual observation as consisting of short, feathered, extremely fine threads, forming a soft green crust on the surface of the water. 5. B. candida Liu. "Threads exactly and universally latticed." Ledetn. Micro. tab. 72. Found in fresh full waters, swimming like a kind of mucor or mould of a yellowish green colour. 4. B. phal donna Liu. "Downy, of a violet colour, and growing on rotten wood." Dill. tab. 1. fig. 6. Consisting at first of very fine short upright down; afterwards pressed close to the wood, clothasting it like a thin membrane or crust, taking a deeper violet colour. 5. B. velutina Liu. "Filamentous; green: filaments branched." Dill. tab. 1. fig. 14. Found on trees, rocks, and the surface of the ground in shady places, which it covers with a very fine short silky down, like velvet, of a beautiful green colour. 6. B. aurora Liu. "Filaments simple or branched, closely matted together, powderly, orange-coloured." Dr. Smith, Dill. tab. 1. fig. 16. Eng. Bot. 212. Fibres very fine, thick-set, erect. Found on calcareous rocks and banks, particularly in Derbyshire, and sometimes on damp lime-limeon buildings. It often uniformly covers a space of many inches in diameter, and looks like a fine piece of orange-coloured cloth or velvet, but the surface is sometimes more tumbled and broken, and it frequently grows in a branching manner, feathered over mofles. It lifts its beautiful golden colour in five or six weeks after it is gathered, and then becomes of a permanent greenish grey. Dr. Smith. 7. B. nigra Hud. "Filaments branched, matted, powderly black." Dr. Smith, Dill. tab. 1. fig. 78. Eng. Bot. 201. Said to be Dillenius, Dr. Rees says it from the well riding of Yorksire. It has been often found on shady overhanging rocks in the alpine parts of England, Scotland, and Wales. It forms patches of various sizes, perfectly black, and may easily be scraped from the stone. When gathered, it strongly resembles a piece of felt scraped from a hat, both in texture and colour. It consists of a mat of fine felt, but definite, branched filaments, often covered with an equally black, soft powder, which is probably the food, though it has not been observed to be produced at any particular season exclusively. Dr. Smith. B. purpurea. Low: inoff. (Rubia Puros. 2d. ed.) "Filaments erect, simple, or branched, p. refl. 94." Dr. Smith, Eng. Bot. 194. Filaments usually longer than the breadth of a hair, thick-set, in broad uniform patches. When much moistened these filaments become clotted together in clusters, and in that moist state exhale a kind of sweet scent, agreeing in this respect with the Byllus Iolitius of Linnaeus, which is however really a crucifolious lichen. Dr. Smith. Found by the Rev. Hugh Davies on the micaceous rocks of Anglesea, and by Mr. Lightfoot on the base of Abbot Mackimmon's tomb in Y comb-kill. 9. B. lucista Hudson. "Filaments branched, tawny." Dill. tab. 1. fig. 17. Filaments longer, more rigid and more loosely disposed than those of B. aurora. It retains its colour when dry. On putrid wood. 10. B. barbata Hud. (B. auristinae La Marech, jucuta Wurb.) Filaments upright, branched, bundled, with annual interruptions, tawny, with smooth, swelled, deeper-coloured tips." Dr. Smith. Dill. tab. 1. fig. 10. With. Bot. Ar. tab. 18. fig. 5. Ber. Bot. 701. It forms perennial, thick, tawny-coloured tusfs, from one to two inches high. The growth of each year is marked by a swelling and a darker colour in each principal filament or ftm. Young plants consist of a simple filament, regular and beautifully feathered at the summit. In fine specimens found by the right honourable Lady Elizabeth Noel to Dr. Withering, and Dr. Smith, the fowled tips were remarkably conspicuous, and, as her ladyship with great probability supposed, continued the fertilisation. These tips are smooth, transparent, and of a rich taw dry colour. In Dr. Withering's specimens, when examined in the microscope, they were observed to be filled with granules, and to be besipid with bristle-flapped tubes, pointing upwards. In Dr. Smith's specimens, which he conjectures were in a less advanced state, they had not the same appearance. On moist rotten wood. 11. B. candida Hud. "Filaments much branched: branches fuscilicated, white." Dill. in Ray's Syn. tab. 23: as it grew on an old stick in a cellar. Dill. Hill. tab. 1. A. on an oak leaf; B. on the half rotten foil of an old shoe. From a broadleaf, mucilaginous, villous base, spiring many slender branches, spreading more in breadth than in height, elegantly divided and subdivided, and ending sometimes in numerous capillary fibres, but generally in surfaces a little expanded without any determinate number or figure. Sublimate pure white, tawny, prefaced close to the sublimate on which it grows. Dill. 12. B. cryptarum Liu. "Capillary, perennial, aff- coloured, adhering strongly to the rock on which it grows." Dill. 1. 20. Filaments very tender, fott, greenish aff-coloured, an inch long, loosely disposed, so firmly attached as to be scarcely pulled off by the fingers. Liu. Filaments simple, dull white, brittle, diverging in a crowded manner from a centre, an inch and half long, and the thickness of a human hair. Dill.

BYSSUS, or Byssus, a fine sort of thready matter produced in India, Egypt, and about Ellis in Achaina, of which the richest apparel was anciently made, especially that which were by the Phis and both Jewish and Egyptian.

In reality, the ancients seem to have applied the name indiscriminately to any kind of matter that was spun and woven finer than wool: so that it is probable there were divers sorts of byssus. It is certain, that Aristotle gave the name byssus to the hair or tined threads of the pinna marina; whether it were on account of its resemblance to the byssus of which cloths were made, or whether it were that this was the true byssus itself. What countenances this latter opinion is, that the byssus of the pinna marina may be spun, and consequently there is little doubt but that in ages when silk was scarce, it might be used in the cloths of great men. Add, that this byssus, though grossly spun, appears much finer and more beautiful than wool, and comes not much short of silk. Stockings and other such manufactures are still made of it, which would be more valuable if silk were les
To spin this byssus, they leave it some days in a cellar to moil, and grow fast: after this they comb it to get out the impurities, and, Lastly, spin it as they do flax. Gouger, Hist. Anim. 1. 4. e. 6. Acad. des Sc. Ann. 1712, M. p. 224: others think that the byssus signifies a kind of very fine flax, which grew in Egypt or Judæa. Bochart, Phæleg. l. iii. c. 4. Others again are of opinion that it is cotton, or a mixture of linen and cotton. The probability of its being cotton is strengthened by the description given of the byssus by Polyaenus, which cannot be applied to any thing but cotton. This writer says (l. vii. c. 17), that this material came from a kind of nut which grew in Egypt, and also in India; that they opened the nut, extracted this substance, spun it, and wove it for garments. Philostratus (de Vit. Apollon. l. ii. c. 10) describes it much in the same manner. These characteristics agree very well with cotton. Arrian, Turtullian, and Mela, concur in representing the garments worn by the Indians as confitting of flax or wool, which was produced by the trees.

It is found in a kind of brown nut, which grows on a small shrub. Besides it seems evident from the analogy of languages, that the word used by Moses in describing Joseph's garment (Gen. xlii. 42.) meant wool. This is the opinion of some of the most learned interpreters and commentators. We learn farther from profane authors, that robes of cotton were very ancient in Egypt, and that they were worn only by persons of the gentile distinction. Phil. H. N. 1. xix. § 2. It is no less certain that robes of linen were also used in very ancient times; and it appears from the testimonies of Moses, that flax was cultivated in Egypt from time immemorial. Exod. ix. 31. D.ut. xxi. 11. Hence some have supposed that the ancient byssus was either a very fine sort of cotton, or a mixture of linen and cotton. Forcher "de Byssus Antiquorum," Lond. 1776, 8vo. This ingenious writer, in an elaborate dissertation on the subject, cites a variety of passages from ancient authors, from which he concludes that the byssus was a kind of flax, if it may be so called, which was obtained from plants and trees in India, Arabia, and Egypt, denominated by the barbarians "Golphiion," and corresponding to the modern cotton. He adds, that the ancients were acquainted with two species of cotton trees, the "Bombax" and "Goffyphium," both belonging to the Linneas class of monadelphia polyandra. The byssus of which Pliny speaks (l. xix. c. 11) and which he extols for its softness and whiteness, was the goffyphium, or white cotton; and that of which Philostratus speaks (ubi fapia), the colour of which was red, χαλκιον, was obtained from "Bombax." Obrecht, in his "Travels" (vol. i. p. 583) informs us, that the real flax was unknown in India and in Egypt, and yet in both these countries the same vegetables were cultivated and the same arts practiced. We often read, however, of flax (linum) in works pertaining to the Egyptians, as composing the textures of the priests and others, particularly when they celebrated the mysteries of Isis. What this substance was is explained by Pliny, when he says that garments of cotton were much valued by the Egyptian priests, "Velles inedé (Xyline) facerodthosus gratilissimé." The "velles xyline" were synonymous with the "velles byssine." Moreover, Plutarch (in Tivde and Herodetus, l. ii. c. 86) informs us, that the religion of the Egyptians enjoined their wrapping up dead bodies in flax woven with byssus. That this byssus was our cotton is evident from the authorities to which Mr. R. Foster refers; and it may be also inferred from the fillets which were bound round their mummies. Authors usually differ as to two sorts of byssus, that of Eliss, and that of Judea, which was the finest. Of this latter were the priestly ornaments made. Bon"
round form from their diversificated, little branches, hairy. Callycanthus is the name given to a genus of flowering plants. The flowers are small, white, and arranged in clusters. The leaves are entire.

In ancient times, the sea-coast of Thrace was inhabited by the Thracians. They were known for their seafaring culture and were skilled in maritime activities. The region was a hub for trade and commerce, connecting various parts of the known world at the time.

The sea-coast of Thrace was also known for its rich marine resources. Fish such as salmon, mackerel, and cod were abundant, providing a significant source of food for the local population. The coastal areas were utilized for fishing, and the waters were rich in nutrients, supporting a diverse marine ecosystem.

In conclusion, the ancient sea-coast of Thrace was a vital part of the Mediterranean world, with a rich cultural heritage and a diverse ecosystem that supported a thriving community. The region played a crucial role in the development of maritime trade and commerce, leaving a lasting legacy that continues to be explored and appreciated today.
large sums to the revenues of the city, which was crowded also with merchants, and supported by an active and flourishing commerce. Its port, sheltered on every side from tempests, attracted thither the vessels of all the Grecian nations; and its situation at the head of the Strait enabled it to float, or subject to heavy duties, the foreign merchants who traded in the Euxine, and to furnish the nations who drew from its benediction. Hence arose the constant endeavours of the Athenians and Lacedaemonians to engage this city in their interests.

Byzantium was founded, according to Eusebius (in Chron.) about the third year of the 5th Olympiad, while Tullus Hollius reigned at Rome. But Diiodorus Siculus (I. v.) affirms, that the foundations of this city were laid in the time of the Argonauts, about 1263 years before Christ, by one Byzas, who later reigned in the neighbouring country, and from whose name the city was called Byzantium.

This Byzas, if we may credit Euthalius (in Dionyf. v. 834.) arrived in Thrace a little before the Argonauts came into those seas, and settled there with a colony of Megarensians. Others say, that the navigator Byzas, who was famed for the son of Neptune, founded the city 656 years before the Christian era; and that his followers were drawn from Argos and Megara. See Scaliger Animad. ad Euseb. p. 81. Du-Cange Conflantinopolis, i. p. i. cap. 13, 16. Some ancient medals of Byzantium, which have reached our times, bear the name and head of Byzas, with the prow of a ship on the reverse, probably of that ship which brought him into Thrace.

Velleius Paterculus (I. b. c. 15.) alights the glory of founding this great metropolis to the Miletians and Ammians Marcellinus (I. xxi. 8.) to the inhabitants of Attica. Justin (I. xix. c. i.) says, that it was built by Panthias, king of Lacedaemon; but in this he must have been mistaken, since it is certain, that Panthias, the commander of the Lacedaemonian fleet, took it (about the year B. C. 476) from the Persians, who had made themselves masters of it before the king of Lacedaemon had ever been in Asia. (Thucyd. l. iii. Herodot. l. ix.) Panthias might probably have rebuilt and fortified it, whilst he continued in possession of it, and carried on a secret conspiracy with the Persians. It underwent many revolutions, having been sometimes subject to the Persians, sometimes to the Lacedaemonians, and also to the Athenians, who took possession of it about the year B. C. 407. About the year 340 B. C. Philip of Macedon laid siege to this city; but was compelled to raise it, and to retreat, by Phocion, the Athenian general. Its situation was justly considered by the ancients as the most pleasant, and also the most convenient, for trade, of any in the world; and it is therefore no wonder, that the possession of it should be an object of various and successive contes. After many vicissitudes, Vepfianus, A. D. 71, reduced Greece, which Nero had declared free, and likewise Lycia, Rhodes, Byzantium, Samos, Thrace, and Cilicia, to Roman provinces, alleging, that they were no longer capable of liberty, since they only made use of it to undo themselves by their interlaced divisions. In the contest between Niger and the emperor Severus, the former placed a numerous garrison in Byzantium, and the latter instead of pursuing his enemy and besieging him in this strong city, detached a large body of troops to Cyzicus, near which a battle ensued between them and the numerous army of Amurathus, which terminated in a defeat of this general, and obliged Niger to quit Byzantium, A. D. 194. Upon this Severus invaded the place abandoned by his enemy, and commenced a siege, which lasted three years. The bloody battle of Illus decided this contest; and the head of Niger was sent by Severus to his army, encamped before Byzantium, and exhibited to the besieged on the point of a spear; and from Byzantium it was sent to Rome, as the token and trophy of Severus's victory. Such were the strength of this city, its advantageous situation for defence, and the obstinacy of the besieged, that it was not subdued without many assaults and many falles, which render the capture of it one of the most extraordinary events in military history. On the side of the sea it was guarded by a harbour into which the current set with such violence, that those who attempted to approach the city in this way were obliged to pass under its walls. Although the walls were not high, the sea itself, and its rocks, were a sufficient barrier. On the land side, care had been taken to fortify it with high and thick walls, built of mason stones, cemented together with cramps of iron; and the whole circuit was flanked with towers built in such manner and at such distances, that they defended one another. Before and during the siege, the Byzantines had provided themselves with various machines of war, some of which hurled large beams and stones upon the besiegers on their approach, and others threw at them showers of darts and smaller stones to a greater distance. Strong iron hooks, fastened to chains were fastened to the walls, and fastened to the walls, and dragged up whatever they laid hold of. These machines were boldly confronted by one Pricus, a Bithynian, and a famous engineer; who, after the surrender of the place, was sentenced to death by the generals of Severus, but obtained his pardon of the emperor, in the prospect of deriving from his talents future services. The entrance of the harbour of Byzantium was barred by a chain, and upon the pier, which advanced on each side into the sea, were built towers for preventing the approach of an enemy. This harbour contained good small vessels, most of which were armed with pointed prows of iron; and some of them had two rudders, one at each end of the ship, and a double complement of men; by which means they could at a moment's warning, and without tacking about, either advance upon the enemy or fall back, as occasion required. Dion Cassius informs us, that the Byzantines successfully practised a stratagem for taking some of the enemy's ships, whilst they lay at anchor at some distance from the shore. They employed divers, who, swimming under water, cut the cable, and drove into the body of the ship a strong nail fastened to a rope, the other end of which was in one of their own vessels. This last, being put in motion, dragged the other after it, and it thus appeared to move without oars or wind. As the beleaguered lost many of their ships, they built others of the timber of their housetops, and the women cut off their hair in order to furnish materials for ropes. When their supply of darts and common stones failed, they made use of the stones of the walls of their theatres, which they demolished; nor did they spare the statues, even of brass, which adorned their city. Such was their direft by famine, that they were reduced to the necessity of soaking flings of leather, in order to derive some nourishment from them, and at length of devouring one another. In that situation of extreme indigence and misery, some of the most robust and vigorous took advantage of a storm to embark on board of their ships and to seek a supply of food for their fellow citizens, or to perish in the attempt. Having overloaded their ships, the Romans attacked them in their return; and either overtook or sunk them all, so that not a single vessel escaped. The Byzantines, thus deprived of their only hope, opened their gates to the besiegers, and surrendered at discretion. The conquerors showed them no mercy; but massacred all the soldiers, magistrates, and commanders; and by order of the emperor, who exulted with his soldiers on the capture of the city, the edicts of its inhabitants were confiscated; the city was deprived of its privileges and even of its title of city,
and was reduced to the condition of a mere village; so that it was subjected together with its territory to the jurisdiction of the Perinthians, who infamously abused their power. Its fortifications were totally dismantled; and thus Severus deprived the empire of one of its strongest bulwarks, which kept all Thrace in awe, and commanded Asea and the Euxine sea. "I saw it," says Dion Cassius, "in such a state of ruin and desolation as would have made any one think it had been conquered, not by Romans, but by barbarians." The emperor, at the request of his infant son, Caracalla, mitigated some part of its punishment, rebuilt a considerable part of it, calling it "Antonia" from the name of Antoninus, assumed by his son; but never restored it to its ancient privileges, nor revered the order by which it was subjected to the Perinthians; for we find by ecclesiastical history, that till the time when Constance rebuilt Byzantium and gave it his name, the bishop of this city acknowledged the bishop of Perinthos, or H. racela, for his metropolitan. In the year 262, the tyrant Gallienus exercised cruel vengeance on Byzantium for reasons which are not particularly specified; but the Byzantines having some ground for mistrusting him, first shut their gates against him; but afterwards admitting him upon his promise of moderation and clemency, he boldly broke his word, and caused both the garrison and inhabitants to be massacred; so that at the time when Trenchtius Pollio wrote, there was not an ancient family in Byzantium, except such whose accidental abode, occasioned either by business or pleasure, or by their being employed in the armies, had preferred some remains. On occasion of the war between Licinius and Maximine, Byzantium was besieged and taken by the latter; but it was soon after recovered by Licinius. But in 324 Licinius was defeated by Constance the Great, first at Adrianople and then at Chalcedon; and the cities of Byzantium and Chalcedon opened their gates to the conqueror. In the year 330, Constance resolved to enlarge the ancient city of Byzantium, and to make it the second, if not the first, city of the Roman empire. Accordingly he began by extending its walls from sea to sea; and while some of the workmen employed in rearing them, others were employed in raising a great number of stately buildings, and, among the rest, a palace equal in magnificence and extent to that of Rome. As he designed to fix his own court there, and was devout that the succeeding emperors should follow his example, and honour his new city with their ordinary residence, he spared neither cost nor labour to render it both beautiful and convenient. With this view, he built a capital and amphitheatres, formed a circus maximus, several forums, porticos, and public baths; and divided the whole city into 14 regions, securing the inhabitants by many wholesome laws, and granting them great privileges and immunities. By these means, Byzantium became, in a short time, one of the most flourishing and populous cities of the empire; while families flocking thither from all parts, especially from Pontus, Thrace, and Asea. Constance published an edict, importing that such as had lands in those countries should not be able to dispose of them, nor even leave them at their deaths to their heirs, unless they had a house in his new city. The common people were enticed thither from the most distant provinces, and even from Rome itself, by the emperor's donations, and the great quantity of corn, oil, and wheat, which was daily distributed among them. But however defirous the emperor was to see his new city filled with people, yet he did not choose it should be inhabited by any but Christians, and therefore he ordered all the idols to be pulled down, and their temples to be consecrated to the true God. He built, besides, an incredible number of churches, and caused crosses to be erected in all the squares and public places. When most of the buildings were finished, the emperor on the 11th of May, in the year 330, the 25th of his reign, caused this city, by a very solemn dedication, to be consecrated, according to Cædernus, to the Virgin Mary; but, according to Eusebius, to the God of Martyrs. It was on this occasion, that Constance styled the new city after his own name, "Constatinopolis," for the city of Constance, and like wife ("Leontia") or as others will have it, "New Rome." At the same time he put it on an equality with ancient Rome, granting it the same rights, immunities, and privileges, that were enjoyed by that metropolis. He established a senate, and other magistrates, with a power and authority equal to that of the Roman senate; and declared "New Rome" the metropolis of the east, as "Old Rome" was of the west. Constance having accomplished this great work, according to some in five, according to others in two years, fixed his residence in the new city, and never more returned to Rome. The removal of the imperial seat from Rome to Constatinopolis happened in the year of the Christian era 330, the 25th of Constance's reign, and 1128 after the foundation of Rome. Anc. Un. Hist. vol. xii. xiv. C. Crevoster's Roman Emperor, vols. viii. ix. x. Gibbon's Roman Emp. vol. iii. p. 1 &c. See Constantinople.

**BYZIA.** Viza, Visé, in Geography, a mean town of Turkey in Europe, in Romania, which was anciently the residence of the kings of Thrace, and which has still a Greek bishop. It is situated in a languishk of the same name, which extends outward from the foot of Mount Hæmus to the sea of Narmara. See Byzia.

**BYZO.** See Bizo.

**BYZONE.** See Bizione.

**BZOVIUS, or BOWERS, ABRAHAM, in Biography, an industrious and voluminous writer, was born in Poland in 1657, and having studied at Cracow, entered into the order of Dominicans. He afterwards read lectures in philosophy at Milan, and in divinity at Bologna. On his return to Poland, he taught and preached with great applause, and became principal of a college belonging to his order; to the advancement of which he very much contributed, by the erecting of churches and convents, by furnishing their libraries, and by reforming their constitutions. On his settlement at Rome, he became librarian to the duke of Bracciano; and having compiled "An Abridgment of Ecclesiastical History," taken chiefly from the annals of Baronius, he was induced to engage in the continuation of that work, and with this view lodgings were affixed to him by the pope in the Vatican. This work commencing in 1193, where Baronius had left off, was continued to his own times, and comprised in 12 volumes, folio, of which 9 have been printed; viz. 8 at Cologne, from 1610 to 1630; and the 9th at Rome in 1672. With a spirit similar to that of his predecessor he arrogates plentiful power to the papal see, and manifests the zeal of a credulous and partial advocate rather than the fidelity of an historian. By his abuse of the emperor Lewis of Bavaria, he excited the indignation and remonstrances of the duke of Bavaria, a descendant of the same house, who obliged him to make a public retraction. He also offended the Franciscans by his reproaches of Scotus, the "sulphur doctor," and by other acts of hostility; and he likewise gave great offence to the Jefuits. His work is, upon the whole, little esteemed. Bzovius wrote 3 volumes of the lives of the popes, and a great number of other works, which are completely sunk into oblivion. Having quitted the Vatican, he retired to the Dominican convent of Minerva, and died there in 1637-
The third letter, or second consonant of the alphabet, has two sounds, one like k, as in the word call; and the other like s, as in Cæsar. It has the former sound before α, ο, and a consonant; and the latter before α, ω, and γ. It might be omitted, says Dr. John fon, in the language without loss, since one of its sounds might be supplied by s, and the other by k; but that it prefers to the eye the etymology of words, as face from factus, captive from captivus. C, having no determinate sound, according to English orthography, never ends a word. C is formed, according to Scaliger, from the χ of the Greeks, by retrenching the I or upright line; though others derive it from the ד of the Hebrews, which has in effect the same form; allowing only for this, that the Hebrews, reading backwards, and the Lattin, &c. forwards, each have turned the letter their own way. However, the C not being the same as to found with the Hebrew קoph; and it being certain the Romans did not borrow their letters immediately from the Hebrews, or other Orientals, but from the Greeks; the derivation from the Greek χ is the more probable. Add, that F. Montfaucon, in his Palæographia, gives us some forms of the Greek χ, which come very near that of our C; this, for instance, C: and Saides calls the C, the Roman kappa. The second sound of C resembles that of the Greek Σ; and many instances occur of ancient interjections, in which Σ has the same form with our C. Gruter, vol. i. p. 71. vol. iii. p. 1020.

All grammarians agree, that the Romans pronounced their Q like our C, and their C like our K. F. Mabillon adds, that Charles the Great was the first who wrote his name with a C; whereas all his predecessors of the same name wrote it with a K: and the same difference is observed in their coins. In Latin MSS. the C is often substituted for Q, as cotâ in cotâtis, &c. and the use of C for K was very common among the Latins. By the negligence of copyists C is often put in the room of P in ancient MSS.; on some ancient medals of Sicily, particularly those of Gela, C occupies the place of Π, as LEÂGÎON for LEÂJÎON; and the Romans for a long time retained it in the room of G.

C was also a numeral letter among the Romans, signifying an hundred: according to the verse, "Non plus quam centum C litera fertur habere." Some add, that a dath over it, made it signify an hundred thousand. CC denoted 200,000, and CCC 300,000, &c.

In the Falli and Calendars C denoted the day on which it was allowed to assemble the Comitia.

C is also an abbreviation.

In proper names, C was used for Caïnus; as Cæsar, &c. Their lawyers used it single for Codicis or Consiliis, and double, CC. for Confiliibus. On some marbles a C reversed, C, denoted Catia.

C was also used in their courts, as a letter of condemnation, and flood for condemno; in opposition to A, which signified absolution. On this account the letter C was called "Littera trillis." Cicero pro Milone, c. 6.

C, in Musica, is the name of the second space in the base, the third space in the treble, and of every line on which the tenor or C clef is placed.

In the Guido scale or gamut, the C in the second space in the base is called C fa-it; its octave above, on the fifth line, C sol-fa-it, as is the C in the third space in the treble, its octave.

C sometimes, in Ital. Musica, stands for canto, as C is canto primo. It stands likewise, when placed at the clef, for common time, and, with a line through it, thus C, for cut time, or a quicker kind of movement.

In music of the 15th and 16th centuries, in specifying the time or moods, as they were then called, when triple time, which then was styled imperfect, and common time imperfect, the laws of prolacion were very complicated and difficult to comprehend. An O, or complete circle, implied perfect time, when, without apoint, a long Q was equal to three breves; a breve to three semi-breves, &c. and a C, or semi-circle, implied imperfect or binary time, which Morley calls "prolation of the left." See Moods, Prolation, and Time-table.

When at the clef a concealed canon, (cavato chiaso), had two different marks for time placed over each other, it implied, that one of the parts sung the notes as they were written, and the other doubled all their lengths, the upper part leads off the canon.

C B, when placed in a score over the viola, or tenor part, implies C Basso, with the base.

The French regard at as the representative of C, the first note of their gamut; but Guido, the Italian, and the English always look upon G on the first line in the base, as the first note in the gamut, or scale of music. See Hexachord, Proposition, and Solmisation.

In Gregorian notes on a stave of three lines only, C implies the tenor or C clef.

C, Album, in Entomology. See C, ALBUM.
C, Aureum. See C, AUREUM.

CA-APIA, in Botany, the Brazilian name for the Dorfema Brasiliensis of La Mareck, first described by Marggrave and Pits, and since found by Commeron, both in Brazil and Magellan.

CAAB, or Cab Ben Zohair, in Biography, an eminent Arabian poet, was at first a Jewish rabbin; and when Mahomet made war on the tribes which had embraced Judaism, wrote some severe satirical verses against him. But, on Mahomet's subsequent success, he was profelyted, and preferred
him with a copy of verses in his praise; upon which he was pardoned and received into favour. The impollor conferred on him the honour of his mantle, which was afterwards purchased at a great price by the caliph Moawia from his heir. Caab is said to have had a large share in the composition of the Koran. He died in the 1st year of the Hegira, A.D. 622. D’Herbelot.

CAABA, a square stone edifice in the temple of Mecca, supposed to have been built by Abraham and his son Ishmael; being the part principally revered by the Mahometans, and to which they always direct themselves in prayer. See Kaaba.

The word is Arabic, "kaaba, and "caaba, a denomination which Some will have given to this building, on account of its height, which surpasses that of the other buildings in Mecca; but others, with more probability, derive the name from the quadrangular form of this structure.

This edifice is indisputably so ancient, that its original use and the name of its builder are lost in a cloud of idle traditions. The Mahometans affirm, that it is almost coeval with the world, and they pretend, that Adam, after his expulsion from paradise, supplicated divine permission to erect a building like what he had seen there, called "Beit al Mamar," or the frequented house, and "Al Darah," towards which he might direct his prayers, and which he might compass as the angels do the celestial one. Upon which God let down a representation of that house in görünt of light, and set in Mecca, perpendicularly under its original, ordering the patriarch to turn towards it when he prayed, and to compass it by way of devotion. After Adam’s death, they say, his son Seth built a house in the same form, of stone and clay, which, being destroyed by the deluge, was rebuilt by Abraham and Ishmael, at the command of God, in the place where the former had stood, and after the same model; directions for this purpose having been given them by revelation. Independently of these fabulous traditions, it is not improbable, that it was erected by some of the patriarchs descended from Ishmael; but whether it was built as a place of divine worship, as a fortress, as a sepulchre, or as a monument of the treaty between the old professors of Arabia and the sons of Kedar, it is impossible to ascertain. Reland supposes that it was the mansion of some ancient patriarch, and on that account revered by his posterity. At length it came to be considered as a building appropriated to the service of the Pagan Arab divinities; but that it was not originally a temple seems to appear from these circumstances; that the door was not placed in the middle of the structure, and that, for many ages, there was no divine worship performed in it, though the Pagan Arabs frequently went in procession round it. It is most probable, however, that the Caaba was primarily designed for religious purposes; and it is certain, that it was held in the highest veneration long before the birth of Mahomet. Having undergone several reparations, it was, a few years after his birth, rebuilt by the tribe of Korei, who had acquired the custody of it either by fraud or force, on the same foundation; afterwards repaired by Abdallah Ebn Zobeir, the caliph of Mecca, and again rebuilt by Yufil, surnamed Al Hejaj, in the 74th year of the Hegira, with some alterations, in the form in which it now remains.

The length of the Caaba, from north to south, is 24 cubits, its breadth, from east to west, 23 cubits, and its height 27 cubits. The door, which is on the east side, is raised about 4 cubits from the ground, and the floor is level with the bottom of the door. In the corner next this door is the "black stone" so celebrated amongst the Mahometans. This stone is set in silver, and fixed in the south-east corner of the building, or that which looks towards Bafra, about 2 cubits and one third, or seven spans, from the ground. The Mollems pretend, that it was one of the precious stones of Paradise, and that it fell down to the earth with Adam, and being taken up again, or otherwise preferred at the deluge, the angel Gabriel afterwards brought it back to Abraham, when he was building the Caaba. It was at first whiter than milk, but became black by the sins of mankind, or rather by the touches and kisses of so many people; the surface only being black, and the interior parts remaining full white. The Hindoos, (see Asiatic Researches, vol. iv. p. 371.) maintain, that this black stone was no other than the "linga," or "phalus" of Maha-deva, an ancient divinity; and that when the Caaba was rebuilt by Mahomet (as they affirm it to have been) it was placed in the wall, out of contempt; but the newly converted pilgrims could not give up the worship of the black-stone; and insignificant portents forced the Muslims of the new religion to connive at it. Indeed, stones were worshipped not only in Arabia, particularly at Mecca, but were distinguished by the appellation of Beatles, (see Brvlos.) in Syria and Greece. It is also affirmed, that the black-stone was the object of an idolatrous worship from the most remote times. However this be, the black stone is held in very high estimation by the Mahometans, and is kissed by the pilgrims with great devotion, being called by some "the right-hand of God on earth." When the Karmatians profaned the temple of Mecca, and took away this stone, neither love nor money would induce them to restore it, though the inhabitants of Mecca offered no less than 5000 pieces of gold for it. However, after having kept it 22 years, and finding that they could not prevail with the pilgrims to abandon Mecca, they sent it back, with some contemptuous expessions, of their own accord. In the temple of Mecca is also the stone in Abraham’s place, on which, they pretend he stood when he built the Caaba, and bearing the traces of his footsteps; this is enclosed in an iron cell, and the Koran enjoins prayers to be offered before it. On the east side of the Caaba is the well Zemzem, which is covered with a small building or cupola, and the water of which bears the reputation of curing many bodily diseases, and even of washing away moral pollution and guilt. This water is much revered, as it is supposed to issue from the spring which supplicated Ishmael when his mother Hagard wandered with him in the desert, and is not only drank by the pilgrims on the spot, but conveyed in bottles to most parts of the Mahometan dominions. There is also a white stone, said to be the sepulchre of Ishmael, which is very ancient, and which was held in considerable repute among the Pagan Arabs. It is situated on the north side of the Caaba, within a semicircular enclosure, 50 cubits long, and receives the rain-water that falls off the Caaba by a spout, formerly of wood, but now of gold. The Caaba has a double roof, supported within by three octagonal pillars of aloes wood, between which are suspended, on a bar of iron, some silver lamps. The outside is covered with rich black damask, adorned with an embroidered band of gold, which is changed every year, and which is provided by the Turkish emperors. At some distance the Caaba is surrounded, but not entirely, by a circular enclosure of pillars joined towards the bottom by a low balustrade, and towards the top by bars of silver. Without this inner enclosure, on the north, south, and west side of the Caaba, are three buildings, which are the oratories, or places where the three of the orthodox sects assembled to perform their devotion; and towards the south-east flank the edifice which covers the well Zemzem, the treasury, and the cupola of Al Abbas. All these buildings are enclosed, at a considerable distance by a magnificent piazza, or square colonnade, resembling the Royal Exchange of London, but much larger, covered with small domes and cupolas, from the four corners of which rise as many minarets or steeples, with double galleries,
galleries, and adorned with gilded spires and crescents, as are the cupolas which cover the piazza and other buildings. Between the pillars of both inclosures hang a great number of lamps, which are constantly lighted at night. The first foundations of this outward inclosure were laid by Omar, the second caliph, who built no more than a low wall, to prevent the court of the Caaba, before open; from being encroached on by private buildings; but the structure has been since raised, by the liberality of many succeeding princes and great men, to its present height. The precipices of Mecca, to the distance of 10 miles from the Caaba, are considered as sacred, so that in thefe it is no lawful to attack an enemy, or even to hunt or fowl, or cut a branch from a tree; and they have long ago enjoyed the rights of sanctuary. The ceremonies prefcribed to the pilgrims on their arrival at Mecca, confift chiefly in procéssions round the Caaba, running between the mounts Safa and Marwâ, making the ilation on mount Arafat, flaying the victims, and flaving their heads in the valley of Minâ.

In compailing the Caaba, which they do seven times, beginning at the corner where the black-stone is fixed, they move in a quicfc pace the three first times of parambulating it, and make a more quicfc progres during the four ilall circuits; in conformity, as they say, to the instructions of Mahomet, who directed his followers thus to show themselves strong and active to cut off the hopes of the infidels, who had given out, that the inmoderate heats of Medina had rendered them weak. As often as they pafs the black-stone, they either kifs it, or touch it with their hand, and kifs that. At the clofe of the ceremonies, the pilgrims flay their victims in the valley of Minâ; and thefe must be fheep, goats, kine, or camels; part of thefe is eaten by themselves and their friends, and the refl distributed to the poor. Having concluded their sacrifices, they flave their heads and cut their nails, burying both in the confecrated ground, and then visit the Caaba to take their final leave of the sacred building.

These ceremonies, as the Mahometans allow, were obferved by the Pagan Arabs many ages before the appearance of their prophet; and were confirmed by Mahomet, with some few alterations. He ordered, that when they compaflled the Caaba, they fhould be cloathed, whereas, before his time, they performed this piece of devotion naked. Each tribe either found or introduced into the Caaba their domelife worship: the temple was adorned, or defiled, with 560 idols of men, engles, lions, and antelopes; and molt conftipated was the image of Hebal, of red agate, holding in his hand seven arrows, without heads or feathers, the in-struments and fymbols of profane divination. But Mahomet defroyed these idols, fancified the Caaba, and made it the chief place of refor and worship for all devout believers. With regard to the procession round the Caaba, Roland (De Rel. Mah. p. 123,) obferves, that the Romans had a ceremony of this kind in their worship: as they were ordered by Numa (see Plutarch on Numa) to ufe a circular motion in the adoration of the gods, either to represent the orbicular motion of the world, or the perfecuting of the whole office of prayer to God who is maker of the univerfe, or elfe in allu- sion to the Egyptian wheels, which were hieroglyphics of the intabilitation of human fortune. D'Hcrbocot. Bib. Or. Sale's Prel. Difc. to the Koran, p. 114, 122.

CAAMINI, in Botany, a name given by the Spaniards and to the finest fort of the Paraguay tea. It is the leaves of a shrub which grows on the mountains of Mara- caya, and is used in Chili and Peru as the tea is with us. The mountains, where the trees which produce this valuable leaf grow naturally, are far from the inhabited parts of Paraguay; but the people of the place know to well the value and use of it, that they constantly furnish themselves with great quantities of it from the spot. They used to go out on these expeditions many thousands together, and their country was left to the infults of their enemies in the mean time, and many of them perished with the fatigue.

To remedy these inconveniences, they have of late planted the trees about their habitations; but the leaves of these cultivated trees have not the fine flavour or the virtues of the wild ones. The king of Spain has permitted the Indians of Paraguay to bring to the town of Santfey, twelve thousand arrows of the leaves of this tree every year: but they are not able to procure so much of the wild leaves annually; about half the quantity is the utmost they bring of this; the other half is made up of the leaves of the trees in their own plantations, and this falls at a lower price, and is called tafko. The arrow is about five and twenty pounds weight; the general price is four piastres for the arrow, and the money is always divided equally among the people of the colony.

CAANA, in Geography. See KENNE.

CAANTJE, in Verkenflap, in Ichthyolog, the Aca- rauna of Margrave, Willughby, Ray, &c. and the Cha- tos o Nicricans of Gmelin, which fea.

CAAOPIA, in Botany, the Brasilian name of Hypericum baciforum.

CAAPEBA. See Cissampelus.

CAB, or KAB, denotes a Hebrew measure of capacity, equal to the sixth part of the fheaf, or an eighteenth of the ephah. Arbuthnot's Tab. Anc. Coins, &c. n. 14. and 15.

The cab of wine contained two English pints; the cab of corn, 2½ pints corn measure.

We also find mention of the cab as a dry measure, in Grecian and Roman writers: some make it equal to the Grecian choinix, and affect it to be the quantity of what a labourer eats per day, as assigned by Cato.

CABAÇOS, in Geography, a market town of Portugal, in Elvemadura, 4 leagues from Espinhal, and 4 from Thomar, situate on a plain in a pleasant country near the river Nabão, and almost encompassed by hills, which confilt partly of land-stone and partly of lime-stone. This town formerly belonged to the knights-templers, after the destruc- tion of which it was transferred to that of Chrift. The plain on which it stands is almost entirely covered with olive-trees, and in its vicinity are cork trees.

CABAIGUAN, a town of the island of Cuba, 35 miles S.E. of Villa del Princep.

CABAL, a name given to a sort of drink made of dried raisins. The manner in which the Portuguese make cabal is this; they take out the stones of about twenty pounds of raisins, and then bruising the raisins a little, they put them into a barrel of white wine, in the month of January or February, and let them stand till about Easter. It is then very clear and rich, luscious and palatable to the palate. It is recommended to fop coughs, and give strength to the stomach. It is worth while to try the experiment with the same proportion of raisins to the same quantity of our English eaver, which would probably prove a fine drink. Phil. Trans. No. 157.

CABAL, in English History, an appropriate appellation, distinguishing the infamous ministry of Charles II. and founded of the initial letters of their names, viz. Clifford, Ashley, Buckingham, Arlington, and Lauderdale. Lord Clifford was an undistinguished papist; the earl of Arlington, a concealed one; Buckingham was a debauchee, and reputed an atheist; Shaftsbury was a man of acknowledged genius, but, according
according to Burnet, a devil; though he possessed great knowledge of men and things, he frequently changed sides as his interest directed; and Lauderdale was a man of learning, and from having been almost a republican, became a tool of the prerogative, and disposed to concur in the most deplorable counsels; with scarcely any traces of religion remaining, though he called himself a Presbyterian, and manifested to the last an aversion to King Charles I. These were the men to whom Charles entrusted the conduct of his affairs; and who plunged the remaining part of his reign into difficulties, which almost proved fatal to his government. By their counsel and concurrence the king and duke of York were encouraged in their designs of introducing popery and arbitrary power; in order to which, a secret treaty was concluded with France; the triple alliance was broken; and a new war declared with the Dutch for destroying their commonwealth; and by this means the king had a plausible pretence for keeping up a standing army, which might serve to secure him in the exercise of an absolute authority over his subjects, to fet aside the use of parliaments, and to settle the Roman Catholic religion in the three kingdoms. At length, however, parliament interposed, A.D. 1674. Clifford, indeed, was dead; Shaftesbury had made his peace with the country party, and Buckingham was defirous of imitating his example; and Lauderdale and Arlington were exposed to all the effects of national retribution. Articles of impeachment were drawn up against the latter, which, however, were never prosecuted; and the former declined daily in the favour of the king, and became contemptible to the people. Thus ended the power of a juncto, that seemed to have formed a plan for overturning the constitution, and establishing upon its ruins unlimited monarchy.

**GENERAL**

*Clavus*, in *Natural History*, a name given by our Sussex miners to one kind of the iron ore commonly wrought in that country. It is a lumpy ore, of a brownish colour, with a bluish red, which is more or less conspicuous in different parts of the same mafle. It is usually found in thin strata, lying not far from the surface, and is not very rich in iron, but it runs very readily in the fire.

**CABALACA**, or *Xabala*, in *Ancient Geography*, a town of Albania, according to Pliny and Ptolemy.

**CABALARIA**, in *Botany*, Flor. Peru, p. 30. Claws and corolla, *pulchra diecia*. Gen. Char. Cal. small, per- simbling, campanulate, with five deep, oval divisions. Cor. wheel-shaped: tube very short; border divided into five oval segments. Stam. anthers five, inserted at the base of the segments of the corolla. Fil. ligula nearly fleshy, five- fided; germ superior, nearly round. Peric. drupe globular, one-seeded, with five oblong points. Male and hermaphrodite flowers on separate plants; the former differ from the latter only in having abortive stamens.

Eight species are described in the *Flora Peruviensis*. They are all shrubs, and are nearly allied to the genus *Sideroxylon*. Jussieu has separated one of them from the rest, and formed for it a distinct genus, which he calls *manghila*.

**CABALL, in *Ancient Geography*, a people of Africa, in Libya, situated in the interior of the country of the *Aegyptii*, according to Herodotus; who represents them as very numerous, and extending along the coasts of the sea towards the territory of Barca, and as adopting customs and habits similar to those of the inhabitants of the country adjacent to Cyrene.**

**CABALIA**, a country of *Aege Minor*, in *Lycaia*, in which were the towns of Oenoanda, Balbara, and Bubor, according to Pliny and Ptolemy.

**CABALISTE**, in *Commerce*, a term used at Thoulese, and in the whole province of Languedoc; and signifying a merchant who does not trade in his own name, but is concerned in the trade of another merchant in chief. See *Anonymous partnership*.

**CABALLARIA**, in *Middle Ages Writers*, lands held by the tenure of furnishing a horsemanship, with suitable equipage, in time of war, or when the lord had occasion for him.

**CABALLEROS, or *Cavalleros*, in *Commerce*, are Spanish wools, of which there is a considerable trade at Bayonne in France.

**CABALLI, among *Mystic Philosophers*, denote the phials or astral bodies of men who died any sudden or violent death, before the expiration of their predetermined term of life. The *caballi*, called also *caulare* or *cohates*, are supposed to wander as goblins or ghosts over the face of the earth, till their defined term is accomplished; being doomed to live out the time as spirits, which they ought to have spent in the flesh.

**CABALLINE, CABALLINUS, from the Greek *kapallai*, a horse, something relating to, or partaking of, the nature and qualities of a horse.**

**CABALLINE Albus. See ALBES.**

CABARITA, in Geography, a small island near the north
coast of Jamaica. N. lat. 18° 54′. W. long. 70° 30′.

CABARITA, a river on the south side of the island
of Jamaica, which runs into the sea about 1 1/2 mile W. from
Savannah la Mer.

CABAROS, or TITAN, the most western of the islands
of Hieres, E. of Toulon, on the coast of France, in the Me-
diterranean.

CABARRUS, a new county of America, in the district
of Salisbury, North Carolina.

CABASA, in Ancient Geography, an episcopal town
of Egypt, in the Delta, and the capital of the nome called
Caubage.

CABASILAS, NILUS, in Biography, a Greek, arch-
bishop of Thessalonica, flourished in the 14th century, and
wrote two treatises against the Latins. The design of the
first treatise is to shew, that the division between the Greek
and Latin churches is owing to the popes having refused
to submit the decision of controverted questions to an ecu-
cumenical council, and arrogating the decision to themselves;
and the second relates to the supremacy of the pope, and
attempts to prove, that though he holds his episcopacy of
Rome from St. Peter, he is indebted for his primacy to
laws, councils, and princes: it also denies the pope's infal-
libility, and his jurisdiction over other patriarchs. These
treatises, which are clear, methodical, and learned, were
first printed in Greek at London, without date; in Greek
and Latin at Baill in 1544; at Francefort in 1555; at
Hainault, with the notes of Salmarius, in 1606; and at
Amsterdam in 1645. This prelate was also the author of
a large work on the procession of the Holy Spirit. Du-
Pin. Molheim.

CABASILAS, NICOLAS, nephew of the former, and his
successor as archbishop of Thessalonica, was employed in
negotiations by the emperor Constantine. In opposition
to the Latins, he composed an acclamatio against them,
and a work "On the Proceedion of the Holy Spirit." He
also wrote "An Epistle of the Liturgy," in which he
delivers the doxologies of the Greek church concerning the
mass; and which was printed in Latin at Venice in 1545,
and at Antwerp in 1550; and in Greek and Latin in the
"Bibliotheca Patrum," Paris, 1624. In the fame "Bib-
ilotheca," is also included his "Life of Jesus Christ," tran-
slated into Latin, and separately printed at Ing-Dillacht,
in 1624. A translation of his work "Against the Ufury" is
also contained in the "Bibliotheca." In the sciences of mathe-
matics and astronomy, he is said to have surpassed all his
contemporaries. With respect to his character as a writer
he resembled his uncle. Du-Pin. Molheim.

CABBASOLE, PHILIP DU, a friend and frequent cor-
respondent of Petrarch, was born at Cavallion in Provence,
and became bishop of that city in 1344. As chancellor to
Sanche, queen of Sicily, he, conjointly with her, governed
that kingdom during the minority of her grand-daughter
Joan. In 1366, he was nominated patriarch of Jerusalem,
and was appointed by Urban V., cardinal and vicar-general
of the dioceses of Avignon. During the residence of the
popes in this city, he was entrusted by Gregory XI. with
the superintendence of the estates of the church in Italy.
He was also bishop of Sabiun. He died in 1372. A work
"De Nugis Curialium," and two books "Of the Life and
Miracles of St. Mary Magdalen," are ascribed to Cabisole.
Du-Pin.

CABASSUS, or CABESSUS. (Homer IIiad. i. xiii. v.
567.) in Ancient Geography, a town of Asia, in Armenia
Hellenicus refers it to Lycaia.

CABASSUT, JOHN, in Biography, a priest of the or-
atory, was born at Aix in 1604, and became director to
Cardinal Grimaldi, whom he accompanied to Rome, and
by whom he was persuaded to publish several works. He
was an indefatigable student, and confiding in his ad-
vise to all who applied to him with cafe of conscience. He
was professor of canon law at Avignon, and died at Aix in
1685. His works are, "Juris Canonice Theoria et Praxis,"
Lyons, 1660, often reprinted, and improved by the notes
of Gibert; in a folio edition, printed at Poitiers in 1738;
"Notitia ecclesiastica Conscientiarum, veternique
Ecclesiic Rituum," 1670, fol.; "A Treatise on Ufury," and
decisions on various questions under the title of "Homo
subsedive." Moreri.

CABATANUS, in Ancient Geography, a town of Ara-
bia Felix, in the territory of the Chatramotizes. Strabo.

CABAY, a name given by the Indians and inhabitants
of Ceylon and Arracan to garments made of silk or cotton,
ornamented with gold, worn by the principal perrons of
the country.

CABBAGE, in Botany. See Brassica rapa.

CABEAGE, in Agriculture. The name of a well known ef-
cient plant, of which there are several varieties cultivated
by the farmer, as winter and spring food for different forts
of live stock. It is a fort of culture that is of much con-
sequence on all the heavy soils which are too moil and
strong for the successful practice of turnip husbandry.
And another circumstance that adds to its importance is
the little danger that attends the crop, and the largeness of
the quantity of food that is produced; as it has been found to
be considerably more in proportion to the space of ground
that is occupied, than that of turnips. Mr. Young has ob-
erved that cabbages "flourish to very great profit on all
good soils, and have the particular property of enabling
the farmers of clays and wet loams, to winter more cattle
than those of lighter lands can effect, by means of that excellent
root, the turnip. The great evil of clay farms used to be,
"fays he, "the want of green winter food, which confined
their flocks to hay alone, and, consequently, prevented their
reaping those extended articles of profit, that arise from
numerous heads of cattle; and, besides the immediate benefi-
c from the cattle, they lost also the opportunity of raising
large quantities of dung, which never can be effected so
c well as by keeping cattle. But all those evils are by the
cabbage culture remedied, and the clay farmers put in po-
zeon, in many respects, of an equality with the turnip
ones. If the difference between a turner fallow-year on clay
and a turnip-fallow on light land be considered, it is im-
portant of this discovery will, he contends, be sufficiently
clear. Thirty shillings for an acre expense of the first, are
not an exaggerated calculation; but all is saved on the turnip
land, perhaps with profit; and the barley that follows the
turnips is probably nearly as good as that which succeeds
the turner-fallow clay. Supposing the following clover
and wheat equal to both, according to soil, till there re-
 mains a superiority in the article manure; for all that is
raised by the consumption of the turnip crop is so much fu-
rior to the clay soil. But reverse the medal; supposc
choose cabbages to be introduced on the clay, and the scene
is changed. That crop will exceed the turnips, yield more
profit, and enable the farmer to make more manure. For
these reasons, the recommendation of cabbages appears to
be extremely well founded, and consequently, those farmers
who possess the proper soils, cannot determine too soon to
enter on the cultivation of them. But there is another cir-
CAB
cumulance attending some sorts of cabbages, which make them highly eligible on all farms, which is, their lasting for deep feed longer in the spring. Ruta baga, turnip cabbage, cabbage turnip, and green borecole, are in perfection in April, and last even to May, the most pinching period of the year. Turnips will do no such thing; consequently, those farmers who prefers turnip soils, should on no account flight the culture of cabbages for this purpose."

In regard to the preparation of the land, the author of "Practical Agriculture" advises, that "as the roots of the plants run deep, and stand in need of a large proportion of nourishment, a considerable degree of pulverisation should be affected, and the soil be well loofened to a considerable depth. Those effects, he conceives, may be produced in the most perfect manner, by repeated deep ploughings, and exposing as large a surface as possible to the action of the frosts during the winter season, by laying the land up into pretty high ridges. Three ploughings are molly found sufficient for this purpose; but the number should always vary according to the nature and state of the land. When this sort of crop succeeds wheat, barley, oats, or beans, the land is generally ploughed up in the autumn by a pretty deep furrow, and formed into ridges of about three feet in width; in this state, it may continue till the spring, when it should be well broken down by harrowing in different directions. It is then to be ploughed again, but with some-what less depth than before. After this, as near as possible to the time of planting, the ground may again be well harrowed over, and a suitable proportion of good stable manure applied, as from fifteen to twenty-three horse cart loads to the acre; or where composts are made use of, from twenty to thirty, and immediately turned into, or inclosed in the middle of the ridges. After this is accomplished, the land becomes ready for the reception of the plants. In some districts, however, a practice prevails of spreading the manure upon the land, and turning it in with the first ploughing. In this way the ground is supposed to be prevented from becoming too open by the action of the manure, and the danger of the plants being injured in droughty seasons prevented. It is obvious, however, he thinks, that in this mode, much of the benefit to be derived from the manure must be lost by its remaining too long incorporated with the soil before the plants are put in, and that the great advantage of having it in its most active and concentrated state, immediately below the roots of the plants, must be wanting." It is stated in the "View of the State of Agriculture in Midlothian," that "in the vicinity of Edinburgh, in preparing for this crop, the ground is ploughed in November, and again in April following, and well reduced by harrowing, &c. It is then laid out in three feet drills, thirty cart loads of dung per acre being laid in the drills, which are then split with the plough covering the dung, and then rolled level, after which, the plants are put in." And the author of the "Agriculture of the County of Kent" conceives, that "the tillage necessary for cabbage is to plough the land in the winter six or seven inches deep, and to crofs-plough it in the spring in a dry season, and then after manuring with a good covering of rotten dung, before planting in June, to plough it again, turning over a furrow ten inches wide for planting upon." But in Suffolk, according to the account of the secretary to the board of agriculture, "the land is prepared by four ploughings: the first of which buries an ample quantity of dung, and forms the land a second time on three feet ridges to be planted upon."

Dr. Dickson, in his "System of Practical Agriculture," observes, that "in the field culture of cabbages, several different sorts are capable of being employed, but that those varieties that are most useful as cattle feed, and the most capable of withstanding the severity of the winters in this northern climate, are the Scotch, the drumhead, the American, and the open green cabbage, or spring kale. The first, when of the true firm flat topped kind, has been found to be wholly incapable of being injured by frosts, except in some cases a few of the outside leaves. The second sort, or true drum-head, is likewise extremely hardy, and more close in its texture than many other varieties, being of course very heavy in proportion to its size. It admits of being planted sooner than the large American cabbage, which in particular situations is an advantage. This sort is known in some districts by the name of the fellow low cabbage, but it would seem to differ from it in some respects. At this kind is not found sufficiently hardy to bear the effects of very severe frosts, a mixed flock is frequently employed, which is produced by planting it and the common red cabbage together, and after the feed pods are formed, cutting the latter, and leaving the former for feed. This mixed kind, which is of a deep green colour veined with purple, besides retaining the size of the drum-head, possesses the hardness of the red cabbage. The third, or American kind, has not only a large size, but continues good to a late period in the spring. The last, or kale sort is perfectly hardy, and capable of being converted to use as a cattle and sheep food at the latter end of April, or beginning of May, when other sorts of green food are extremely scarce, and difficult to be procured. But, besides these, the varieties known by the titles of the flat, Dutch, the Yorkshire, the Savoy, and several others, may, he says, be made use of where the climate is more mild."

The same writer also adds, that "the chief advantage of planting large sized cabbages in the field is that of being capable of being set out at such distances as to readily admit of their being cleaned and kept in order by the plough, without any loss being sustained in the quantity of the produce. Where the soil is not of great futility, and the expense of hand labour reasonable, the smaller sorts may, he thinks, be made use of with advantage."

Mr. Young, however, fears that "the great American cabbage, which thirty years ago was to be had, and which came to 50 or 60, and even Solb. weight is lost at present. And the great cattle cabbage, the great Scotch, the drumhead, the Dutch, and other sorts are not distinct varieties. A farmer should, he thinks, at first get the best flock he can, and then trust only to the feed he raises himself. At present he is inclined to believe, that the best sort to be procured is the large red cabbage. It comes to a good size, and is harder than most others."

In procuring feed for raising young cabbage plants, great care should be taken, that it be obtained from the most perfect plants of the different sorts, and such as have feedeed without any other variety of the same tribe blowing near them, as it is, perhaps, only in this method, that they are capable of being kept of a true kind. It may, therefore, in this view be of great advantage to have the plants intended to stand for feed, planted out by themselves in a piece of ground at a distance from the others, and well protected from birds. When feed of this sort is purchased, such as is now seldom should always be preferred, as it not only vegetates much quicker, but is more to be depended upon for a proper supply of plants. In dry seasons, steeping the feed in water, or some other liquid, may also be of utility. The beds on which the feed is fown should be of a good rich quality, well prepared by digging, and the application of manure; as where the soil is poor and not sufficiently en-
riched, the plants are apt to be weak and stunted in their growth, as well as much injured by weeds. Much injury also frequently arises to young cabbage plants from the seed being sown too thick; care should therefore be taken to have them properly thinned out whenever they come up in too thick a manner. One ounce or an ounce and a half of good seed may in general be sufficient for sowing a bed fourteen or fifteen feet long, and five or six in width, or for raising two or three thousand good plants; in which proportion, half a pound will afford more plants than are sufficient for planting an acre of ground. Mr. Young advises three ounces of seed to each square perch well raked in, and then a peck of foot sown over each foot of ground; and that when it is intended to cultivate these crops on a large scale, an acre of land should be inclosed for the purpose, kept well manured, and the seed drilled in at nine inches, for the convenience of weeding and hoeing.

In respect to the periods of putting the seed into the ground, they must depend much upon the intentions of the cultivator: where the produce is to be consumed during the winter months, as in December, January, or February, the seed should be sown in July the preceding year, and the plants be put out in March, April, and May, the following year; but if intended for consumption in March, April, or May, the seed should be put in about the latter end of February or beginning of March, in the former year, and the plants be set out in the first or second week in July in the same year. By continuing to sow with regularity in the months of February, May, and July, or August, succulent crops of young healthy plants may be secured, and the round of cabbage husbandry be effectually preferred. These periods of sowing and planting out should, however, be attended to with considerable exactness, in order to secure good and certain crops, and the seed-beds be well protected from birds. But that the cultivator may not be disappointed in the number of plants, it may be useful to sow a little seed at different times, at the distance of a few days from these periods, always chusing as moist a time as possible for the purpose. And by hallowing or protracing the time of transplanting, or setting out the crops, the growth of the plants may be so managed as to have them ready for use either more early or later, according as circumstances may require. The author of Practical Agriculture observes, that, "in both the spring and autumn plantings it is, however, the best practice to be sufficiently early, as in the former case the plants will have the great advantage of the spring showers, and be in less danger from the heat of the summer season; and in the latter, more fully established in the soil before the winter sets in, as the growth of the plant after September cannot in any degree be depended upon in field culture. Besides, from the length of time which is requisite for their attaining their full size, it must always be advantageous to have them set out early. They seldom arrive at their full growth in less than four months, where they grow in the most perfect manner. By sowing very early in the spring, and setting the plants out as expeditiously as possible, both full and forward crops may often be obtained. There is, however, in general, an advantage in the autumn plants, that though they be more liable to be injured in the winter by flags, and other causes, they are in a state to be planted out very early in the spring, while those of the spring sowings can seldom be set out till the summer is much advanced." In this culture different methods have been attempted, such as setting the plants to stand the winter in the field, and letting them remain in the seed-bed to be put out in the spring; the former is most advisable in mild winters and sheltered situations, as the crops will be much more forward; but in exposed situations, the latter may be adopted with more success. By sowing in May and June, forward crops of large cabbages may be procured the ensuing year, and celeri-cab for the following spring; but in this last intention they should be planted closer together than usual. In this way the loss of weight, and danger of cabbage crops in the winter months, are fully obviated. On the whole, the former the autumnal plants are put out in the field after the frosts are over, the better; and the spring plants should be placed out as soon as possible after them, as before the end of April. It is the custom of some nice cultivators to prick the plants out from the seed-beds, while very young, into other beds; and the practice is certainly very advantageous, not only in checking their too forward growth, but in rendering them more fit for transplanting out and left liable to run to seed when transplanted into the field. The expense and trouble of this operation are, however, too great, where the cabbage culture is conducted on an extensive scale, to admit of its being generally performed.

Another practice, adopted by the late Mr. Bakewell, and since employed by other cultivators, by which the inconvenience of waiting for a suitable moist time for setting out the plants, and the danger of their not succeeding under other circumstances, are avoided, is that of drilling the seed in where the plants are to remain at the proper seasons, as April, May, or June, and the following month. But the first is the most general in this mode of culture. The crops, in this system of management, should be put in after turnips, potatoes, beans, peas, tares, or others of the hoeing or cleaning kinds; the land being ploughed in ridges three or four feet in width in the latter cases, before the winter frosts, and before the time of drilling the seed, manure to the extent of from twenty to thirty cubic yards to the acre, according to circumstances, introduced by reversing the former ridges. After having remained in this state, secure from rain, a week or fortnight, when the foils are firm, harrowing should be performed, but under other circumstances the roller to which the drill is fixed will level them sufficiently, as they should not be reduced too greatly. In performing the buskins, the Northumberland drill is to be attached to a roller eight feet in length for four feet ridges, and six feet, where they are three, by means of a chain, hooks, and flaps. The roller thus covers the ridge that is drilling and that which is to be drilled by the next turn. Proceeding constantly in this way, the seed will be effectually covered by four pieces of Jack chain about two feet in length, which are fixed to the centre of the drill behind, and drawn after it, and deposited to the proper depth of about half an inch by weighing or on loading the drill. When the plants appear, if a slice of foot be drilled over them to the extent of ten or twelve bushels the acre, Mr. Young thinks it will be of great advantage in protecting them from the attacks of the fly. This, he supposes, may be very conveniently done by one hopper and a round of cups similar to those of Cook's drill, but larger, fixed to such a frame as that of the Northumberland drill.

There can be little doubt but that this method will be highly advantageous, as saving much labour and preventing the plants from being checked in their growth by transplanting, when the foils are sufficiently fine and mellow; but under other circumstances it cannot probably be wholly depended upon.

In planting out crops of this sort, care should be taken to have the buskins performed as soon as possible after the land has been well watered with rain; as in this case the plants much sooner establish themselves in the soil, and fewer
CABBAGE.

fewer vacancies are left, by their decay, to be afterwards filled. The plants are likewise much more readily raised from the seed-bed, and with much less injury to the roots, which is a matter of importance. The work is performed upon the land in a flat furrow, and also when raised into ridges by means of the plough; but the latter method is the more general, and ought probably to be preferred wherever the soil is much inclined to the retention of moisture. On the lighter and more dry soils the flat surface may, however, be more proper and useful, as preferring a due degree of moisture more effectually, especially in dry seasons.

In regard to the distance of planting, it must depend in a great measure upon the strength and goodhealth of the seed, and the natural size of the variety of cabbage that is employed; but in general it should be such as that the ground between them may be cultivated and kept clean by the plough, and yet admit of bearing a full crop. It is evident that where the plants stand thin they will attain a larger size, while in close planting there will be a greater number of plants upon the land, which may compensate for the disadvantage in the want of size. It seems probable that both cabbages and turnips may be set out too thin, as the increase of size is not always equal to that of number. It is the practice in some districts, where this culture is well performed, to set them out regularly at the distance of three feet each way, as, in this method the plough in cleaning and earthing up the crops, can be conducted both in longitudinal and cross direction, and of course the soil between the plants be not only stirred in the most effectual manner, but the earth most completely laid up to the roots of the plants, and their growth more fully promoted. Where the larger varieties of cabbage are employed, and the land is sufficiently strong, this may of course in general be the most advantageous distance; but where the smaller varieties are made use of, and the ground is of a less strong and rich quality, two feet and a half may be a more proper distance. Other cultivators follow a different practice, some preferring four feet by two and a half, while others advise only two feet by twenty inches, or even 18 inches. In the latter distances the cabbages are, however, under the necessity of being handled between the plants in the rows, the intervals only being cleared by the plough. The culture cannot of course be by any means so perfectly performed; the soil in the former method being wholly removed, except the small portions immediately about the roots of the plants, while in these much of it will remain untouched, and be not only left in a more foul condition for succeeding crops, but less beneficial in promoting the growth of the cabbages. The experiments and observations of Mr. Baker, in the cultivation of cabbages in the field, led him to recommend the following as the most suitable distances for the different varieties which he employed.

The nature of the soils on which they are cultivated is not, however, described.

For all the larger sorts of cabbages on the different sorts of strong rich soils, the most advantageous distances may be three feet each way, and on the more light soils two feet and a half. But for the smaller sorts, two feet each way on the strong soils, and eighteen or twenty inches on such as are light. Whatever distances may be thought the most advantageous, it is observed by a late writer, that it will constantly be necessary to attend to the manner of setting them out, the size of the plants, and the mode of taking them up from the seed-beds, as much depends upon these operations being properly performed. In setting the plants out in the ridge method, it is necessary to have them placed in lines as regularly as possible, according to the distances employed, along the middle or crown of the ridges, immediately upon the part in which the manure has been inclosed; as by having this accomplished in an accurate manner, they not only admit of being cultivated between with more ease and convenience, but derive the utmost possible advantage from the manure, and at the same time, from its being more concentrated, require a smaller proportion to be employed. The size of the plants is likewise a circumstance of consequence, as the large stout plants not only take root with more certainty, but are less exposed to danger from slugs and other causes. In removing the plants from the seed or other bed, for the purpose of being planted out, it is also of much utility to have their roots as little broken or otherwise injured as possible.

Moist or rainy weather is the most suitable for this operation; but in dry seasons it may be safely accomplished after the plants in the beds have been well watered. The number of plants that are employed must obviously be different, according to the distances at which they are planted; but from five to seven thousand are generally sufficient for an acre of land. In setting the young plants out into the ground, it is necessary to see that the labourers fix them well in the soil, by applying the mould firmly round their roots by means of the dibble, that they cannot easily be drawn out by taking hold of their uppermost leaves. The plants are mostly dropped at proper distances by women and children, and the dibblers follow, having a click for marking the distances with in an exact manner. In this way an ordinary labourer will plant a quarter of an acre or more in a day, and an expert gardener nearly as much more. In the course of a fortnight or three weeks, after the first setting out of the plants, it will be requisite to fill up all the vacancies that have been produced by the failure of particular plants; in performing which a moist time, if it be possible, should be fixed upon.

In respect to the expense of planting out and the other necessary operations in crops of this sort, it must be liable to vary greatly, according to the circumstances of the soil, and the fertilization in respect to labourers. In Suffolk, according to the writer of the corrected report of the agriculture of that district, it is in general about three thillings the acre, but in other places frequently a little higher, the whole charge of an acre being estimated in this way:

**Expence of cabbage culture on one acre.**

CABBAGE.

In this climate, the whole of the expense of manure is, however, it is observed, charged to the cabbage crop: but the advantage ought properly to be divided, which would lighten the expense considerably. From the increase in the prices of land and labour which has lately taken place, the expenses of this sort of cultivation will at present fland considerably higher.

In the after culture of this sort of crop, much advantage is derived from having the mould or soil frequently flurred and applied to the roots of the plants. It is, indeed, only by a due repetition of these operations, that the plants attain their most perfect size and growth. The buffaloes are accomplished by means of ploughs, hores, and hand-hoes. Where the plants are set out in a regular manner at sufficient distances, the work may be performed in the most cheap and effectual way by the use of the horse-hoe, or the common light wing-plough; but, where narrow distances are employed, it can only be well executed by means of the hand-hoe. Sometimes both the horse and the hand-hoe are made use of, as where the crop is planted close in the rows with wide intervals. It is observed, by an useful modern writer, that " the number of hoeings must in general depend upon the flate of the land and the nature of the season, but three will in most cafes be necessary. The fiirst should be givien about three weeks or a month after planting, according to the growth of the plants, and the second at an equal distance of time; the third may be repeated as the necessity of the crop may require, attention being constantly paid to keep the land perfectly clean from weeds, and the earth or mould well loosen and laid up to the plants. In the first operation, it is usual to turn the mould or soil from the plants, but, in the subsequent ones, to apply it up to them, which, where the plants are set regularly in squares at the distance of three feet, may be performed in both directions of the ground, in the most perfect manner. In this way the cultivator not only in a great measure avoids the heavy expense of hand-hoeing, but contributes to the growth of the crop in the most effectual manner."

In executing the work by means of horse labour, some make use of the horse-hoe, others, the double mould-boarded and common hoe ploughs; and it has been contended by Dr. Anderson, that it may be effected with equal exactness, and in an equally effectual manner, by any common light wing-plough. The author of "Practical Agriculture" observes, "that, after these hoings have been accomplished, the hand-hoe may be occasionally employed just about the roots of the plants, if there should be necessity. And where the crops are planted out at narrow distances, either wholly or in the rows only, it must altogether, or in a great measure, be dependent upon for the after-culture of the crops. In these cafes two or three hoings are most often found necessary. The expense of each hand-hoeing in such crops is, in general, from two shillings to half a crown, or three shillings an acre." And where the crops have been put in, in the drill method, they will require to be thinned out to proper distances in the rows as soon as the plants have attained a few inches growth, being afterwards cleared and moulded up in the same manner as those which are planted out in the common way.

These crops, like many others, are liable to be injured by the attacks of animals of the insect kind, at different periods of their growth. While the plants are young and tender in the feed-bed, the beetle, or fly, often greatly injures or destroys them. They, likewise, occasionally suffer in the feed-bed from the attacks of the caterpillar, produced by the cabbage butterfly (Papilio Brassicae), though much less frequently, as this insect makes its appearance, in general, too late to do much injury to field crops. Much harm is likewise done to cabbage-plant while young, on their being first planted out, by the flies, but afterwards they are little exposed to its attacks. The depredations of the fly or beetle, as well as the caterpillar, may, in general, be, in a great measure, prevented, by the sowing or dispersing of wood ashes, foot, or other similar matters, in a powdery flate, over the young plants, on the first appearance of the insects among them. But, "besides the attacks of insects on the leaves of the plants, cabbages are subject to a disease in the roots, in which they become swelled out and knobby, and the plants weak and of imperfect growth. This vegetable disease has been supposed to be cause by the attacks of grubs below the surface of the ground, and to be chiefly prevalent where the same sort of cabbages are grown and planted on the same spots of ground for several years together."

It has been remarked, that, "where care is taken to plant out the proper hardy sorts of cabbage, there is little danger of their being injured by the severity of the frosts during the winter months, as seldom more than a few of their large outside leaves have been found to suffer. Many of the hardy varieties of cabbage have, indeed, been found to stand the winter frosts equally, or even better, where there are frequent thaws, than those of the broccoli, or kale kinds; but the latter would appear better adapted as a green food, especially for sheep, in the early spring months, as it may be repeatedly eaten down or cut over, and by that means furnish a more full supply of food."

It has been remarked, "that, in respect to the quantity of produce that may be derived from an acre of land under a crop of this kind, it must depend in a great degree upon the quality of the soil, the proportion of manure that is employed, the method of culture, the goodness of the plants, and the favourableness of the season, about the time of planting them out." But that "it may probably, in general, be estimated at from twenty to thirty tons. In comparing the produce of cabbage crops with those of turnips in different modes of planting, and on different kinds of soils, it was found, taking the best part of the crops, that, at a medium, an acre of the former, on good land, well managed, produced twenty-five tons, and of the latter fifteen tons. The value of the crops must likewise be affected by various circumstances, as the kinds of live flock by which they are consumed, the manner in which it is accomplished, and the situation of the cultivator with respect to markets; but that, in common they may be calculated at from four or five to seven or ten pounds the acre, and in many situations considerably more."

It has been farther observed, in a late work, that "in the application or expenditure of cabbage crops, as they are often liable to a considerable diminution in the quantity or weight of food which they contain, by standing over the winter to the spring months, it may be the best and most economical practice to make use of them late in the autumn, while their leaves are in perfection, in completing the fattening of such neat cattle or sheep as have been brought considerably forward in the parcellies during the summer season. In this way there is much less loss infallinated than is generally the case where they are suffered to stand for spring feed, by the decay and deftruction of the outside leaves and other parts of the plants. In the feeding of milch-cows, at the same period, they may likewise be of very great utility, as supplying a large proportion of green food, whether the whole plant be made use of, or only the more loose green leaves, which may often be removed with-out much injury to the cabbages. In this method of application,
CABBAGE.

Cabbage, Turrip. See Brassica.

Cabbage, Dog's. See Theligenon Cynocrambe.

Cabbage, parsnip. In Agriculture, is a plant of the cabbage kind, in which the bulb or apple is of a roundish flat form, appearing principally above the surface of the ground, and as it were an enlargement of the stem of the plant, the leaves that surround it having much resemblance to those of broccoli. It has been occasionally cultivated under the title of cape cabbage, and often confounded, with the turnip-rooted cabbage, by those who have not sufficiently attended to the circumstances by which they are distinguished. It would seem to be the plant cultivated in different parts of Germany under the title of fablebrabi. The result of the trials made with it in field culture would seem to shew it a useful hardy plant.

The soils most adapted to the growth of this plant are those of the more light and dry kinds, that have some degree of elevation, with respect to situation, and which are in a good state of fertility from previous tillage. The land should be prepared, by ploughing three or four times, in nearly the same manner as for the common turnip; being laid up in the autumn, in order to be rendered fine and mellow. When thus prepared, at the time of planting, it should be ploughed into small two-bout ridges, and a suitable proportion of manure turned in. On the ridges, when flattened by a light roller, the plants are to be put in.

The same method should be pursued in providing the feed as has been advised for cabbages. In this culture it is sometimes sown in beds in the fields, whence the plants are afterwards to be drawn and set out; and in others, in drills or broad-cast, where the plants are to remain, being only thinned out to proper distances by the hoe. Dr. Dickson remarks, in his "Practical Agriculture," that "the frit method is probably, in general, to be preferred, though some cultivators contend that the plants succeed better, when not removed from the places in which they were deposited when sown, and which later experience in cultivating the common cabbage seems to show to be the case. Where the transplanting method is practised, the feed should be sown
fown sufficiently early to have the plants of a proper size, as about six or seven weeks growth at the time of transplanting. About the middle of March, or beginning of April, may be the most proper periods. The seed, in these cases, should be fown very thin, and the weak plants afterwards thinned out, till they are left at not less than three inches distance from each other. Five or six ounces of seed will, in general, be a proportion sufficient for affording plants for setting out an acre of ground. In the drill method, the same proportion of seed may also in common be sufficient, which should be put in the soil about the beginning or middle of April; but if fown later, as in May or June, it frequently succeeds. In the broadcast mode, from the plants not coming quickly to the hoe, the latter end of March may probably be the most proper period of sowing; the proportion of seed being somewhat increased.

The planting of these crops may be performed either upon the plain surface of the prepared ground, or after it has been thrown up into ridges in the manner first described; but the latter is by much the best method, especially where the land is inclined to moisture. The most eligible time for executing the buskins is, as in the common cabbage, when the land has had a good shower of rain, the operations of ploughing and set ting out the plants proceeding together; but Dr. Dickson observes, that "neither operation should be attempted when the ground is much soaked with rain, as much injury is not only done to the land, but the plants seldom thrive well."

In planting out, different distances are practised; some preferring the distance of two feet from row to row, and eighteen inches apart in the rows, where the soils are good; but in those of inferior quality not more than twelve; while others advise their being planted two and a half or three feet asunder, on two-bout ridges, the plants being placed as nearly as possible in the middle, immediately upon the dung, as recommended in the culture of the common cabbage.

The after culture in the crops must be performed in different ways, according to the methods of sowing or planting that have been practised. When the seed is put in by the hand, the crop can only be kept clean by means of the hand-hoe, which should be applied as frequently as is necessary for the purpose. But in the drill method, as well as where the crops are planted out with broad intervals and narrow distances in rows, it may be convenient to make use of both the plough or horse-hoe, and the hand-hoe, employing the former in flirling and clearing the intervals, and the latter in keeping the ground between the plants clean. When planted on ridges, it is recommended, that as soon as the plants have become firmly established in the soil, and weeds begin to appear, to throw a furrow from each side of them by means of a small plough that is narrow behind, flirling the parts not thus moved by the hand-hoe, and after the decay of the weeds these turned down, but before the plants get too large to return them to their former situation, care being taken, not to cover the hearts of the plants with the earth. These operations may be repeated as frequently as the state of the crop may require. But as this plant forms its bulb above the surface of the ground, the earth or mould should never be laid up so much to the roots of the plants as in the common cabbage, as it may not only prevent the swelling of the bulbs, but cause their destruction. It has been suggested in the work just noticed, that in dry seasons this plant may probably be cultivated with greater advantage than that of the turnip, as not being subject to the destructive attacks of the fly, and being less exposed to danger from other animals that are liable to destroy crops of that sort. When situated close to turnips that have been wholly devoured by the fly, it has never been perceived that plants of this kind were in the least touched by it. The bulbs or roots of these plants frequently attain a considerable size where the soils are good, the largest sometimes weighing eight or ten pounds, and are said to be much more hardy than the common turnip, though not so much so as the turnip-rooted cabbage. The quantity of produce on an acre is not probably in general equal to that of the common turnip, though it is very considerable.

The application of this sort of cabbage is chiefly in the feeding of neat cattle and sheep during the autumn or spring months, according as it may be fown more early or late; but the most profitable appropriation of it is probably in the latter season, as from the middle of March, till it is removed from the ground. In this way it may become an useful affidant to crops of the turnip kind. In which use, it possesses a particular advantage, in being formed, as it were, upon a footstalk above the surface of the earth, as it can on that account be more conveniently got at and removed during the time of frost, or when snow is upon the ground, than the common turnip. The proportion of nutritious matter contained in crops of this sort is considerable, and of a rich quality. Cows thrive extremely well on it when given in a proper manner. When fed off by sheep, the best method is that of bundling, in the manner practiced for common turnips. In this mode of application they are said to require little or no hay, even where the intention is to fatten the animals, as they make a greater progress on them than on any other sorts of food, except that of oats. Both cows and sheep have been found to feed upon the sprouts with avidity, after their having blossomed, and been cut and left to wither. But this practice should be cautiously practiced, as much injury must constantly be done to the land, by the plants being suffered to run to seed. When the bulbs are shrunk and withered from being cut and packed up in houghes, they are said to form a nutritious food for horses, but further trials are wanting to fully establish the fact. It is observed, in the "Annals of Agriculture," that instead of cutting off the bulbs below the parts where they are formed, in order to preserve them in houghes for the above purpose, it is the practice of some cultivators to plough them up whole, using a common plough, without any coulter, having only a round share with a blunt edge for the purpose. This is passed along under the rows, and performs the work with much ease, and in a very expeditious manner.

CABBAGE, turnip-rooted, in Botany. See Brassica.

CABBAGE, turnip-rooted, in Agriculture, a plant of the cabbage kind, which differs principally from the former, in forming its bulb, or protuberance, below the surface of the ground, in having it of an oblong shape, and in the leaves bearing a considerable resemblance to those of the common turnip. It has been introduced into field culture with advantage. The soils best suited to the growth of this sort of crops are those of the more friable loamy kinds, or such as have been formed by the gradual deposition of earthy matters from the overflows of large rivers, or the sea. But of whatever kind, the parts of them should have been well broken down and reduced by means of tillage, and not be too retentive of moisture. In preparing the ground, it should be brought into a considerable state of pulverization, or fineness, by repeated ploughings and harrowings; and enriched by the application of manures, in the proportion of eight or ten waggons load to the statute acre, which should be turned in with the last ploughing, in forming the one-bout ridges for receiving the plants. This is sometimes performed by the common plough; but it probably may be executed with more exact-
CABBAGE.

It is particularly necessary to attend to this last operation in dry seasons, as the success of the crop in a great measure depends upon it; and at the same time care should be taken that a greater number of plants be not drawn from the feed bed than can be planted out in the same day, and that they be as little as possible exposed to the action of the sun and wind. It is also necessary for a few days to guard against their being pulled up and destroyed by rooks, or other birds, which are apt to attack them.

The after culture of the crops must be carefully attended to in the east, as well as in other crops of a similar kind. In about ten days, or a fortnight, when the plants grow well, they will in general require the assistance of the hand-hoe, to clear the ridges and give the plants a flight dressing. And as soon afterwards as may be convenient, the intervals should be cleared either by the common plough, or any other more suitable implement, by passing them twice along each, turning the furrows, where the land is clear, and not too close or compact, up towards the rows, being careful not to earth up the plants to too great a height; but where the contrary is the case, he turned from them, so as to form a ridge in the middle of the interval, the implement being passed within a few inches of the plants in performing the operation. This ridge in dry seasons should be split down, and returned to the row again, in the course of a few days; another hand-hoeing being given as soon afterwards as may be found convenient. This last operation may frequently be unnecessary on the more light and clean descriptions of land; but on the strong and more compact soils it may be had recourse to with advantage, both in respect to the present and future crop.

The quantity of produce in crops of this kind, is frequently found, on good land, to be from 2° to 3° tons on the acre. It is stated, in the ninth volume of the Bath papers, that, in a practice of 20 years, the produce of an acre of this crop was, on an average, invariably found to be equal to the support of 5° sheep for a month, in the most hungry, trying, and difficult part of the year; and this on land then not worth more than 13°. an acre, but which contained between seven and eight thousand plants, averaging above four pounds each in weight. In the Transactions of the Society for the Encouragement of Arts, &c. various accounts are given of the great use of the produce of these crops, as well as of their vast utility as a late spring sheep feed. They have likewise been found beneficial in feeding milk cows, and hogs are very fond of them, fows giving abundance of milk while feeding on them. From this plant being a native of a more cold and northern climate, it of course retains, in some measure, the late habits of the situation from which it was originally brought, and becomes proper for the purpose of feeding live stock, at a later period in the spring, than many other plants to which it has a resemblance. It is seldom before the middle of April that the juice begins to rife, and the plant becomes proper for being fed upon. About this time, however, as is shown by the bulky appearance of its top, it begins to push forward, and be in a condition to be made use of. When employed before this period, it is laid, in the work just noticed, to be comparatively of little advantage; and, in some cases, even injurious to the animals that feed on and confume it. The principal application of crops of this kind is in the feeding of sheep, which are confined upon portions of them by hurdles, in the manner practised for the common turnip. The roots are, however, to be pulled up and prepared by being cut in two by means of an implement of the mattock kind, having a claw on one side nine inches long, with a transverse edge at its end, two inches in width, and on the other a fort of cleaver;
As to the origin of the cabbala, the Jews relate many marvellous tales. They derive the mysteries contained in it from Adam; and affir, that whilof the first man was in Paradise, the angel Raphael brought him a book from heaven, which contained the doctrines of heavenly wisdom; and that when Adam received this book, angels came down from heaven to learn its contents, but that he refused to admit them to the knowledge of sacred things, entwined to himself alone; that, after the fall, this book was taken back into heaven; that, after many prayers and tears, God restored it to Adam; and that it passed from Adam to Seth. The Jewish sages further relate, that the book being lost, and the mysteries contained in it almost forgotten, in the degenerate age preceding the flood, they were restored, by special revelation, to Abraham, who transmitted them to writing in the book "Jezi hour;" and that the revelation was renewed to Moses, who received a traditionary and mystical, as well as a written and preceptive, law from God. Accordingly, the Jews believe, that God gave to Moses on Mount Sinai, not only the law, but also the explanation of that law; and that Moses, after his coming down, retiring to his tent, rehearsed to Aaron both the one and the other. When he had done, Aaron standing on the right hand, his sons, Eleazar and Ithamar, were introduced to a second re- eal; this being over, the seventy elders that composed the sanhedrin were admitted; and finally, the people, as many as pleased; to all of whom Moses again repeated both the law and explanation, as he received them from God. So that Aaron heard it four times, his sons thrice, the elders twice, and the people once. Now, of the two things which Moses taught them, the laws and the explanation, only the first were committed to writing; which is what we have in Exodus, Leviticus, and Numbers: as to the second, or the explanation of those laws, they were contented to impress it well in their memory, to teach it their children; they to theirs, &c. Hence, the first part they call simply the law, or the written law; the second, the oral law, or cabbala. Such is the original notion of the cabbala.

The cabbala being again lost amidst the calamities of the Babylonish captivity, was once more revealed to Eldad; and it is said to have been preferred in Egypt, and transmitted to posterity through the hands of Simeon ben Setach, Elkanah, Akiba, Simeon ben Joachai, and others. The only warrantable inference from these accounts, which bear the obvious marks of fiction, is, that the cabbalistic doctrine contained early credit among the Jews as a part of their sacred tradition, and was transmitted, under this notion, by the Jews in Egypt to their brethren in Palestine. Under the sanction of ancient names, many fictitious writtings were produced, which greatly contributed to the spreading of this mythical system. Among these were "Sepher Habbalah," or the book of wonders; "Sepher Hakkahash," or the book of the pen; and "Sepher Habbalat," or the book of light. The first unfolds many doctrines laid to have been delivered by Elias to the rabbi Elkanah; the second contains mystical commentaries on the divine commands; and the third illustrates the most sublime mysteries. Among the profound doctors, who, besides the study of tradition, cultivated with great industry the cabbalistic philosophy, the most celebrated personages are the rabbi Akiba, who lived soon after the destruction of Jerusalem (See Akiba) and Simeon ben Joachai, who flourished in the second century (See Simeon ben Joachai). To the former is ascribed the book, entitled "Jezi hour," concerning the creation; and to the latter, the book "Solar," or brighter, and these are the principal sources, from which we derive our knowledge of the cabbala. From the third century to the tenth, few traces of the cabbalistic philosophy occur.
occur in the writings of the Jews. The probable reason is, that these mysteries, which differ materially from the ancient doctrine of the Jewish church, were entreatly only to the initiated, under a solemn oath of secrecy; and therefore few persons would venture to commit them to writing. Books that were written would be judiciously concealed from public inspection, and their enigmatical language would be a veil upon their meaning, which could not be broken by the vulgar hand of an uninstructed Jew. Besides, the Jews were for many centuries deeply involved in controversies concerning their traditional laws, and if they were posseffed of technical erudition, they thought themselves sufficiently learned: not to add, that the whole nation was oppressed and harassed by persecution.

That this system of the cabalistic philosophy, which we may consider as the esoteric, eretic, or concealed doctrine of the Jews, by way of contradistinction from the esoteric or popular doctrine, was not of Hebrew origin, we may conclude with a very great degree of probability, from the total dissimilarity of its abstruse and mysterious doctrines, to the simple principles of religion taught in the Mosaic law; and that it was borrowed from the Egyptian schools will sufficiently appear from a comparison of its tenets with those of the oriental and Alexandrian philosophy. (See Alexander.) Many writers have, indeed, imagined that they have found in the cabalistic dogmas, a near resemblance of the doctrines of Christianity, and have thought, that the fundamental principles of this mythical system were derived from divine revelation. This opinion, however, may be traced up to a prejudice which originated with the Jews, and passed from them to the Christian fathers, by which they were led to ascribe all pagan wisdom to an Hebrew origin; a notion which very probably took its rise in Egypt, when the Pagans first crept in among the Jews. Philo, Josephus, and other learned Jews, in order to flatter their own vanity, and that of their countrymen, industriously propagated this opinion; and the more learned fathers of the Christian church who entertained a high opinion of the Platonic philosophy, halfly adopted it, from an imagination that if they could trace back the most valuable doctrines of Paganism to a Hebrew origin, this could not fail to recommend the Jewish and Chaldaic religions to the attention of the Gentile philosophers. Many learned moderns, relying implicitly upon these authorities, have maintained the same opinion, and have thence been inclined to credit the report of the divine original of the Jewish cabala. But the opinion is unfounded; and the cabalistic system is essentially inconsistent with the pure doctrine of divine revelation. The true state of the case seems to be, that the Jews, like other oriental nations, from the most remote period, had secret doctrines or mysteries. During the prophetical ages, thofe, probably, consisted in a simple explanation of these divine truths, which the prophets delivered under the veil of enigmas. After this period, when the sects of the Essenes and Therapeutae were formed in Egypt, foreign tenets and inquisitions were borrowed from the Egyptians and Greeks, and, in the form of allegorical interpretations of the law, were admitted into the Jewish mysteries. These innovations chiefly consisted in certain dogmas concerning God and divine things, at this time received in the Egyptian schools, particularly at Alexandria, where the Platonic and Pythagorean doctrines on these subjects had been blended with the oriental philosophy. The Jewish tenets, thus enlarged by the accession of Pagan dogmas, were conveyed from Egypt to Palæstine, at the time when the Pharisees, who had been driven into Egypt under Hyrcanus, returned, with many other Jews, into their own country. From this time the cabalistic mysteries continued to be taught in the Jewish schools; but, at length, they were adulterated by a mixture of Peripatetic doctrines, and other tenets, which sprang up in the middle age. These mysteries were not, probably, reduced to any systematic forms in writing, till after the dispersion of the Jews, when, in consequence of their national calamities, they became apprehensive that those sacred treasures would be corrupted, or lost. In preceding periods, the cabalistic doctrines underwent various corruptions, particularly from the prevalence of the Aristotelian philosophy. The similitude or rather the coincidence, of the cabalistic, Alexandrian, and oriental philosophy, will be sufficiently evinced by briefly stating the common tenets in which these different systems agreed; they appear to follow: "All things are derived by emanation from one principle: and this principle is God. From him a substantial power immediately proceeds, which is the image of God, and the source of all subsequent emanations. This second principle sends forth, by the energy of emanation, other natures, which are more or less perfect, according to their different degrees of distance, in the scale of emanation, from the first source of existence, and which constitute different worlds or orders of being, all united to the eternal power from which they proceed. Matter is nothing more than the most remote effect of the emanative energy of the Deity. The material world receives its form from the immediate agency of powers far beneath the first source of being. Evil is the necessary effect of the imperfection of matter. Human souls are distant emanations from Deity, and after they are liberated from their material vehicles, will return, through various slates of purification, to the fountain whence they first proceeded." From this brief view it appears, that the cabalistic system, which is the offspring of the other two, is a fanatical kind of philosophy, originating in defect of judgment and eccentricity of imagination, and tending to produce a wild and pernicious enthusiasm. For a fuller account of the tenets of the Jewish cabbala, we refer to Brucker's Hist. of Philos. By Enfield. Vol. ii. chap. iii.

Dr. Burnet examines into the merits of the several parts of the cabbala, which he finds to be without rational foundation, and not conducing to any real knowledge. But he conjectures, that the most ancient cabbala, before it was confounded and defiled with fables, might contain something of the original of things, and their gradations; particularly, that, before the creation, all things had their being in God; that from him they flowed as emanations; that they will all flow back again into him, when they are destroyed; and that there will succeed other emanations and regenerations, and other destructions and absorptions to all eternity, as they had been from all eternity; that nothing is produced out of nothing; and that the things produced never return to nothing, but always have their sublimity in God. Burn. Arch. Philol. i. cap. 7. Phil. Trans. No. 201. p. 300.

Among the explications of the law, which, are furnisht by the cabbala, and which, in reality, are little else but the several interpretations and decisions of the Rabbins on the laws of Moses, some are mythical; confounding of old abstruse significations given to a word, or even to the letters whereof it is composed; whence, by different combinations, they draw meanings from Scripture, very different from those it seems naturally to import. The art of interpreting Scripture after this manner is called by the more particularly cabbala: and it is in this last sense the word is more ordinarily used among us. This cabbala, called also artificial cabbala (to distinguish it from the first kind, or simple tradition), is divided into three forts. The first, called gematria, consists in taking letters as figures, or arithmetical numbers, and explaining
explaning each word by the arithmetical value of the letters whereof it is composed; which is done various ways. The second is called {
iturtonian;} and consists either in taking each letter of a word for an entire division, or in making one entire division out of the initial letters of many. The third kind, called thururary, q. d. changing, consists in changing and transposing the letters of a word; which is done various ways.

The generality of Jews prefer the cabbala to the Scripture; comparing the former to the sparkling luftre of a precious stone, and the latter to the fainter glimmering of a candle.

The cabbala only differs from maforah, as the latter denotes the science of reading the Scripture, the former of interpreting it. Both are supposed to have been handed down from generation to generation by oral tradition only, till at length the readings were fixed by the scribes and accents, as the interpretations were by the maforah and gemara. Prideaux Comm. p. i. lib. v. p. 396.

The cabbala hitherto spoken of may be called speculative cabbala; in opposition to the following, which may be called practical cabbala.

CABBALA is also applied to the use, or rather abuse, which visionaries and enthusiasts make of Scripture, for discovering futurity, by the study and consideration of the combination of certain words, letters, and numbers, in the Sacred Writings. All the words, terms, magic figures, numbers, letters, charms, &c. used in the Jewish magic, as also in the hermetical science, are comprised under this species of cabbala, which professe to teach the art of curing diseases, and performing other wonders, by means of certain arrangements of sacred letters and words. But it is only the Christians that call it by this name, on account of the resemblance this art bears to the explanations of the Jewish cabbala: for the Jews never use the word cabbala in any such sense, but ever with the utmost respect and veneration. It is not, however, the magic of the Jews alone which we call cabbala, but the word is also used for any kind of magic.

CABBALIC art, Art cabalica, is used by some writers for art palestifex, or the art of wrestling.

CABBALISTIC art. See CABBALA, and CABBALISTS.

CABBALISTS, a sect among the Jews, who follow and practise the cabbala, or interpret Scripture according to the rules of the literal cabbala, above laid down.

The Jews are divided into two general sects; the Caraites, who refuse to receive either tradition, or the Talmud, or any thing but the pure text of Scripture; and the Rabbinists or Talmudists, who, besides this, receive the traditions of the ancients, and follow the Talmud.

These latter are again divided into two sects; pure Rabbinists, who explain the Scripture in its natural sense, by grammar, history, and tradition; and Cabbalists, who, to discover hidden mystical senses, which they suppose God to have concealed therein, make use of the cabbala, and the mystical rules and methods above mentioned.

There are visionaries among the Jews, who believe that Jesus Christ wrought his miracles by virtue of the mysteries of the cabbala. Some learned men are of opinion, that Pythagoras and Plato learned the cabalistical art of the Jews in Egypt; and fancy they see evident foot-steps thereof in their philosophy: others, on the contrary, say, it was the philosophy of Pythagoras and Plato that first furnished the Jews with their cabbala. Be this as it will, it is certain, that in the first ages of the church, most of the heretics gave into the vain notions of the cabbala; particularly the

CABBY, as an inhabitant of the cabbin, and to mark it. See CABBY.

CABBY or CABBEE, in Geography, lies N. of Holyhead island, on the coast of Wales, about two miles from the north point of that island.

CABE, a river of Spain, which uniting with the Velezor, runs into the Minho, a little to the west of Orense in Galica.

CABECA, or CABESS, in Commerce; the Portuguese who carry on the trade of fish in the East Indies, distinguish them by the names of cabea, and lavilla; that is to say, head and belly. The cabea fish is the finest; the lavilla being from fifteen to twenty, per cent, inferior to them. The Indian workmen endeavour to mix them together; for which reason the more experienced European merchants, who carry on that trade, take care to open the bales, and to examine the skins. The Dutch distinguish two sorts, viz. the ordinary cabbal, and the "caballa de mora."

CABECA de Vida, in Geography, a small town of Portugal, in the province of Alentejo, w. a strong castle. N. lat. 39°. W. long. 60° 43'.

CABECA, L.A. in Zoology, a snake of South America in Panama, there called the double-headed snake, from an imagination that it has a head at each extremity, and that from the bite of each it conveys a poison equal in activity to that of the coral or rattle-snake. Its usual length is said to be about half a yard, resembling in figure an earth-worm. Its diameter is about six or eight lines, and its head different from the heads of other snakes, being of the same dimensions with its body. The creature, however, has only one head, which, as it resembles a tail, has occasioned the notion that it has two heads. Its motion is very slow, and its colour variegated with spots of a paler tint.

CABEÇAS, Las, in Geography, a town of Spain, in the province of Andalucia, containing several ruins that indicate its having been formerly a large place; 4 leagues S. of Seville.

CABEÇAS Rubias, a town of Spain, in the country of Seville, on the confines of Portugal; 40 miles N. W. of Seville.

CABEÇAS, a town of Spain, in the province of Surial, 130 miles S. W. of Havanna.

CABEÇON, a town of Spain, in the province of Leon, seated on a mountain, with a fort on the river Pilunega; 3 leagues N.N.E. from Valladolid. Allo, a town of Spain, in the province of Aturmf; 18 miles W.S.W. of St. Andre.

CABEGO, a river of Portugal, which runs into the Lima, 7 miles above Ponte de Lima.

CABEL, or KABEL, ADRIAN VANDER, in Biography, a painter of landscape, sea-scene, and cattle, was born at Rywick, in 1657, and became a disciple of John Van Goyen, under whose instruction and example he made a rapid progress in his profession, and by whom his name was changed from Vander Touw to Vander Cabel. He copied nature and designed every object before he invented any in his compositions. His taste in designing animals and figures was formed after that of Calliglione; and in landscape his model was the style of Salvator Rosa. His manner is great, and much after the goûtt of the Italian school. The touchings of his trees are excellent; his figures and animals are very correct, and marked with spirit.
Although his different pictures have unequal merit, they are all distinguished by the freedom of his hand, and the incisiveness of his pencil. In his colouring he was licentious to imitate the Caracci and Mola; but the beauty of his design and composition is often injured by too dark and deep tone of colouring. His sketches, of which some few remain, are performed in a flight, free style. He died in 1695.

CABELLIO Canturion, Cavallion, in Ancient Geography, a town of Gallia Narbonensis. This was a Roman colony in the time of the triumvir Lepidus, 42 years before the Christian era. Wit's regard to the construction of the triumphal arch of Carollion it is conjectured, that as Pompey had granted the two banks of the Rhone to the inhabitants of Marseille, the town of Cavaillon, upon the Durance and near the Rhone, belonged to them. This monument was accordingly erected to commemorate the exploits of Pompey and the Roman armies. The medals of this city were bronze, gold, and silver.

CABEIIO port, in Geography, lies on the north coast of the Spanish main, in N. lat. 1° 31'. W. long. 67° 34'.

CABLEON, lies on the coast of Coromandel in India, 7 miles from Coromone N. by E. and 5 leagues from Madras or fort St. George. To the south of Cabelon are the 7 Pagodas, by which the town is known.

CABENDA, or Cabinda, a sea-port town of Africa, in the kingdom of Angoy or Gov on the coast of Luango, is situate on the mouth of the river of the same name, about 5 leagues N. of Cape Palmerino. The bay lies very commodious for trade, wooding, and watering on the sea-shore. Some parts of the adjacent ground are flat and marshy; but it gradually ascends about 3 miles within land and forms a ridge of hills, on the ascent of which is a town, where a flock of wood is always kept for the supply of foreign ships. The town of Cabenda is seated on the rounded point of the bay, looking towards the west, and the English factory on the south-west of the road, at some distance, N. E. from the town. The Portuguese, Dutch, and other Europeans come to this port for water and provisions. The houses, or rather huts, are built of dirt and reeds. The country round the bay is molly barren, and the people very lazy. They breed no cattle except some hogs, but they have plenty of poultry. The wild beasts are so numerous in the woods that they destroy all of the tame kind. Civet-cats and parrots are numerous. The coast abounds with oysters and the natives fish both on the beach and in the bay with drag-nets, having long canoes that are fixed at equal distances, instead of corks, to keep when any fish is caught. These nets are made of a peculiar root, which, being beaten, becomes flexible like hemp. S. lat. 6°. E. long. 12° 57'.

CABERASA, in Ancient Geography, a town of Asia, in Media, Ptolemy.

CABES, or Gases, in Geography, a town of Africa, in the kingdom of Tunis, situate on a river near a gulf of the same name. N. lat. 35° 40'. E. long. 10° 55'.

CABESA, a town of the island of Cuba; 55 miles N. of St. Jago.

CABESTA Gatta. See Cat's Head.

CABESTAN, or Cabaestang, William De, in Biography, a famous Provençal poet of the 13th century, mentioned by Petrarch, who passed the first years of his life in the castle of the lord of Cabatian; and being enamoured of a lady belonging to the house of Baux, wrote verses in her praise, which were popular. The lady, in order to secure his inviolable attachment, administered to him an herb by way of philtre, which deranged his understanding. He was rescued by an antidote, which converted his love into hatred. In his attendance on Tricline Carbonal, the wife of Raimond de Scalans, he ingratiated himself with her to such a degree as to excite the jealousy of her husband, who privately killed him and barbarously tore out his heart. This he caused to be dressed, and served up to his wife in a dish. After the had partaken of it, she was told what the bad eaten, and died of grief. This event occurred about the year 1215. Moren.

CABESTERRE, in Geography, a name given in the Antilles islands, to that part of the island which looks towards the sea, and which is always refreshed by the trade-winds, blowing from the north to the south-west. The opposite part is called "Baill-terra," being lower and less exposed to the wind, and of course hotter; here the sea is less agitated than in the Cabestreries, and it is consequently better adapted to the anchorage and loading of vessels.

CABESTERRE, or La Marjot, a town of the island of Guadeloupe on the east coast. N. lat. 16° 10'. W. long. 61° 44'.

CABESTES, lies near La Vera Cruz, on the S. W. coast of Campeachy bay in the gulf of Mexico.

CAZONE, a province of the kingdom of Angola in Africa, joining to Aca in the north, and to Lubalo on the south, and having the Coast on the south-east, and Kimbo on the south-west. It is populous, and well stored with cattle and other provisions; and it has a mine of iron on a mountain, called the "iron mountain," which supplies the Portuguese with great quantities of that metal, forged by the natives into a great variety of warlike and other useful implements. The inhabitants are plentifully furnished with water by the Rio Longo, and other smaller rivulets and lakes. Their trees are of a large size, and the bark being flaked with a knife yields an odoriferous resin, resembling wax in colour and consistence, and reckoned very medicinal. The avenue to the royal palace is decorated by a number of palm-trees that are very large and beautiful.

CABIAI, of Buffon, in Zoology, the thick-nosed Tapir of Pennant, the Sus Hydrocharis of Linnaeus, and Cavia Cabesiana of Pallis, &c., which see.

CABIDOS, in Commerce. See CAbidos.

CABIGAR, or Capexh, in Modern History, a tribe of Oriental Turks. Their origin is thus related. A female belonging to the army of Oghuz-Khan was delivered in the hollow of a tree to which she entered; and the infant was adopted by Oghuz, and called "Cabigiar" or the bark of wood, from the manner of his birth. In process of time his poverty became numerous and extended themselves to the north of the Caspian sea. They have retained the appellation of their ancestor, and their country is denominated in Perzia and in Turkish "Defekt Kipchakh." From this country proceeded the armies which first ravaged the dominions polstified in Persia by the Moguls; and they were the first troops which Babar and the first Sultan of the Turks opposed to Tamerlan; but instead of fighting against Tamerlan, they took a part with him and united with the Tartars, whom they regarded as their brethren of one and the same origin, D'Herbelot, Bib. Or.

CABILAH, a tribe of independent and vagabond Arabs, under the conduct of a chieftain. Some Arabian writers reckon 80 of these tribes, D'Herbelot.

CABILLAU, in Ichthyology, a name by which some authors have called the common cod-fish, the morhua and aequulus major of other writers.

CABILLEN, in Geography, a town of the duchy of Courland; 10 miles E. of Goldingen.

CABIN,
CAB

CABIN, or CABIN, is sometimes used for the huts or cottages of savages, and other poor people.

The habitations of the Indians in Virginia are cabins, about nine or ten feet high, which are made after this manner: they fix poles into the ground, and bring the tops of them one within another, and fix them together, the outside of these poles they line with bark, to defend them from the injuries of the weather, but they leave a hole in the top, right in the middle of the cabin, for the smoke to go out; round the outside of their cabins they have banks of earth cast up, which serve instead of doors and beds.

CABIN, a room or apartment in a ship, where any of the officers usually reside. There are many of these in a large ship; the principal of which is designed for the captain, or commander. In ships of the line, this chamber is furnished with an open gallery in the ship's stern, as also a little gallery on each quarter. The apartments in which the inferior officers or common sailors sleep and rest, are usually called births, which fine. The bed-places built up for the sailors at the ship's side in merchantmen, are also called cabins.

The word comes from the French cabine, Spanish cabana, or Italian cappanna, a little house but that from the Greek καμήνας, a stall or manger.

Cabin point, in Geography, a small port-town of America, in Surry County, Virginia, situated on Upper Chipook creek, 26 miles E.S.E. of Petersburg, 87 from Portsmouth, and 339 S.S.W. of Philadelphia.

CABINET, or CABINETS, the most retired place in the finest apartment of a building; set apart for writing, studying, or preferring any thing very precious.

A complete apartment consists of a hall, anti-chamber, chamber, and cabinet; with a gallery on one side.

CABINET is sometimes particularly used for a place at the end of a gallery, wherein are preserved the paintings of the best masters, conveniently ranged, and accompanied with bulbs, and figures of marble and bronze, with other curiosities. In this fene, cabinet amounts to the fame with what is called by Vitruvius, pomerotha. Sometimes there are several rooms defined for this use, which are all together called cabinet, or gallery.

CABINET also denotes a kind of buffet or chest of drawers, partly for the preservation of things of value, and partly as a decoration of a chamber, gallery, or other apartment. These cabinets are made of oak or of chestnut, of inlaid work or Japan, of ebony and of other rare wood.

In the repository of the Royal Society is a Chinese cabinet, filled with the instruments and implems used by the furgoners of that country. The most remarkable are those which are contrived for feratching, picking, and tickling the ears, in which the Chinese take great pleasure.

CABINET, in Gardening, is a little inflated building in manner of a summer-house, built in some agreeable form, and open on all sides; serving as a place of retirement, and to take the fresh air under cover.

According to Miller, a cabinet is a kind of faloon placed at the end or in the middle of a long arbour. It differs from an arbour, which is long, in form of a gallery, and arched over head; whereas the cabinet is either square, circular, or in cants, making a kind of faloon.

CABINET, in Natural History. This term is applied with some latitude to any small or select collection of natural curiosities, without regarding whether the articles it contains be contained within a cabinet or not. Thus, for instance, it is not unfrequent with us to speak of cabinets of animals, cabinets of birds, of fishes, reptiles, and other similar articles, as a mode of expressing such an assemblage of natural history as may not be of sufficient importance to deserve the epithet of a museum.

The word cabinet in its usual acceptation with the naturalist is not, therefore, confined solely to the boxes, presses, or chests of drawers, in which articles of curiosity are contained, but implies at once both the repository itself, and the articles arranged in it.

So much depends upon the fancy, taste, or judgment of the collector in the formation, or, as it is sometimes denominateed, building, cabinets for the reception of articles of this description, that no explicit directions can be given for this purpose with propriety. The most natural object to be considered is the compactness, of the drawers and chest, according to the size of the articles to be deposited in them, in order to compose as much as convenient, within the smallest compass in which they can lie without injury to each other, and at the same time be seen and examined with ease.

Cabinets of fossils, shells, and coral have the drawers sometimes divided for this purpose into small compartments, by means of an inner frame work, that lets into the bottom of the drawer; but trays of various sizes made either of card or palleboard have a much neater appearance, and are preferred by many as being more commodious, and more easily fitted from one part of the drawer to another, as the addition of new acquisitions in any particular tribe or genus may require. Nothing can be more desirable than to have the cabinets well made, that the drawers may slide with perfect ease in their proper receptacles in the press. The drawers should fit to close, when shut up, as to preclude the entrance of dust of any kind. The cabinet itself should be also placed in a dry situation, as there are few articles of natural history that are not affected in a greater or less degree by an excess of damp, or even heat.

The construction of an entomological cabinet depends less on the taste of the collector, in the present day, than the preceding, except so far as relates to the elegance or external embellishment of the cabinet, or the excellence of the workmanship. The drawers are uniformly made shallow, the bottom of each is lined with cork, and the top is covered with glass, through which the insect may be seen without being exposed to the air, or accidents that would arise from their being touched by the incautious spectator.

Cabinets of insects are built of various sizes, from those which contain ten or a dozen drawers to others that include above an hundred. They are usually of mahogany, but it is immaterial whether they be made of mahogany or walnut; some have them of cedar, but seldom of deal, or any other wood of a soft texture. The drawers may be from fifteen to thirty inches in length, the frame, or nearly the fame in breadth, and about two or three inches in depth. The cork with which the bottoms are lined must be chosen as free from cracks and holes as possible; it should be also glued into the drawers to prevent its warping, and be filed or cut very level; and after this the irregularities on the surface of the cork should be rubbed down with pumice-stone, till the whole is rendered perfectly smooth, before the paper is pasted over it. The paper should be of a fine smooth and even grain, but neither very flout, nor highly flattened with size, lest it should mar the points of the pins, when placing the insects in the drawers. The top of every drawer must be covered with a plate of glass, to prevent the admission of dust or air. This plate is usually fitted into a frame of the fame size as the drawer, and is made either to slide in a groove, or let in on a rabbot; the latter contrivance is much the best, because in sliding the glass along the groove, if any of the pins happen to stand high as to touch the frame-work.
the cork, with which the drawers are lined, should be well impregnated with a solution of corrosive sublimate mercury, in a fated saturated solution of crude ful-ammoniac in water. (an ounce of which will be sufficient to dissolve twenty scruples of the sublimate). This may be tried, since it has been strongly advised, although we believe the precaution needless. Mr. Druy adopted another plan: he pounded a quantity of crude verdigrise with common bees wax, and spread a thin layer of it between the bottom and the cork, in those drawers which were designed for the reception of his more delicate insects. We are, however, of opinion, that a solution of alum in water, washed either over the cork or paper of the drawer, would answer the same purpose, and be attended with less trouble. See article Entomology.

CABINET OF MEDALS. See Medals.

Cabinet is also used in speaking of the more select and secret councils of a prince or administration: thus we say, the secrets, the intrigues of a cabinet. To avoid the inconveniences of a numerous council, the policy of Italy and practice of France have introduced cabinet councils; a remedy worse than the disease. King Charles I. is charged with first establishing this usage in England. Besides his privy council, that prince erected a kind of cabinet council, or junto, under the denomination of a council of state; composed of archbishop Laud, the earl of Strafford, and lord Collington, with the secretaries of state. Yet some pretend to find the substance of a cabinet council of much greater antiquity, and even allowed by parliament, who anciently felt a quorum of persons most condol’d in, without whose presence no arduous matter was to be determined; giving them power to act without consulting the rest of the council. As long since as the 28th of Henry III. a charter passed in assent of the ancient rights of the kingdom; which provided that four great men, chosen by common consent, were to be conservators of the kingdom, among other things, should see to the disposal of moneys given by parliament, and appropriated to particular uses; and parlaments were to be summoned as they should advise. But even of these four, any two made a quorum; and generally the chief justices of England and chancellor were of the number of the conservators. Math. Par. 28 Henry III.

In the flirt of Hen. VI. the parliament provides, that the quorum for the privy council be six or four at least; and that in all weighty considerations, the dukes of Bedford and Gloucester, the king’s uncles, should be present; which seems to be erecting a cabinet by law.

CABIRA, afterwards called Diospolis, and since Schafopolis, in Ancient Geography, a town of Pontus, fourth-cast of Amasia, upon the river Iris. Mithridates built a palace in this city, where he had also a fish-pond, and in its vicinity parks for chase, and, according to Strabo, mines. This city became memorable for the defeat of Mithridates by Lucullus. When Pompey took possession of it, he gave it the name of "Diospolis," and the queen Pythodora, widow of Polemon, named king of Pontus by Antony, called it "Seballe," or "Schafopolis," i.e. the city of Augustus, in honour of that prince.

CABIRI, in Antiquity, certain deities worshipped more especially by the Samothracians, and in the Isle of Imbos, and some other parts of Greece. These Cabiri were originally Syrians or Phcenicians; and we are chiefly indebted to the fragment of Sanchonathen, recorded by Eusebius in his "Preparatori Evangelica," for the information, scanty and dubious as it is, which has been transmitted concerning them. From him we learn, that they were the sons of Sydyc, and the same with the Dioscures, Corybantes, and Samothracians; that they first disco-
vered the art of building ships; that from the time of Cronus (Saturn) their descendants navigated the sea on rafts or vessels of their own construction; and that they landed on mount Causses, where they consecrated a temple. It is also related, that Cronus gave the city of Berytus to Neptune and the Cabiri. Sanchoniathon further says, that these sons of Sydyc were eight in number; but he mentions only one of them by name, viz. Alexeius, who was surnamed Eufmus, from Ευφυς, signifying the eighth. He was the god of health, and ruler of life. Bochart supposes, that this Sydyc was Jupiter: Cumberland in his "Sanchoniatho's Phenician History," (p. 173, &c.) maintains, that he was Sem, the son of Noah; Shuckford supposes, (Connection, &c. vol. i. p. 213,) that he was Mizarim, the son of Ham, (Gen. x. 6,) or Menes, who settled in Egypt about the 15th year of Nimrod, A. M. 1772, according to him, or 2188 B. C. according to Blair's Tables. According to Panfalias (l. i. p. 751.) the original Cabirite divinity was Prometheus. The learned Bryant (Analyis of Anc. Myth. vol. ii. p. 460.) concurs with those who are of opinion, that Sydyc, or Sadie, was the patriarch Noah, and that the name by which he is called, or Sadie, corresponds to the character given of him in the book of Genesis, ch. vi. 9. He was Σαδίς, Sadie, a just man and perfect in his generation. All science, and every useful art were attributed to him; and through his sons they were transmitted to posterity. He supposes that the Cabiri were the family with the Curetes, Corybantes, Telamones, and the Idæi Dæthyli of Crete. However, in treating of them, great confusion has arisen from not considering that both the deity and priest were comprehended under the same title. Hence it has happened, that the appellation of Cabiri has been used by the ancients indifferently, to signify the gods in whose honour certain mysteries were instituted, the initiates of these mysteries, and the principal hierophants who officiated in them. From the account that has been already given from Sanchoniathon of the origin of the Cabirite deities, it is reasonable to imagine, that they were persons eminently distinguished for their exploits, and for the invention of arts useful to mankind; and that on this account they were deified by the Phenicians; and we may easily conceive, that the navigators who first passed from Phenicia into Greece introduced there the worship which they had rendered to the Cabiri, as the inventors of navigation. To this purpose Diódoros Siculus very justly observes, (lib. i. p. 144,) that the Greeks worshipped for their gods some heroes and great men, that had formerly been famous in Egypt, whole lives, or at least short memoirs of them, had been written at first in a plain and simple manner; but succeeding writers embellished the accounts given of them, by intermixing with them various fictitious Diodorus ascribes to the Cabiri the invention of fire, and the art of manufacturing iron. Hence it is, that on a medal of Gordian, and another of Firmus Simonis Trascullinus, both struck at Carthage, where the Cabiri were worshipped, we find the figure of a Cabirus on a column, holding a hammer in his right hand. For the fame reason, Herodotus (l. iii. ob. serves, they were represented like Vulcan. We need not wonder, if we consider the various useful arts that were ascribed to these deified personages, that they should be in general honoured. The Phenicians, Syrians, Egyptians, Greeks, Cypriots, Phrygians, Etruscans, Latins, Carthagians, and almost all the ancient Pagan, manifested the most profound veneration for the Cabirite mysteries. The name by which they are called denotes the high estimation in which they were held; for, instead of deriving it, as some have done, from the nymph Cabira, or from mount Cabirus in Phrygia, its etymology may more probably be sought in the Hebrew, or Phenician language, in which, the word "Cabir" denotes great and powerful; and, accordingly, they are described by Cassius Herminius (see Macrob. Sat. i. iii. c. 4. p. 376.) as "the great, beneficent, and powerful Gods." We have already observed, that the honours they received seem to have originated with the Phenicians, and by their navigators the worship of these deities was introduced into the island of Samothrace, where they landed before they passed over to the continent. At Memphis, in Egypt, they had a famous temple, which was held to be sacred, according to Herodotus, (l. iii. c. 27,) that no person, excepting the priests, was suffered to enter within its walls. In several cities of Syria the worship of these deities prevailed. At Cabira in Pontus, they had one of the most magnificent temples in the world. In Phrygia also, and Cilicia, there are evident traces of the same kind of worship. The Cabirite rites were also practised at Imbros and Lemnos; and they prevailed likewise in Greece, and particularly at Theba, in Bocotia: and as their chief province related to the sea and shipping, they were more especially imployed by mariners for success in their voyages. When the worship of the Cabiri was introduced from Phenicia, or Egypt, into Greece, it underwent various modifications and changes, as the Greeks were too proud to acknowledge themselves indebted, even for their superstition, to strangers. Accordingly, they altered the names of their gods, and disfigured their origin. By some of the Greek writers, they are represented as the sons of Jupiter and Caliope; by others, as the sons of Jupiter and Electra, or of Jupiter and Leda. Some refer Jupiter himself, and Bacchus, to the class of Cabiri; and others say they were the sons of the Sun and Minerva: others pretend that their mother was the nymph Cabira, the daughter of Proteus, and their father, Vulcan; and it is thought, that one of their sons is represented on the medals of Thessalonica, under the name of CABEIPOC, holding in one hand a hammer, such as Vulcan is represented with on the ancient monuments, and dressed, like him, with a cap on the head. The worship of Vulcan and his sons was established in Egypt, in the isles of Lemnos, and in other places, where they were honoured under the name of Cabiri, for having invented corn and the manufacture of it. As for particular names which the Greeks gave to the Cabiri, those which most frequently occur are Cablor and Pollux, the sons of Jupiter and Leda. Thefe Greek Gods were represented as Cabirian deities on some of the Greek medals of Marcus Aurelius and Lucius Verus. There were also known by the names of Iason and Dardanus, the sons of Jupiter and Electra; and also by those of Alcon and Erimoedon, the sons of Vulcan and Cabira, to whom is ascribed a son called Camillus, or Cudimillus, &c. Mercury. According to Ciceron, three others, called Trisapocerus, Eubuleus, and Dysnuvis, were the sons of Jupiter and Proserpine. Minucius, a Phenician author, has, according to Josephus, mentioned three others; viz. Axieros, said by some to be Ceres, and by others Jupiter; Axilocheria, or Proserpine; and Axiocheros, or Pluto. The nature of the mysteries of the Cabiri, and the rites of which they consisted, are not ascertained. They were disclosed only to the initiated, and penalties were annexed to the crime of divulging them. The mysteries of Ceres Cabiria in Bocotia were the same with those of the Cabiri in Samothrace; and it has been said by Clemens Alexandrinus, in speaking of the worship of these deities among the Etru-
enochrians, and others, celebrated them in the night, and, as it is related, with great indecency; and to this circumstance it is owing, that they have transmitted no written account of them to posterity. The "phallos" is said to have been one of their symbols in the Cabirian mysteries of Samothrace. M. de St. Croix in his "Memoirs concerning the sacred Religion of ancient Nations," (Paris, 1784), remarks, that the origin of the use of this symbol was as follows. Cadmus, the youngest of the Cabiri, having been killed by two of his brothers, who cut off his privities and flid to mount Olympus, where they buried them; this Cabir's death was commemorated by that symbol, and by many various expressions of grief on the part of the initiated. This author, combining the above relation of Herodotus with a passage in Pausanias, where the mysteries of the Cabiri are said to have been founded on a "precept that was made to them by Ceres," concludes, that this "precept," which Pausanias did not dare to specify, was no more than the obscure representation of the mutilated parts of Cadmus; and this, he adds, was the venerable object that was committed to the custody of the Vealans in after-time, as a sacred pledge of the safety of Rome, whether the Samothracian priests, who to a refuge in Italy, carried the religious rites and mysteries of the Cabiri. Whether this account be true or not, it is certain that the "phallos" was introduced under some form or name or another into the religious mysteries of ancient nations, and that the celebration of these mysteries was accompanied with many indecrous rites. Under the appellation of Cabiri, the ancients comprehended diversities of each sex, of all ages, of every rank and condition, civil, political, maritime, and infernal, to which they appropriated various attributes. To some of the Cabiri, who were the inventors of navigation, they ascribed the discovery of iron; to others, the origin of laws, letters, and writing; and to others again the discovery of various modes of incantation and magic, the medical use of plants, &c. &c. The worship that was paid to them in different places referred more directly or indirectly to those several attributes. Such was the estimation in which these deities were held in the remote ages of antiquity, and afterwards by the Greeks under various appellations, by which they were distinguished, that princes and personnages of rank referred to Samothrace in order to be initiated into their mysteries. Accordingly, we find that Cadmus, Orpheus, Hercules, Caifer and Pollux, Ulysse, and other heroes of the Trojan war, Philip the father of Alexander, and many others, made a voyage to this island, probably, under a notion that they might derive beneficence from the Cabirian deities in tempests and perilous voyages. Such was the veneration in which the Cabiri were held in the island of Samothrace, that it was thought an act of irreverence even to pronounce their names. Those who were admitted to the sacred ceremonies performed in honour of these deities used to afflict in a wood, which became a place of refuge for offenders, and was more respected than even the temple of Delphi or the island of Delos. To this island, Peres, king of Macedon, fled for refuge, and took up his habitation in a temple of Caesar and Pollux, hoping that the Romans would not profane a sanctuary revered by all the nations of the world; and, indeed, the Romans did not make any attempt upon his life or person so long as he continued there. Of all the oaths that were in use among the ancients, that by the Gods of Samothrace was deemed the most sacred and inviolable. Those who were found to have falsified this oath, were looked upon as the curse of mankind, and perjuries devoted to destruction. Of course, these mysteries were highly respected, and care was taken that they should not be revealed. With this view, the priests had a language peculiar to themselves, which was not understood by the people. The Corybantes were the ministers of these mysteries, not only at Lemnos and Imbros, but through the whole of Phrygia. For a more ample account of the various opinions of the fabulous ages, with regard to the names, origin, number, attributes, mysteries, and worship of the Cabiri, the reader, who is desirous of further information, may consult the writings of Clemens Alexandrinus, and Dechel. See Ceres, Eleusis, and Mysteries. See also Corybantes, Curetes, and Dioscuri.

CABIRI, in Ancient Geography, a people who inhabited the vicinity of mount Ida. Strabo says, that in his time, many supposed them to be the same with the Curetes. See CABIRI, supra.

CABIRIA, a surname of Ceres, who was the principal Cabirian deity: she had a sacred grove under this name in Boeotia.

CABIRIA, Ks^s^vms, religious feasts instituted in honour of the gods Cabiri. They were celebrated at first at Lemnos, afterwards adopted by the inhabitants of the islands of Samothrace and Imbros, and from thence passed into Greece to Athens, and particularly to Thebes, where they became famous.

These feasts were very ancient, and prior even to the time of Jupiter; who is said to have restored them: they were held by night. Children above a certain age were here consecrated: which consecration was supposed to be a preventive against all dangers of the sea, &c.

The ceremony of consecration called δευμετω, or δευμετωτ, q. d. enthronizing, consisted in placing the initiated youth on a throne, the priests dacing round him: the badges of the initiates were a purple girdle or scarf, and a crown of olive. When a person had committed any murder, the cabiria gave him an asylum.—Melethus is very particular in the proof of each of these points.

CABIRIDES, nympha, who were the daughters of Vulcan and Cabira.

CABIRUS, in Ancient Geography, a mountain of Asia Minor, in Phrygia.—Alio, a river of Asia, in the territory of the Suevi, at the mouth of which was good anchorage.

CABLE, in Navigation, a thick, long, three-strand rope, ordinarily of hemp, serving to hold ships firm at anchor, and to tow vessels in large rivers. In Europe, the cables are commonly made of hemp; in Africa, of long straw, or rushes called boja; and in Asia, of a peculiar kind of Indian grass.

The word cable comes from the Hebrew word chevel, cord. Du-Cange derives it from the Arabic, balb, cord, or barata, vincere: Menage, from caputum, or capabulum; and that from the Greek κατσαρον, or the Latin canesus.

The term cable is sometimes also applied to the cordage used to raise heavy loads, by means of cranes, wheels, and other like engines: though in strictness, cable is not to be applied to ropes of less than three inches in circumference. Every cable, of whatsoever thickness be it, is composed of three strands; each strand of three twines; and each twist of a certain number of cuborns, or threads of rope yarn, more or less, as the cable is to be thicker or smaller.

Every merchant-veffel, how small soever, has three cables; viz. the main or master-cable, which is that of the chief anchor,
anchor, called the fleet-cable; and the two bowers, beat and small. The ordinary length of the great cable is 120 fathoms or braces.

To make a cable: after forming the strands, they use flaves: which they first pass between the strands that they may turn the better, and be interwoven the more regularly together. And to prevent any entangling, a weight is hung at the end of each strand. The cable, being properly twisted, neither too much, so as to become stiff, nor too little, so as to be weakened, is untwisted again three or four turns, that the rope may the better retain its shape. The usual allowance for the diminution of length by twining, is one-third of the whole; so that for a cable of 120 fathoms, the rope-yarn shall be 180 fathoms long.

The number of threads which each kind of cable is to be composed of, is always proportioned to its length and thickness; and it is by this number of threads that its weight and value are ascertained. Supposing then, the lengths to be equal, the number of threads and the weights will be as the areas of their bases, or, which comes to the same, as the squares of their circumferences. Having then the weight and number of threads of any one cable, we may easily calculate the following table. (See Aubin's Marine Dictionary.)

Several statutory laws respecting the manufacture of cables have been made in the reign of his present majesty, G. o. III. See 26 Geo. III. c. 56. It has also been enacted, that commanders of vessels belonging to British subjects, having on board foreign made cordage, shall make entry thereof at their arrival into any British port; and that no one, making default herein, all such foreign cordage shall be on board shall be forfeited to his majesty; and that for every such offence, forfeit the sum of 20s. for every hundred weight thereof.

In the French marine, the circumference of the largest cable is one twenty-fourth part of the extreme breadth of the ship; or half the breadth in feet will be the circumference in inches. Thus, the circumference of the largest cable of a ship, whose extreme breadth is 52 feet, will be 16 inches. The length of a cable is 120 fathoms, each 5 French feet. The weight of one fathom of cable in French pounds is nearly equal to one-tenth of twice the square of the circumference; and, consequently, the weight of the whole cable will be nearly equal to twenty-four times the square of the circumference. The weight of an anchor is half the weight of the cable to which it belongs.

**Cable, lit the.** See Bits.

**Cables, Bower,** those belonging to the beat and small bower anchors, and are named accordingly.

**Cable, clinch a,** is to run it through the hawse-hole and the ring of the anchor, three or four fathoms in length; then haul the bight up in the head, and pass the end of the cable over the bight, and through the ring, between it and its own part; then pass the cable bends, and crotch them with strands, well grounded, one at the end, and the other about one foot from the end; and be careful not to form the clinch larger than the ring of the anchor.

**Cable, coil the,** to make it up in a circular or elliptical form, for the convenience of flowing it; each complete round or turn of the cable is called a fake, and one range of fakes along-side of each other is called a tier. There are generally from five to seven fakes in a tier, and three or four tiers in the whole length of a cable; but this depends on the length of a fake, and the number contained in a tier. Several authors, and particularly Melch. Hutchinson and Gower, have recommended that all cables should be coiled the same way they bit, or the way they run round the windlass, and their tiers should be on the side opposite to that on which they lead. The beat bower, which is in general the working cable, should lead foremost up the hatchway, then the small bower, and, after all, the sheet, which being the least wanted, can be made up snug round the fore part of the hatchway, out of the way. Should new cables come immediately from the rope-walk, let them be coiled down into the craft that is to bring them on board the same way they are to be coiled on board. A cable generally kinks from more turns being forced into it by the coiling than it naturally had; the kinks may, however, be avoided, either by coiling the cable against the fun, or with the fun, and the end taken through the coil, and the cable coiled down in the tier the way required. It should be a rule, in coiling cables, never to lay out near the hatchway, but to keep that part of the tier as low as possible, that the bends may have sufficient room to unspirt. Were all cables first coiled down from the rope-walk against the fun, they would be better adapted to coil on either side of a ship, for a cable coiled against the fun will more easily reversé, and have less kinks in it than a cable coiled with the fun.

**Cable, cut the.** When a ship is riding at anchor in an open bay or road-head in a gale of wind, it many times becomes necessary, for the preservation of the ship and crew, to cut the cable with a hatchet at the hawse holes or at the bits, when it cannot be purchased, and stand out to sea, under any convenient sail that it may be possible to set. This may be also necessary when compelled to fly from or pursue an enemy. If a ship parted her cable, the insurance would be lost. See Slip the Cable.

**Cable, elastic.** See Coir.

**Cable-laid,** any rope laid in the same manner as a cable.

**Cable's length,** is 120 fathoms, each 6 feet. The distance between two adjacent ships of war, when formed into the line of battle, is appointed to be one or more cables' length, according to circumstances. The method of keeping the ship in its proper position with respect to the one next a head, is to calculate the angle which the whole or any particular portion of the main-mast of that ship would subtend at the proposed distance. Then, if the angle observed by a quadrant is the same as that by calculation, the ship is in her proper station; if greater, she is too far a-head, and therefore some fault must be taken in; but if less, the ship is too far astern, and more fault must be set in order to regain her station. If the main top-gallant truck be brought to coincide with a mark, the same height above the water as the observer, this angle is found as follows: from the logarithm of
of the given height, its index being increased by 10, subtract the logarithm of the elevated distance, the remainder will be the log. tangent of the required angle. But if there is no fixed mark, and in that case, the angle subtended by the distance between the truck and the water to be observed, the measurement of this angle may be found by calculation as follows: from the height of the truck above the water subtract the height of the observer; from the log. of the remainder, its index being increased by 10, subtract the log. of the difference; the remainder will be the log. tangent of an arch; and from the log. of the height of the observer, its index increased by 10, subtract that of the difference; the remainder will be the log. tangent of an arch; the sum of these two arches will be the angle required.

Example. Let the elevated distance between two adjacent ships be one cable's length, or 720 feet, the height of main-top-gallant trucks 680 feet above the water 100 feet, and the height of the observer's eye 24 feet; required the angle subtended by the mark?

See also Dr. Mackay's Navigation, p. 224.

Cable, link wearing of a, is an operation performed for preserving it in rocky and stony ground, or defending it against ice. For this purpose chains are tied round cables in the following manner. Take three chains, each about 15 fathoms in length, and all of an equal size, and in thickness proportioned to the purpose to which they are adapted. Let these be wound round the cable, so that they may project sufficiently to fill the greatest part of the friction, one end of them being fastened to the ring of the anchor, and each chain being from thence wormed round its respective hollow or channel of the cable, so as not to prevent its stretching. Fatten the other ends of the chain to the cable. The chains need not be very heavy; but the links should be short, because they will thus be more pliant, and worn more easily. These chains will effectually guard the cable against the chafing of the rocks, and they may be put on in a few minutes, so that it is not necessary to have them fitted on but when they are likely to be serviceable. As the weight of the three chains, even for a large cable, will not exceed 500 pounds, the only remaining difficulty is that which arises from the smallness of the hawse-holes; in order to obviate this, the holes may be enlarged; and with the additional aid of a boy or spare man at the head of the cable, to call off the chains as they come up, and hand them in above, every inconvenience will be removed. But if it should require a few minutes more to weigh an anchor so secured than a common one, this can be no argument against a measure that tends to preserve and ensure the safety of the vessel and of the ship's company. In high latitudes, where ice may cut or damage the cables, while riding at anchor, the use of three other chains such as the preceding, but not more than five or six fathoms in length, may be recommended. These may be wormed round the cables in the same manner at the surface of the water, and will be an excellent means of guarding them from the pressure of the ice, so as to prevent its either wounding them or chafing them quite afunder.
CABLING, in Architecture, the figure of a flatt, or reed, either plain or carved, in resemblance of a rope, or a rush, wherewith a third part of the flattings of a column are sometimes filled up; hence called cablurings.

There are also cablings in relievo without flattings, especially on certain pilasters, as in the church of Sapienza at Rome. See FLUTES.

CABLISH, Cablicia, in the Forrest Law, denotes brush, or bowrose wood; though Seldman takes it more properly to signify trees, or branches, thrown down by the wind; from the French cablis, or bois cablis, which denotes the same.

CADO, in Geography, a kingdom of Africa, in Nigeri, situate to the south of the Rio Grande, and near the sources of the Cansamanka, about 150 leagues from its mouth. Little is known concerning it; but some voyagers affirm that the king is rich and powerful, and that in time of peace he keeps 7000 men well armed, in order to command due respect from his neighbours.

Cabo Cofo, or Cape Cofo, a cape and factory of Africa, on the Gold coast. N. lat. 5° 16'. W. long. 2° 30'.

Cabo de Cruz, a bold point of land on the south side of the island of Cuba. N. lat. 19° 57'. W. long. 78° 28'.

Cabo de St. Juan, the north-easternmost point of the island of Porto Rico. N. lat. 18° 30'.

CABOCHED, Cabroshed, or Cabosshed, formed from the obsolete French caboches, from caput, head, in heraldry, is where the head of a beast is cut off behind the ears, by a section parallel to the face; or by a perpendicular section, in contradistinction to capped, which is done by a horizontal line; besides that it is farther from the ears than caboring. The head in this case is placed full-faced, or affrontee, so that no part of the neck is visible. This bearing is by some called Trunked.

CABOCHON, in Gemology, the name given by Argenville to the Italian Patella equus; which see.

CABOCLIES, in Modern History, a name given in the Well Indies by the Portuguese to those produced between America and Negroes.

CABOLITE, in Ancient Geography, a people of Asia, placed by Ptolemy in Parapamisus.

CABOMBA, in Botany. See NECTUS.

CABOT, Sebastian, in Biography, an eminent navigator, the son of a Venetian pilot distinguished by his skill in the same art, and often resident in England, was born at Bristol about the year 1477, and instructed by his father in those branches of mathematical science which were necessary for forming a skillful marman. Before he had attained the age of 17 years, he made many trips to sea; thus gaining an acquaintance with the practical part of navigation to the knowledge of its theory. In his first voyage of any importance, he accompanied his father for the discovery of unknown lands, and particularly for exploring a north-west passage to the East Indies. John Cabot, encouraged in this attempt by the discoveries of Columbus, who returned from his first expedition in 1493, obtained, in 1495, letters patent from king Henry VII. empowering him and his three sons to discover, conquer, and settle lands then unknown, in recompense of which they were to be invested with many privileges. The king, however, referred to himself one-fifth part of the next profits, and refrained them to return from their voyage into the port of Bristol. Accordingly in the following year he prepared for his expedition, and

obtained the king's permission to undertake six ships of 200 tons burden and under, in any harbour of the realm, and to engage a sufficient number of mariners. His majesty was at the expense of fitting one ship at Bristol, and the merchants of that city and of London added three or four small vessels, freighted with marketable commodities. With this fleet John Cabot and his son Sebastian set sail in the Spring of 1497, and proceeded till the 23d of June, when they discovered the island of "Baccalao," so called from the fish which they found in great abundance on its coast, but now known by the name of Newfoundland. Another adjoining island they called St. John, probably from the Saint's day on which it was discovered. On this island, as they supposed it to be, which was the south-west part of Newfoundland, they found inhabitants who were clothed with the skins of beasts, and who used bows, arrows, pikes, darts, wooden clubs, and flings. Three of these natives were brought with them to England. It is supposed, however, that Sebastian had made some voyages of discovery in the reign of Henry VII., without his father; and that in some of these he failed, as far north as 67° and a half, and was prevented from proceeding further by the mutiny of his crew. After the discovery of Newfoundland, Cabot and his son failed down to Cape Florida; and on their return to England they were well received, as they were the first navigators who had actually seen the continent of America; Columbus not having observed it till the following year. During the succeeding period of 20 years, there is a chasm in the history of Sebastian's transactions; nor is it certain when or where his father died, though he probably terminated his life in England, to which he appears to have been much attached. In the 8th year of the reign of king Henry VIII. we find that Sebastian Cabot had formed an intimate connection with Sir Thomas Per, then vice-admiral of England; and that he had obtained, by his interest with the king, a good ship for the purpose of prosecuting his discoveries. It seems to have been at this time his intention to have sailed by the south to the East Indies, and with this view he sailed first to Brazil; but disappointed in his purpose through the timidity of his coadjutor, Sir Thomas Per, as Hakluyt affirms, he directed his course to the islands of Hispaniola and Porto Rico, and having trafficked here for some time, he returned to England. Thus disappointed in his views, he left England and removed to Spain, where he was very respectfully received and appointed pilot-major, for the purpose of reviewing all projects of discovery, which were, at that period, numerous and important. In the year 1524, many opulent merchants entered into a treaty with him, and engaged to defray the charges of an expedition to the Moluccas, or Spice Islands, by the new-found passage of Magellan. Accordingly he set sail from Cadiz with four ships, in April 1525; and proceeded first to the Canaries, then to the Cape Verd islands, and afterwards to Cape St. Augustine, and to the island of Pato, or Geete. At the bay of All Saints he was liberally supplied with provisions, for which he made a very ungrateful return by forcibly carrying away four of the principal persons of the island. He then proceeded to the river La Plata, and landed on a desert island Martin Mendoza, his vice-admiral, Captain Francis de Rojas, and Michael de Rojas, where he left them because they had ventured his conduct. Being prevented by a mutiny among his men and by scarcity of provisions from prosecuting his voyage to the Spice Islands, he failed about 30 leagues up the river La Plata, and found an island which he called St. Gabriel, about a league in compass and half a league from the continent towards Brazil; and having discovered about three
three leagues higher a river which he named St. Salvador, and which, being very deep, afforded a good harbour, he brought up his vessels and unloaded them. Here he built a fort, and advancing with boats 30 leagues higher, he found another river, called Zarcarama, and constructed on the banks of it, as the inhabitants were intelligent and not unfriendly, another fort, called by himself Santi Spiritus, or of the Holy Gholl, and by his followers Cabo de fort. He afterwards discovered the shores of the river Parana, with several islands and rivers, and at length arrived at the river Paraguay, where he found people tilling the ground; a circumstance which had not before occurred to him in that part of the world. In a conflict with the Indians, by whom he was opposed, he killed many of them, but 27 of his own men were slain, and three taken prisoners. During this winter he fell in with James Garcia, who had been dispatched from Galicia for the purpose of making discoveries, and having returned together to the fort of the Holy Gholl, they sent messengers to Spain. The two persons that were deputed by Cabot gave a very favourable account of the countries adjoining to the river La Plata which he had subdued, and produced gold, silver, and other valuable commodities, as testimonials to their commander's good conduct. At the same time they demanded a supply of provisions and ammunition, as well as other articles adapted to the purposes of commerce, together with a recruit of seamen and soldiers. The merchants, however, who had fitted out Cabot's squadron, were unwilling to comply with these requisitions, and chose to surrender their rights to the crown of Castile. But the king delayed the necessary preparations so long, that Cabot, who had been five years employed in this expedition, and who was tired with waiting for necessary supplies, determined to return home. Accordingly he embarked his men and effects on board the largest of his ships, leaving the rest behind him; and arrived at the Spanish court in the spring of the year 1531. In the mean while prejudices had been excited against him, on account of the rigour with which he had treated the Spanish mutineers, and because he had not proceeded to the Moluccas, so that his reception was not favourable. However, he retained his place, and continued in the service of Spain for many years; till at length, for reasons with which we are not acquainted, he resolved to return to England. This took place towards the latter end of the reign of Henry VIII. at which time he resided at BristOL. In the commencement of the following reign he was introduced into the protector, lord Somerlet, and by him to king Edward VI. who took great pleasure in his conversation, and granted him, in 1549, a pension of 16,135. 4d. a year; an annuity which was allowed him, according to Hakluyt, as grand pilot of England. From this time he was highly favoured by the king, and consulted upon all commercial matters. In May 1552, the king granted a licence, together with letters of safe conduct, to such persons as were willing to embark on board three ships, destined for exploring a passage by the north to the East Indies. The enterprise was undertaken by the advice and recommendation of Cabot, then governor of the company of Merchant-venturers; and he furnished necessary directions, which evinced both his wisdom and integrity. For his trouble and charge in this business, his Majesty presented him with a gratuity of 200l. This expedition was entrusted to the command of Sir Hugh Willoughby, and it produced the discovery of the important trade to Archangel, which fee. Cabot was also appointed by royal charter governor for life of the Russia company, in whose concern he took a very active part; and in 1555 letters patent were granted by which their Majesties, Philip and Mary, granted him an annuity of 160L 13s. 4d. during his life. In April 1556, he appears to have retained the habitual arbour of his mind for the prosecution of discoveries; for he visited Mr. Burroughs at Gravesend on board his small vessel designed for Russia, and gave a liberal entertainment to the sailors on this occasion. This is the last circumstance that is recorded concerning him; and he is supposed to have died in the following year, when he had probably attained the age of nearly 80 years. He was a skillful navigator, and possessed in his time a very high reputation. To his capacity, integrity, and zeal, tacky was very much indebted. The variation of the compass was first observed by him. See Variation. Cabot published a large map, which was engraved by Clement Adams, and hung up in the privy gallery at Whitehall; and on this map was inscribed a Latin account of the discovery of Newfoundland. He also published a work entitled "Navigations delle Parte Settecentionali," printed at Venice in 1563, fol., and his instructions above referred to were printed in Hakluyt's voyages. Biog. Brit.

CABOT, in Geography, a township of America, in the county of Calcasie and state of Vermont, situate on the height of land between lake Champlain and Connecticut river, about 17 miles from the 13 miles falls in this river, and containing 1202 inhabitants.

CABOT, in Ichthyology. Sec Corax.

CABOURG, in Geography, a town of France, in the department of Calvados, and district of Caen, ten miles N. of it.

CABRA, a town of Spain in Andalusia, situate at the foot of a mountain, near the source of a river of the same name, containing besides a church and six convents, a college for the study of philosophy and divinity; 25 miles S.E. of Cordova.

Cabra, an inconsiderable town of Portugal, in the province of Beira; 20 miles E.S.E. of Viseu.

Cabra, or Karr, a town of Africa in the kingdom of Tombuctoo, situate on the river Guin, or Neel Abreed, west of the islands Timala or Gambia, and about 12 miles S. of Tombuctoo, of which it is the port. It is a large town without walls and a place of great trade. The inhabitants are said to be subject to sickes that are attributed to the heterogeneous qualities of their food, which is usually a farrago of milk, fish, fish, butter, oil, and wine. Here resides a judge, who is appointed by the king for deciding all controversies. N. lat. 16° 24'. E. long. 1° 30'.

CABRAL, or CARRERA, Pedro Alvarez, in Biography, a Portuguese navigator, who commanded the second fleet fitted out in 1500 for the East Indies by Emanuel, king of Portugal. Axious to avoid the coast of Africa in the course of his voyage, he fled out far to sea, and after a month's fasting, was driven by a tempest on the shore of an unknown country, which proved to be that part of South America, now called Brafil. Having landed at Santa Cruz on the 24th of April, 1500, he took possession of the whole country for the crown of Portugal. (See Brasil.) From this new coast he proceeded to Solia in Africa, whither he arrived after having lost six of his thirteen ships; and from thence he failed to Calicut, where he obtained leave of the sovereign, or zamorin, to form a commercial establishment. Some time after there occurred a jealousy between him and the inhabitants, which produced hostilities, in the course of which Cabral burnt several ships in the port, and battered the town, so that the zamorin was at length obliged to acquiesce in the terms that were proposed. He afterwards went to Cananor, where he made a treaty with the prince; and in 1501 he returned to Portugal with a rich cargo. He published an account of this voyage, printed in an Italian translation by Ramuio at Venice. Having gained reputa-
tion by his discoveries and exploits, he died in his own country. Nouv. Dict. Hist.

CABRAT, in Geography, a town of Spain, in the territory of Cordova; 3 miles N.W. of Lucena.

CABRE, a town of the island of Cuba; 30 miles S. of Spiritu Santo.

CABRELLA, a town of Portugal, in the province of Ellemadura; 1/2 leagues E.S.E. of Setubal.

CABRERA, lat. Caparvia, a small island in the Mediterranean, deriving its name from the number of goats upon it. It is mountainous and desert; no part being inhabited except its port, which is large and safe, and the entrance of which, opposite to Majorca, is defended by a castle and a small garrison. Under the west end of the island there is a good road. Criminals are banished into this island; 2 1/2 leagues S. from Majorca.—Alfo, a small island near the north coast of the island of Sardinia, lat. 41° 15'. E. long. 9° 27'.—Alfo, another island, named likewise Caprara, lying about E.N.E. from Cape Corse, on the north point of Corica, nearly N. from the west end of the Elbe Island. — Alfo, another island E. of the island Sapienza, at the S.W. point of the More.—Alfo, another island in the gulf of Venice, not far from the coast of Italy, and nearly north from mount St. Angelo, or the gulf of Varennes.

CABRERA island, lies on the south coast of Candia island, S. of the Archipelago islands, about twelve leagues E.N.E. from the island of Goza. On the exit of it is a fair bay, in which is a good road; and another to the west.

CABRERES, a town of France, in the department of the Loi, and district of Cahors; 13 miles E.N.E. of it.

CARES, Illes de, or Goat island, a small island belonging to Africa, near the coast of Guinea, at a small distance from the island of St. Thomas. It is mountainous and covered with lemon-trees.

CABRETA, cape, lies on the coast of Spain, 5 leagues E. from the island Tariffs, and the westernmost point of the great bay of Gibraltar.

CABRIEL, a river of Spain which runs into the Xucar, from after it enters Valencia.

CABRIERES, a town of France, in the county of Venaissin; the inhabitants of which were ordered to be massacred by an arrêt of parliament in 1545, under the pretext of religion; 3 leagues N. of Cavaillon.

CABRILLA, in Ichthyology, a species of Perca, found in the Mediterranean sea, the body of which is marked with four longitudinal fangious bands. Linn. Misc. Ad. Fr.

CABRITA island, in Geography, See CAPREA.

CABROL, Bartholomew, in Biography, a native of Languedoc, received his education in anatomy and surgery, at Montpellier. Returning to his own country, in 1555, he was appointed surgeon to the hospital of St. Andrew, in that city. In 1570 he was invited by the University of Montpellier to take the office of demonstrator in anatomy; an office he filled with credit several years. In 1594 he published an anatomical treatise, under the title of "Alphabet Anatomique," at Tournon, 4to. reprinted at Geneva in 1602, and afterwards translated into Latin, with the title of "Alphabeton Anatomicum," id el., "Anatomes Elenchus accuratissimus, omnes humani corporis partes, ca qua facern solent methodo delineans, accesserent ontologiae, observationeque medicis ac chirurgis perutilis, 1604, Geneva." In this form it has been frequently reprinted; and is valuable, Haller says, for the number of curious and useful observations contained in it. It is inserted in a collection of treatises, entitled, "Collegium Anatomicum clarissimum trium viro- rum, Jaffolini, Severini et Cabrolii. Douglas Bibliog. Haller, Bib. Chir. Eloy. Dict. Hitt.

CABRON, cape, in Geography, the north-eafl point of Prelique ille de Samana, in the island of St. Domingo, 22 leagues S.E. by E. from old cape Francois. N. lat. 19° 33'. W. long. 68° 40'.

CABRUSI, in the Writings of the Ancients, a word frequently used to express Cyprinus, or coming from the island of Cyprus. The ancient Greeks had almost all their vitriols and vitriolic minerals from this island; they therefore sometimes called thesè cabrusi, without any addition. It is very probable that our word copperas, the common name of green vitriol, is a false pronunciation of this word cabrusi.

CABULIA, a West Indian species of hemp, produced in the province of Panama, from a plant somewhat like the chardon or iris; when ripe, they lay it to steep in water, and after drying it again, beat it with wooden mallets till nothing but the hemp remains, which they afterwards spin, and make thread and ropes of it; the former of which is so hard and tough, that with it they saw iron, by fitting it on a box, and laying a little fine sand over the metal as the work proceeds.

CABUL, CABULISTAN, or ZABULISTAN, in Geography, a country of Asia, on the limits of Hindostan, and west of the Indus, which was formerly a province of Perlia, afterwards annexed to the Mogul empire, and comprehended again under the Persian monarchy in 1759, by Nadir Shah. It is bounded on the north by Kuttore or Caferrlan, and the Hindoo-Kho mountains, which latter separate Cabul from Balk and Badakhshan; on the west by the fame mountains and Candahar, on the south by Moulton and Lahore, and on the call by Cafhmere. This Soubah, under the Mogul emperors, comprehended the whole space between the Indus and the mountains of Hindoo-Kho, being in dimensions 150 coffes (each cofe being about 176 iturate mile,) according to the Ayin Aebabere; and this is its greatest extent; for 100 coffes are given for its breadth between Kurrabagh, situate 11 royal coifes S.W. of Ghizni, and Chuganferei at the western extremity of Caferrlan. Cabul is confined on the north by the continuation of Hindoo-Kho, and on the north-east by Caferrlan. Towards the south, or the quarter of Bungroh, its extent is not ascertained; but as its greatest breadth is included within the space between Kurrabagh and Chuganferei, we may conclude that it cannot extend far beyond the river of Nughz. We have a more ample description of Cabul in the Ayin Aebabere; from which, as well as from every other account, it appears to be a country much diversified by mountains covered with eternal snow, hills of a moderate height and easy ascent; rich plains and flatly forested; and these enlivened by innumerable streams of water. It produces every article necessary to human life, together with the most delicate fruits and flowers. In the Ayin Aebabere Cabul is reckoned a part of the fowah of Cafhmere; but it has been since, with great propriety, regarded as a fowah of itself. Cabul, with respect to its natural geography, is divided into two parts, separated by a ridge of very high mountains, usually covered with snow, which runs from west to east from the neighbourhood of Ghizni to that of Deenkyte on the Indus, below Attok. The tract lying to the north of this ridge is named Lumphar, or the Lumphanah; and that on the south Bunga-hor, or the Bungothat; each having one or more considerable rivers interjecting their whole length, and discharging themselves into the Indus. Each tract has also its proper roads, and its pails over the Indus, from the districts of Cabul, Candahar, and Ghizni, respectively; but the northern, or Lumphanah road, is that in common use, either to Peria or to Samarcand, notwithstanding its circuitous nature, as it respects the former of these countries; for it is both the easiest and the safest.

Cabul, as well as Candahar, together with some districts 4 N 2 on
on the east of the Indus, are comprised within the extensive dominions of Timur Shah Abdalla, (unjustly called king of Candahar,) which extend wellnigh to the neighbourhood of the city of Teribah; including generally Cabul, Candahar, Peshawur, Ghizi, Gaur, Sizil, or Sizilatan, and Khorasan. This tract is at least 800 British miles in length, from east to west, and its breadth, though uncertain, does not bear any proportion to its length. It does not differ much from the tract comprised within the ancient kingdom of Ghizi. Timur Shah's Indian subjects are chiefly Afghans; the red, Persians and Tartars of almost every denomination. His government is said to be mild and equitable, with some degree of relaxation as to military discipline; which, in a government purely military, forebodes dilution.

Reynell's Memoir.

CABUL, a city of Afn in the above province, is the present capital of the successor of Timur Shah, and situated on a river of the same name, near the foot of the Indian Caucaus, or Hindoo Kho; and the proximity of this ridge occasioned the most rapid changes in the temperature of the atmosphere. Its situation is spoken of in terms of rapture by the Indian historians; it being no less romantic than pleasant; enjoying a wholesome air, and having within its reach the fruits and other products both of the temperate and the torrid zones. In a political light, it is considered as the gate of India towards Tartary; as Cabul holds the same place with respect to Persia. Mr. Forster, in his "Journey from Bengal to England," describes Cabul as a walled city, about 14 miles in circumference, and leant on the eastern side of a range of two united hills, generally the figure of a semicircle. The fortification, which is of a simple construction, with fearlessly a ditch, and the houses built of rough stones, clay, and unburned bricks, exhibit a mean appearance, and are ill suited to the grandeur that might have been supposed to subsist in the capital of a great empire. But the Afghans, he says, are a rude and unlettered people, and their chiefs have little propensity to the refinements of life, which indeed their country is ill adapted to gratify. From the Indus to the western limit of this extensive territory, there is an invariable deficiency of wood; infomuch, that the lower classes of people in the northern quarter suffer as much, perhaps, from the want of fuel in the winter season, as those of other countries would do from a scarcity of provisions.

This quarter of Afghanistan, sparsely but few Indian productions, receives sugars and cotton cloths chiefly from Persia, without it sends iron, leather, and tobacco. To Candahar it exports iron, leather, and lamp-oil; whence the returns are made in sundry manufactures of Persia and Europe, with a large supply of excellent incens. The Tartars of Buchara bring to Cabul the horses of Turkistan, furs, and hides; the latter resembling those in Europe called Bulgarian; the amount of which is applied to the purchase of indigo, and other commodities of India. The adjacent parts of Usbeck Tartary, of which Balk is the capital, hold a kind of dependency on Timur Shah.

The Afghans are the indigenous possessors of a tract of country, which extends from the mountains of Tartary to certain parts of the Gulf of Cambay and Persia; and from the Indus to the confines of Persia. The inhabitants of this wide domain have no written character, and speak a language peculiar to themselves. They are a robust, hardy race of men, and being generally addicted to a state of predatory warfare, their manners largely partake of a barbarous turbulence, and they avow a fixed contempt for the occupations of civil life. See AFGHANS.

Ahmed Abdalla, first king of Candahar, was originally the chief of an Afghan tribe, conquered by Nadir Shah, on whose death he suddenly appeared among his former subjects, and soon erected a considerable kingdom in the eastern part of Persia, including most of the Indian provinces ceded by the Mogul to Nadir. He established his capital at Cabul. Ahmed died about the year 1775, and was succeeded by Timur, who continued to reside at Cabul; but the monarchy has been styled that of Candahar from a central province. The successor of Timur was Zaman, who probably still rules this extensive country. Cabul is situated in N. lat. 34° 57'. E. long. 68° 34'.

CABUL, a river of the above-mentioned province, has also the proper name of Kamsh or Kamah from the vicinity of Jalalabad, 62 or 70 miles below the city of Cabul down to Peshawur. At Jalalabad it is navigable for jachts, or rafts of a particular construction; and no embarcations in hollow vellastarein ufe, we may infer that the navigation is interrupted by rapids, for the water of the Kamah is sufficient to carry boats. The Cabul, after receiving the rivers of Bujore, Penjokech, Chundoul, and Sezuw, joins the Indus at Attock.

CABURE, in Ornithology, the Brazilian name of the great eared owl of that country, Stryx Brasiliiana of recent authors. The Cabure of Willughby is the same bird.

CABUSEIBA, in Botany. See Myroxylon Peruviunum.

CALYBARA, in Zoology, an animal of the Cavia genus, distinguished specifically by having no tail; fore feet three toed, and palmated. Schreb.

This animal grows to the length of about two feet and a half; the head is oblong; snout narrow; nostrils black and roundish; upper lip flat; whiskers black; eyes large; ears short, erect, naked, and black. It inhabits the eastern parts of South America, where it frequents rocky woods near large rivers; swims and dives well; feeds on fish and vegetables, the former of which it catches in the night; brings forth one young at a time. This is the thick noded tapir of Remnants.

CABYLA, in Calypso, an animal of the Callida genus, and the most of the immediate descendents of the most ancient inhabitants of the country, and in this respect frequently denominated Brescas or Brescas (See Breeds); and partly the mixed progeny of the aborigines and of the nations who in former times invaded the country and settled in it; but all of them have always been and still are distinguished from the other inhabitants of the country by their language, love of freedom, and rude unpolished manners. The Cabyles are divided into distinct tribes, many of which are free and independent, and do not acknowledge the superiority of Algerians; especially those who inhabit the inaccessible ridges of mountains. The neighboring tribes are often united by friendly alliance, without subjugating themselves to a common head. Others live in a continual state of contention and feud with their neighbours, the chief cause of which are the fidelity and Melbourne of their wives. They are, in general, well-grown, robust, meagre, and of a tawny-brown red, and often blackish-yellow complexion, and have black or dark-brown hair. Their external appearance is rendered still more uncouth by dirt and tattered clothes. They commonly dwell in huts; though stone-houses occasionally occur in their "dakaras" or villages. Their number decreases, and their love of liberty gradually declines. The inhabi-
tants of the highest parts of the mountains, however, still affect their independence, and defend their liberty with undaunted valor against every hostile attack. Their courage, concurring with a perfect knowledge of the country, saves them from the superior force of their enemies, as the Algerines have, within a late period, frequently experienced. The government, therefore, endeavors to maintain a good understanding and friendship, where force is ineffectual, and often yields even to unreasonable demands. Thus the Cabyles of Conco are treated with great lenity; for the situation of their country is favourable, and they can assemble a strong army; and they carry great quantities of oil and soap for sale to Algiers. The cafe is the same with respect to the Cabyles who inhabit the sea-coast about Bugia, Bona, and Tabarca. Among the Cabyles, who acknowledge no common chief, those of the greatest age are particularly honored; and only their priets, or "Marabuts," enjoy the general confidence of the tribes, and have under the cloak of religion acquired great power and authority, which in force influences have become hereditary. These then act in the capacity of heads of the tribes, form treaties of peace, send ambassadors, and are by others, and even by the Turks, considered as the chiefs of the nation. In the vicinity of the capital of a deceased Marabut, or fain, is generally the habitation of the Marabut of the tribe, who, by means of a flag hoisted on a pole erected upon the edifice, gives the usual signal when the time of prayer arrives. From the same place signals are made, on the approach of the enemy, to the Cabyles, to assemble them at the appointed place of rendezvous. The language of the Cabyles, like that of the Moors, is a dialect of the Arabic. It deviates, however, so much from the latter, that in many places Moors and Cabyles are not able to understand one another.

CABYNE, in Geography, a small island in the Indian ocean, southerly of Martinique; and near the island called Hageden or Izsard-island.

CAçABELOS, a small town of Spain in Leon, seated in a valley between high mountains; 30 miles N. W. of Leon.

CACABOGA, in Zoology, the name of an American serpentine, by some accounted the same with the Tarbohias, or black water snake of that part of the world; but by others described as being of a yellow colour, living about houses, and doing great mischief among poultry, although its bite is not fatal to mankind. This is an ambiguous species.

CAÇACA, in Geography, a town of Africa, in the kingdom of Fez, taken by the Moors from the Spaniards in 1534, is defended by a strong fort on a rock; 16 miles S. of Mohila.

CACAGUAULES, a town of North America, in the country of Mexico, and province of Tlaxcala.

Gen. Ch. Cal. common, simple, oblong, somewhat calyced at the base, cylindrical; scales five to ten, or more, equal, lanceolate-linear, forming a tube, with a few short ones incumbent on the base. Cor. compound, tubular; florets hermaphrodite, uniform; border four or five-cleft, cleft, gradually thickening into the tube. Stem. filaments five, very short, capillary; anthers cylindrical, tubular. Py. germ oblong; style thread-shaped, the length of the flaments; filaments two, oblong, revolute. Per. the permanent calyx. Seeds solitary, narrow-ovate; down capillary. Recept. naked, flat, dotted.

Eff. Ch. Cal. cylindrical, oblong, somewhat calyced at the base.

Of the Limneas in his Species Plant. and Syll. Nat. admitted some plants into this genus, which in opposition to his own generic character are without the short scales at the base of the calyx. These are now placed under a distinct genus, for which Limneas's original name Kleinia has been revived. La Marec in Encyc. and professor Martyn in his edition of Miller, still, however, adhere to the arrangement of Limneas. The latter has inconsistently retained the original generic character, which the former has altered so as to adapt it to all his species.

Species. * Stems fibiously.

three feet high, upright but weak, round, fleshy, marked with lines of a deeper green, branching; young branches jointed. Leaves scattered, generally pinnate; pinnules oblong, toothed or entire, the end one largest. Jacquin. Pinnatifid or halate, but more frequently ternate-pinnatifid; the segments lanceolate, spreading very much, the two lowest distinct; the sinus rounded. L’Herit. Runcinate, or sometimes simply halate, situated towards the summit of the branches and stem. Flowers white, or slightly tinged with red, in a loose corymb; peduncles long. La Mark. Obs.

According to Jacquin, as quoted by Professor Martyn, the calyx is without incumbent scales at the base, which would make it a Kleinia; but Wendlow, who had access to a living plant, continues it under calisia. A native of the Cape of Good Hope. S. C. papillaris, Linn. Sp. Pl. (Kleina Hort. Clf. Calcalianthemum Dill. eth.) "Stem befit with truncated, petiolarly spines; leaves lanceolate, plain." Perennial. Stem about three feet high, cylindrical, befit on all sides with apparently truncated tubercles, which are the permanent petioles of fallen leaves. Leaves three or four inches long, nearly cylindrical, with a longitudinal furrow, glaucous-green, scattered about the summit of the branches. A native of the Cape of Good Hope. 9. C. Kleina, Linn. Spec. Plant. (Kleina, Hill, Clf. Calcalianthemum Dill. eth.) "Stem compound; fears of the petioles obsolete, leaves lanceolate, flat; flowers corymbosus." Stem thick, fleshy, cylindrical, branched, smooth; the scars of the fallen leaves a little more or less branched; branches smaller at their juncture and seemingly jointed. Leaves four or five inches long, fleshy, pointed, slightly furrowed on their upper surface, growing in tufts at the summit of the branches. Peduncles solitary, in the centre of the tuft of leaves, each supporting a corymb of oblong, pale-carnation coloured flowers. La Mark. Receptacle narrow, sprinkled with obsolete papillae, naked or smooth. Sepals oblong, nearly cylindrical, smooth, rufescent; stem longer than the calyx, of a fleshy white; rays capillary, very minutely dentilicate. A native of the Canary Islands. By some gardeners it has been called cabbage tree, from the resemblance of its flakes to those of cabbage; by others, carnation tree from the shape of the leaves and colour of the flowers. Miller. 10. C. Adora, Willd. "Leaves lanceolate, flat; flowers umbellate." Vahl. Symb. 3, p. 90. Perennial. Stem erect, branched, scarred, with three white, elevated lines proceeding from each pair upwards and downwards. Leaves at the summit of the younger branches, fleshy, scattered, thick, smooth. Peduncles six or seven, fleshy, forming an umbel from the furtums of the branches, and furnished at their base with a few lanceolate scales. Calyx cylindrical, five-leaved, smooth, with two linear leaves at its base. Vahl. Found by Forskall on the mountains of Arabia Felix. 11. C. Antemphurum, Linn. Spec. Plant. 1108. (Kleina Hort. Clf. Antemphurum, Bauh. Pin. 257. Dod. pamp. 158. Lob. ic. 1, p. 26. Moris. Hist. 3, p. 343. tab. 37. fig. 10. Dill. cth. 63. tab. 55. f. 2.) "Leaves ovate-oblong, flat, with a triple line at the base of the petioles." Perennial. Stem several, three or four feet high, cylindrical, as large as a man’s finger, irregularly branched. Leaves succulent, pale green. It was formerly esteemed a specific against the poisonous effect of euphorium. A native of the Cape of Good Hope. It has been cultivated in European gardens since 1576, but it very rarely flowers. The flower figured by Dillenius was produced in the garden of Mr. Bladwine at Diriham in Gloucestershire. 12. C. rigidissimus, Willd. "Leaves ovate, obtuse, flat." Thumb. Prod. 142. Perennial. A native of the Cape of Good Hope. 13. C. arlytcula, Willd. "Leaves lanceolate, flat, smooth." Thumb. Prod. 142. A native of the Cape of Good Hope. 14. C. tomentosus, Linn. Sup. 351. "Leaves fleshy, lanceolate, toothed, tomentose beneath." Perennial. Found by Thunberg at the Cape of Good Hope. 15. C. aculeata, Linn. Sup. 352. "Stem tomentose; leaves petiolate, ovate-lanceolate, entire, very smooth above, tomentose beneath, revolute at the edge, panicled terminal." Perennial. Stems upright, bright. Leaves opposite, spreading at the base, and gradually drawn to a point, veined, the circumference of a bay leaf; petioles roundish, tomentose. Panicles small, crowded. Calyx with few flowers; the scales at its base rather large. It has the habit of an alepia. Found by Mutis in South America. 16. C. appendiculatus, Linn. Sup. "Stem tomentose; leaves ovate-heart-shaped, acute, angular, tomentose beneath; petioles with leafy appendages." Perennial. Stem angular, hairy. Leaves higher than the stem, on long petioles, a little angular, nerving, veining; appendages three pair of very few, opposite, entire, petioled leaflets; the largest pair situated the farther from the leaf. Peduncle furnished with a bract. Flowers yellow. Found by Maffon in watery places of the island of Teneriff. Another plant was found by him on the mountains of the same island which he judged to be a distinct species, but thyncn more Callisia thought it only a variety with a very smooth leaf, and leaves corymb-oblong, a little toothed, and not angular. 17. C. reticulatus, Willd. "Leaves heart-shaped, roundish, embracing the stem, toothed; flowers corymbosus." Vahl Symb. in. 91. Perennial. Stem branched; branches from the nerves of the decurrent leaves, angular, smooth, thickened at the joints under the leaves. Leaves resembling those of borbonia crenata, alternate, alternate, with an inch long, smooth, reticulated with veins; teeth, as well as the edges of the reflexed leaves, thickened; nerves of a blood-colour at the base. Corymb somewhat fagitate; peduncles and pedicels smooth; with a small bilabiate base of the pedicel. Calyx fimbriate, smooth; pedicels about twelve, fimbriate, equal. Stem simple, the length of the calyx. Vahl. 18. C. procumbens. Martyn’s Miller. (Rumph. Amb. t. 103. f. 2.) "Stem somewhat shrunken, procumbent; leaves ovate-lanceolate, slightly serrated, fleshy; racemes elongated, interrupted." Lour. Coquin. 485. Perennial. Stems nine feet high, procumbent, round, equal, smooth, succulent, branched. Leaves bright green, smooth, alternate, petiolate. Calyx cylindrical, even. Flowers gold-coloured, few, long, with the segments of the border erect. A native of China and Cochinchina, where it is used as a pot-herb.

CACAIA.

22. C. fimbriifolia, Linn. Sp. Pl. 1169. (Kleinii, Flor. Zeyl. Mulc Schnar, Rheed. Scedia undulatiflora, Plak. Amalch. 192. t. 444. f. 1. Chondrella zeylanica, Burm. Zeyl. 61. S. ‘ambuvencis, Rumph. Amb. 5. p. 257. t. 103. Togo- linia, Pet. Gaz. t. 82. f. 13.) "Leaves embracing the stem, toothed; lower ones lyre-shaped; upper lanceolate, arrow- shaped." Willd. Root annual. Stem slender, a little branchy, about a foot and half high, round, and sprinkled with a few hairs. Leaves alternate, with a few hairs, especially on the ribs. Flowers terminal, about the fiese of those of common groundfeet, cylindric. Peduncles bristle-shaped. Calyx perfectly simple. The whole plant has the appearance of the common four-thistle, but it is easily distinguished from it by the simple calyx and tubular florets. A native of Ceylon, Malabar, Ambon, China, &c. A decoction of it is esteemed a febrifuge and antimalassic; its juice is given in diarrhœa. 24. C. fagittata, Willd. "Leaves toothed, the lower ones petioled, obovate; the upper oblong-lanceolate, arrow-shaped, embracing the stem." Vahl Symb. iii. p. 92. excluding the synonyms. Annual. Resembhng the preceding, but three times larger in all its parts. Lower-leaves petioled, obovate, not lyre-shaped. Flowers of an elegant orange-purple colour. A native of Java. 25. C. hieracioides, Willd. "Stem simple; leaves petioled, obovate, toothed." Annual. Stem a foot high, erect, sometimes with one or two very small branches from the axils of the lower leaves. Leaves alternate, obtuse, remotely toothed, smooth on both sides; the uppermost lanceolate, s€fille. Flowers somewhat corymbose. Peduncles alternate, pubescent, supported by a lanceolate bracte. Calyx with twelve lanceolate leaves, and many flowers. A native of the East Indies. 26. C. bicolor, Willd. "Stem branched; leaves lanceolate, smooth, toothed; those of the stem embracing it; those of the branches petioled." Willd. Roxburgh. Stem two feet high or more, erect, smooth, flariated. Peduncles very long, terminal, feally, one-flowered. Calyces twelve-leaved, many- flowered, the size of those of C. fagittata. Floras purple. A native of the East Indies. 27. C. incaua, Linn. Sp. Pl. "Leaves lanceolate, toothed." Stem erect, tall. Leaves feebly petioled, rather thic. Peduncles terminal, branched, long, naked, or with one or two very small leaves. A native of the East Indies. 28. C. rotundifolia, Willd. "Stem branched; leaves roundish, petioled, repand, pubescent; flowers corymbose." Stem two feet high or more, erect, round, flariated, lightly pubescent. Leaves alternate, small, scabrous on both sides, sprinkled with very short hairs. Corymb terminal, many-flowered, divericatied. Calyxes of twelve lanceolate leaves. A native of the East Indies. 29. C. foehra, Willd. "Radical leaves petioled, oblong, toothed; ilmen-leaves lanceolate, sessile." Vahl. Symb. ii. p. 92. Stem erect; a foot high, simple, round, flariated, hairy, especially at the base. Root-leaves two inches long, with unequal teeth, terminating in a sharp point, rather scabrous above, veined, narrowed at the base, and decurrent into the petiole. Stem-leaves few; the three lowest near together, an inch and half long, with four or five teeth on each side; the three upper ones remote, half an inch long, linear-lanceolate, very entire, erect. Petiole of the radical leaves long, hifrutae, flat. Flowers five, peduncled, alternate, situated near the summit of the stem; pedicels round, hifrutae, with a linear-lanceolate bracte at the base of each pedicel, and another in the middle. Calyx perfectly simple, of twelve linear-oblong leaflets the length of the florets. Downe sessile, feathered with very minute hairs, visible only under a lens. Vahl. A native of Brazil. 30. C. indica, La Marck. "Stem downy; leaves nearly deltoid, irregularly toothed, on long petioles; bracte bristle-shaped, invediting the peduncles." Stem about a foot high, clothed with a white cottony down, branched near the bottom, leafy. Flowers nearly solitary at the summit of each branch; scales of the calyx linear; peduncles cot- tony. A native of the East Indies, communicated to La Marck by Sonnerat. 31. C. saracenica, Linn. Sp. Pl. 1169. (Saldigdr Lamoniier, Off. 105. Sauv. Monps. 84. Gouan Monps. 144. S. peregrina, Vaill. Act. 366. Virga autea, Moril. Hydr. ii. p. 1063. C. saracenia, Zeyl. Chem. Act. Par. 1705. p. 394.) "Leaves lanceolate, fliatted, decurrent." Perennial. Stem two or three feet high, flariated, almost entirely smooth, leafy, straight, a little branched at its summit. Leaves alternate, pointed, sessile, or even embracing the stem, smooth above, and slightly pubescent beneath. Flowers pale yellow, in a termi- nal corymb. C 1 calyx nearly simple. Peduncles furnished with bristle-shaped leaflets. La Marck. A native of the south of France. This plant has fo strong a resemblance to Sence Saracenica, that La Marck has separated it from that genus chiefly in deference to the authority of Linnæus. 32. C. baflata, Linn. Spec. Pl. (Senee, Gmel. Sib. ii. p. 136. t. 66.) "Leaves three-lobed, acuminate, s€fille; flowers nodding." Perennial. Stem covered with a glaucous meal. Leaves hialate-deltoïd. Flowers of about five white florets, without the fetaecous bracts, except at the subdivisions. Anthers black. Peduncles hoary, somewhat tomentose, Linn. Calyx cylindric, consisting of many leaves in a simple or nearly double series, calyced at the base with acute scales. Receptacle rather flat, naked, with pentagon areas, inclosing a depressed little nipple. Seeds roundish, flariated, of a pale bay colour. Downe capillary, soft, white, minutely toothed, a little longer than the seed. Hirt. A native of Siberia. La Marck judges it only a variety of the preceding. 33. C. fiaracoa, Linn. Sp. Pl. "Leaves hialate-arrow-shaped, toothed; petioles dilated upwards." Perennial. Stems four or five feet high, flariated, leafy. Leaves alternate, pointed, smooth. Flowers whitish, in a terminal compound corymb; calyx and peduncle smooth, with fetaecous bracts under the calyx, and under the divisions of the peduncles. A native of Virginia and Canada. 34. C. atriphilfolia, Linn. Sp. Pl. (P a r o p h y l l u m, Grun. virg. i. p. 94. Narthus, Plak. alm. t. 101. f. 2.) "Leaves somewhat heart-shaped, toothed, sessile; calyces with five florets." Root perennial, com- posed of many feathery, spreading tubes. Stems three or four feet high, round, slightly flariated, leafy, a little branched. Leaves alternate, petioled, smooth, of a glaucous colour beneath; lower ones heart-shaped, rounded, as large as the human hand, with large, unequal indentures; those on the item heart-shaped, pointed, angular. Flowers small, ob- long, pale, or reddish, in a terminal, loose corymbus. Calyxes simple, conifilling of five or six linear leaflets, scarious at their edges. La Marck. A native of Virginia and Canada. 35. C. rectilinna, Willd. "Leaves petioled; radical ones between kidney and heart-shaped, toothed in a repand manner; item ones oblong, toothed, wedge-shaped at the base, very entire; corymb faltigata." Perennial. Radical leaves large, smooth, hairy underneath on the nerves; stem-leaves very entire, remotely toothed from the middle to the end. Corymb many-flowered. Calyx of five, lanceolate, obtuse leaflets. Floras numerous, white. It refembls C. atriphilfolia, but is clearly distinguished from it by the form of its leaves, and its fetaecous corymbs. A native of Pennsyl- vania. 36. C. pelatae, La Marck. (Alpina, Linn. Sp. Plant. Willden. 33.) but not all the synonyms, hiriflus, Villars Dauph. 3. 170. C. incaua folio, Claus. Hjfl. 2. p. 115. C. foliis crumplis hirifasis, Baulh. Pin. 195.) "Lower leaves large, roundish-heart-shaped, angular, toothed, stem-
of somewhat lanceolate, auricled at the base; corymb loose." Perennial. Stem three or four feet high, round, reddish, a little pubescent. Radical leaves near a foot in this species, toothed between the angles, green and four inch, with which and cottony underneath, resembling those of the common butterbur; petals long; stem-leaves smaller, opposite, or placed at the base with two roundish auricles which embrace the stem; upper ones lanceolate, sessile and embracing the stem. Flowers purple, in a terminal, loose, and branched corymb; flowers two or three: calyx simple, of four leaves. L. Marck. Bract linear at the base of each pedicell. Calyx calcified, with three linear, open leaves. Villars. Observed by La Marck on Mont d’Or, in Auvergne, in sheltered, moist situations, and especially in the ravines where it grows in abundance. There is a smaller variety with clustered flowers. "C. leucophylla," Willden. (alpina Tourn. ind. 453. tomentosa, Jacquin and Villars.) "Leaves petiolate, cottony on both sides, toothed; lower ones heart-shaped, acuminate; upper ones lanceolate; petals naked; flowers corymbose; calyxes many-flowered." Wilk. This species is remarkable for the whitenss of all its parts. Stem from twelve to fifteen inches high, straight, simple, cottony. Leaves alternate, frequently with two small auricles at the base of the pedicel. Flowers terminal, in several fascicles, or small, close corymbs; calyx of more than six leaves; florets from eight to fifteen. It varies in sometimes having the upper surface of the leaves green. A native of the Alps. This variety seems to be the alibrons of the younger Linnaeus and Willdenow, excluding all the synonyms quoted by the latter. 39. C. alliariifolia, L. Marck. (alpina. 2. Linn. pyrenica. Tourn. 452.) "Leaves between kidney and heart-shaped, ferrated, smooth on both sides, without auricles; calyx with about five florets." L. Marck. Perennial. Stem about a foot high, almost smooth. Leaves, especially the lower ones, rounded like those of crymionium alliaria, or rather those of caltha palustris, green on both sides, with branched nerves. Flowers purple, in a small, compound, terminal corymb. Calyx smooth, of five or six oblong, obtuse leaves. A native of the Pyrenees and the mountains of Dauphiny. Obs. Gouan’s description of his C. alliaria, (Lilliu. p. 65.) does not correspond with this plant, though he quotes some of its synonyms. 39. C. ecbinata, Linn. Sup. 353. "Leaves between kidney and heart-shaped, angular, toothed, downy beneath; leaves of the calyx tubercled." Found by Maffon on precipices in the island of Teneriff. 40. C. candicans, Wilk. "Downy; radical and lower leaves ovate, petiolate, crenate; upper ones feathery, elliptic, very entire." Vahl. Symb. 3. p. 91. t. 71. Stem a foot high, erect, simple, leafy, about the size of a swan’s quill, and, as well as the rest of the plant, the calyxes excepted, clothed with a very white wool. Radical leaves three inches long; lower stem-leaves three inches long; petals of the radical and lower leaves three inches long, flat, embracing the stem, dilated upwards into the leaf. Corymb terminal, many-flowered. Pedicel one-flowered, with an acuminate leaflet at the base of each. Scales of the calyx lanceolate, smooth. Flowers the length of the calyx. Vahl. A native of the flyer of Magellan. 41. C. scandens, Wilk. "Stem climbing; leaves triangular, minutely-toothed." Thumb. Prod. 142. A native of the Cape of Good Hope. Obs. The C. scandens of L’Heritier is the Eupatorium Scandens of Linnaeus removed to Mikania by Willdenow. 42. C. quinqufolia, Wilk. "Stem climbing; leaves five-lobed." Thumb. Prod. 142. Cape of Good Hope. 43. C. bipinnata, Linn. Sup. (pinnatifida, Berg. cap. 230.) "Leaves twice pinnate, linear." Stem erect, crisped, smooth. Leaves rather crowded, toothed, smooth, three inches long. Panicle terminal, somewhat filifoliate. Flowers yellow. C. hypoglaucifolium, five-leaved, five-flowered, acute. A native of the Cape of Good Hope. 44. C. bullata, Mart. Mill. "Leaves radical, lyrata; stem almost naked; petals few-flowered." Lour. Cochinch. 458. Root a roundish knotted, perennial bulb. Root-leaves toothed, somewhat fleshy, petiolated, few. Stem a foot and a half high, upright, round. Flowers gold coloured, on a terminating peduncle, several together. Calyx cylindrical, with a calyx of five thread-shape leafy bracts. Tube of the florets longer than the border, inflated, reflexed, with a short converging border. Stigmas two, long, erect. A native of China and C ochinechina. 44. C. pinnaatifida, Mart. Mill. "Leaves pinnatifid; segments lanceolate, ferrated; petiole twisted. Lour. Cochinch. 458. Stem two feet high, upright, thick. Leaves smooth, not fleshy. Flowers yellow, in a terminating panicle, few together. Calyx oblong, round. A native of China near Canton, among rice.

Propagation and Cultivation. All the parts which are natives of the Cape of Good Hope may be propagated during the summer months, by cuttings, which should be laid to dry a fortnight, that the wound may be healed over before they are planted; but if they have been kept six months they will take root. The pots in which they are planted may be plunged in a moderate hot-bed; but if they are planted in June or July they will root as well in the open air. They should have a light sandy earth, and in winter be placed in an airy glass-cage, where they may enjoy the sun and air in mild weather, but must be protected from the frost. Like other succulent plants from the same country, they must have little water in winter, and only a moderate quantity in summer.

The carioa increases fast by its roots, which may be parted either in the beginning of September or at the end of March. They should be planted in pots filled with light earth, and constantly kept in the tan-bed in the house.

The papillaria and antebphorum require a sandy poor soil, and must be kept very dry both summer and winter; but they require the open air in summer. The kleina, if kept in a dry warm glass-cage in winter, and in a warm sheltered situation in summer, will flower annually, and grow to the height of eight or ten feet.

The fondafloria is propagated by seeds, which succeed best when sown in autumn soon after they are ripe, and the pot plunged in the tan-bed in the house. In spring they may be sown in a hot-bed, and at a proper time transplanted into another hot bed, haging them till they have taken root. When the plants have acquired strength they should be planted in pots, and either plunged into a moderate hot-bed under a deep frame, or placed in a glass-cage, where they will flower and perfect their seeds. The fumariae and antebphorum multiply greatly by their spreading roots, and also by their seeds, which are waited to a great distance by the wind. The roots should be transplanted in autumn. They require a loamy soil, and a shady situation. See Mr. Baw’s Miller.

Calaia,
CACA

CACALIE, in Entomology, a species of Chrysomela that inhabits Austria: the colour is greenish, with a longitudinal streak on the wing-cases and future blue: wings red. Herb.

CACALIANTHEMUM, in Botany, Dill. Elth. See CACALIA Popilaris and C. Kleinia.

CACAALIA, or CAZALLA, in Geography, a town of Spain, in the country of Seville, famous for its wine; 40 miles N. of Seville.

CACALOTL, in Ornithology, the Brazilian name of the Corvus varius of Brillou, a variety of our common raven, according to Fernando's History of New Spain, &c.

CACALOTLI. Ray describes the lesser ani of modern writers, Crotophaga ani of Gmelin, under this name.

CACAMO. See ACAMANTIS.

CACAO, in Botany. See Theobroma and Chocolate. The cacao nuts are used by the Indians as money; 150 of the nuts being estimated at such the same value with a Spanish ryal.

CACAO AUFFINIS. Sloane. See RANDA MITS.

CACAO, in Entomology, a species of Bruchus, found among the seeds of the Theobroma. The body is fuscous with griseous spots. Fabricius, &c.

CACATETE, in Natural History, the name by which the Brazilians call the Belemnites, which is very common with them as well as with us.

CACAIPEHON, in Geography, a river of Virginia, which runs about 70 miles north-eastly along the western side of north ridge, and discharges itself into Potomack river, 30 miles N. of Fredericks-town.

CACARA, in Botany, Rumph. See DOLICHOS unguiculatus and prunicus.

CACASTOL, in Ornithology, the name given by Buffon to the Mexican stare, Sturkeus Mexicanus, a bird of a blue colour varied with black. Ray calls it Cassactostol, and Buffon Cotinga Mexicana.

CACCATOCA of Valint, in Ichthyology. See CORYPHAENUS PENTADACTYIUS. The fish called by the name writer CACOCACTA BARINTANG is the CHLATODON ARGUS of Brunnich, a species distinguished by having eleven dorsal spines, the body marked with many black dots, and the tail entire.

CACATORY fever, a denomination given by Sylvia to an intermittent fever, accompanied with a severe looseness, and sometimes gripes.

CACATÜA, in Ornithology, synonymous with Kakatou, and Cockato. Buffon calls the lesser white Cockato, PITTACUS SULPHUREUS of Gmel. Cacatua luteo-criffata. His cacatua minor is the red vented cockatoo of Brown; and the cacatua rubro-criffata, the greater red-crested cockatoo of Latham, &c.

CACAVALTE, in Botany, a name given to the cacao (Theobroma Linn.) in the general history of plants published at Lyons, 1587.

CACCARI, in Geography, a town of Naples, and province of Calabria Citra; 10 miles W. of Umbratelic.

CACCAYONE, a town of Naples, in the country of Molifice: 9 miles N. of Molifice.

CacciA, a small district of the island of Corfica. See ALGERI.

CACCIA, Ital. CHASE, Fr. a musical term for a Huntlnge-piece. Cornada caccia, a hunting horn, commonly called a French horn. Alla cacka, in the hunting style. See CHACE.

CACCINI, GIULIO ROMANO, in Biography, one of the first cultivators of recitative during the latter end of the 16th century at Florence. He is said, by Gio Battista Doni, to have been a young, elegant, and spirited finger, accustomed to attend the meetings of a society of learned noblemen and gentlemen at Florence; the members of which society were much displeased with the little respect that was paid to literary poetry by the composers of that time, who thought of nothing but fugues, canons, and crowded harmony, which being totally devoid of melody, rendered the words that were set in this manner wholly unintelligible; as the music was all in choruses, fugato, where every part was singing different words at the same time. Thee gentlemen wished to discover some kind of simple melody that would tune declamation, admit of harmony occasionally, and approach as nearly as possible to the declaration of the ancients; which they were sure was in musical intervals, as it was accompanied by instraments. Tuba pars et impares.

"Caccini being seized with a passion for this kind of music, studied it with great diligence, composing and singing to a single instrument, which was generally the Theorbo lute, played by Bardille, who happened then to be at Florence. In imitation therefore of Galilei, but in a more beautiful and pleasing style, Caccini set many canzonets and sonnets, written by excellent poets and set by such wretched scriblers (rimatetri d'azzizina) as were usually employed before, and are still frequented by the choirs of musicians; so that he may be said to have been the first to see this error, and to discover that the art of counterpoint will not alone complete the education of a musician, as is generally imagined. And he afterwards confessed, in a diffidence prefixed to his works, that the conversations held at Count del Vernio's were of more use to him, than thirty years' study and exercise of his art. Here he likewise claims the merit of having first published fongs for a single voice, which, indeed, had the greatest success. And it must be confessed, that we owe to him, in a great measure, the new and graceful manner of singing, which at that time spread itself all over Italy; for he composed a great number of airs which he taught to innumerable scholars, and among the rest to his daughter, who became a famous singer, and still continues very excellent in that faculty.

"In the recitative style, however, Caccini had a formidable rival in Jacopo Peri, a Florentine, who was not only a good composer, but a famous finger, and performer on keyed instruments, having been taught by Christoper Malvezzi; and applying with great diligence and enthusiasm to this kind of singing, succeeded wonderfully, and met with universal applause.

"The first poem set in this new manner was Dafne, a pastoral written by Rinuccini, and set by Jacopo Peri and Caccini, in a manner which charmed the whole city." See recitative and Opera.

Various experiments in dramatic music were made at the houses of the nobility of Florence, previous to the exhibition of the first serious opera, which was the Euridice, written by Rinuccini, and chiefly set by Jacopo Peri, for the royal nuptials of Mary of Medicis with Henry IV. of France, in 1600. Though the music of this drama went under the name of Peri, who performed it himself, yet he confesses in his preface that Giulio Caccini, "who gave a great merit was known to the whole world," composed some parts of it, and taught the fingers. Caccini himself afterwards set the entire drama of Euridice to music in filio Representativo, and published it at Florence. Specimens of his musical recitation are given in Burney's General History of Music, vol. IV. so that there can be no doubt but that Caccini was one of the first founders of the musical drama or OPERA, whence all the improvements in setting words.
words, in singing, and in producing instrumental effects by a well regulated orchestra for these last 200 years, may be

deducted.

CACCO, in Ornithology, one of the synonymous names by which Buffon distinguishes the long-billed rain euckow, Cuculus vulture of Gmelin, &c.

CACELLA, in Geography, a sea-port town of Portugal, in the province of Algarve, on the south-west, about 8 miles W. from the mouth of the Guadiana. N. lat. 37° 9'. W. long. 6° 40'.

CACERAS, or CACERES, a town of Spain, in the province of Extremadura, seared on the Sabor, and well known for its fine wool: 20 miles W. of Truxillo.

CACERES, a town of Asia, in the island of Luzon or Manilla, founded by the second governor and proprietor of these islands, D. Francis de Sando, and consisting of Indian huts and some convents, well built. It is the residence of a bishop, under whom are the provinces of Colba, Cara-

ines, and Talon. N. lat. 14° 15'. E. long. 124° 40'.

CACERES, a town of Spain, in the province of Extremadura, seared on the Sabor, and well known for its fine wool: 20 miles W. of Truxillo.

CACERES, a town of Asia, in the island of Luzon or Manilla, founded by the second governor and proprietor of these islands, D. Francis de Sando, and consisting of Indian huts and some convents, well built. It is the residence of a bishop, under whom are the provinces of Colba, Car-

ines, and Talon. N. lat. 14° 15'. E. long. 124° 40'.

CACHARON HEAD, the fourth point of Dominica island in the West Indies, and nearly N. from the north end of Martinico.

CAHACHES, in Ancient Geography, a river of Greece in the Phocide, which washed the walls of Tithorea, according to Pausianias.

CALLOT, or CACLOT, in Zoology. See Phyl-

siter Macocephalus.

CACHAN, or KASHAN, in Geography, a town of Persia, in the province of Isarc, which carries on an extensive trade in silk, stuffs, brocades, and fine earthen ware, inhabited by Chrillians and Guerbes; 50 miles N. of Isfahan. N. lat. 34° 10'. E. long. 50° 2'.

CACHAO, CHACO, CHECO, or KESHO, one of the eight provinces of Tonquin, seared in the central part of the kingdom, and encompassed by the other seven. Its soil is fertile, and some parts of the country are mountainous; it abounds with a variety of trees, and particularly that which yields the varnih. The silk manufacture is carried on in this province more than in any of the others. It takes its name from its capital, which is the metropolis of the whole kingdom; though Dampier reckons it as, in other respects, hardly comparable to a Chinefe city of the third rank, hav-

ing, however, a considerable population, which principally depends on the crowds of neighbouring villagers who retor to it at particular times, and especially on market-days, with their various commodities. These perfons are allowed to have their halls in different parts of the city, for the convenience of the dilpofal of their wares. The town itself, thought to be the constant residence of the Tonquinufe monarchs, has neither walls nor fortifications; and if we except the re-

yal palace and the arsenal, has little else worthy of notice. The streets are neither regular nor handsome; some of them, indeed, are airy and wide, but the reft are narrow, and all of them are paved; the houses are low and mean, constructed of wood and clay, and not above one story high. The magazines and warehouse belonging to foreigners are the only edifices built of brick. In various parts of the city there are, even in dry weather, ditches of stagnated water and thinking mud, which are very offensive to strangers; and yet, upon the whole, its airy situation, and serene air, render it healthy and pleasant to the natives; so that it is seldom, if ever, visited with those pestilential diseases that are com-

mon in large cities of those eastern climes. On account, however, of the materials with which its edifices are con-

structed, it is subject to frequent and dreadful conflagrations. As a preventive of the desolating effects of these calamities, every house is furnished with a low building of brick, in form of an oven, in which the inhabitants deposit, on occasions of any alarm, their most valuable property. The go-

vernment likewise obliges every family to keep a cittern, always full of water, on the top of the house, together with a long pole and bucket for throwing water upon the house. The chief palace of the chowha, or king, is situated in the centre of the town, and surrounded with a strong wall, en-

closing within its circuit a great number of apartments, two stories high; thofe of the chowha and his wives are embellis-

ed with a variety of carving and gilding after the Indian man-

ner, and are finely varnished. In the outward court are a

great number of sumptuous stables for the king's elephants

and horses; the inner courts are inaccessible, not only to

strangers, but even to the king's subjects, the members of

the privy council and the minillers of state excepted. This

enclosure, which is of a vast circumference, is faced with

brick within and without, and the whole structure is termi-

nated by spacious gardens. The king is a kind of prisoner

in this palace, and his authority is exercised by an officer,

whose family have long transmitted the executive power in

hereditary succession. The arsenal is a large building, well

flored with warlike ammunition and artillery. It stands

on the banks of the river Song-koy, and on that branch of it

which Dampier calls Domba, represented by him as the

deepest and widest of the two. The English factory-house

is situated on the north side of the city, fronting the river.

It is a low edifice, with a spacious dining-room in the centre,

and on each side are the apartments of the merchants, fac-

tors, and servants. At each end of the building are small

houses for other uses, which form two wings, with the

square in the middle, and parallel with the river, near the

bank of which stands a flag staff, on which they commonly

display the English colours on Sundays, and all other re-

markable days. Adjoining to this house, on the south side,

is the Danish factory, which is neither so large nor so con-

venient. On the same side of the river runs a long dike,

with its timber and fences strongly cemented together, which

prevents the river, during the time of their heavy rains, from

overflowing the city. This dike diphanges itself into the

gulf of Tonquin. Dr. Halley, in the Philosophical Trans-

actions, has given an account of the furrying tides in this bay;

each flux being of 12 hours duration, and its reflux the

same, so that there occurs but one high-water in 24

hours. Cachao, or Kefho, is the only city in the whole

kingdom, and is laid to consist of about 20,000 houses. N. lat. 22° 10'. E. long. 105° 31'. See TONQUIN.

CACHAR, a rich but mountainous territory of the king-

dom of Ava, lying north-west of Munniapooa, subject to

the independent sovereignty of a rajah. Its capital is Co-

pore.

CACHASSAE, in Ancient Geography, a people of Scy-
thia, placed by Ptolemy on this side of Imaus, between the

Norofii and the Afsaph.

CACHE, or, as it is called in China, CAYAZ, and in many

parts of India, Caz, Cazie, Cofie, and Chofie, in Commerce, a small copper coin, equal in value to a little more than a French denier.

CACHIZ, or CACHIEF, in the Turkish Affairs, the go-

vernor of a city, town, or even a province of Egypt.

The title cachief is also given to the captains or commander-

of little flying armies, intended to keep the Arabs in

obedience.

Egypt
Egypt is divided by the Turks into thirty-nine cachet- 
tees, or governments. 

CACHEMIRE, in Geography. See Cashmere. 

CACHEO, a town of Negroland in Africa, seated on the 
river St. Domingo, or Cacheo, and belonging to the 
Portuguese, who have three forts, and carry on a great trade there 
in slaves and wax. N. lat. 12° 5', W. long. 16° 20'. The 
river divides into several large branches before it falls into the 
ocean. 

CACHET, Christopher, in Biography, born at Neuf-
chateau in Lorraine, the 26th of November 1573, received 
the rudiments of his education among the Jesuits. To 
prove himself farther, he visited the principal states of Italy, 
but purposing to practice medicine, he fixed his residence at 
Padua, and after finishing his studies there, he settled at 
Nancy, where he arrived at the highest honours in his pro-
fession, being physician and aulic counsellor to four of 
his sovereigns, as appears by his epitaph, under his portrait, in 
the house of the Cordeliers at Nancy, where he was buried 
sept. 30, 1624.

Ut erat bono publico natus, 
Lucem literis, nomen libris, laudem suis, Patriae gloriam, 
 famam sibi, 
Principibus fepe fahem peperit. 
Serenissimus ducibus 

Archiet et confiliarius. 

He was author of several works; "Controversie Theorice 
Practice, in primam Aphorimorum Hippocratis Secctio-

Opus in duas partes divinit, Philosophus ac Medi-
cus peritile et pericundum. In quo quacunque ad Ve-
nacionem, Purgationem, et Vitus Rationem pertin-
ent, encondtur, &c." Tulli Leucorum, 1612, 8vo. "Pan-
dora Bacchica furesis, Medicis Armis oppugnata, 
"Tulli, 1614, 12mo. "Apologia dogmatica in Hermetics ejufidiam 
amoni scriptum de curatione Calculi, in qua Chymi-
curum Inceptarum vanitas exploditur," Tull. 1613, 8vo. 
"Vrai et affuré Preferatif de la Petite Volee et Rougee;
"1617, 8vo. The only art here taught is to keep children 

DiC. HilL. 

CACHETUS, in Ancient Geography, a river of Asia, 
in the kingdom of Pontus, near the town of Heraclea, accord-
ing to Diodorus Siculus. 

CACHEXIA, a term applied by the older writers in 
Medicine, to denote those conditions of the body, from what-
ever cause they may arise, in which the functions are im-
perfectly performed, and the complexion unhealthy. It is 
derived from καχεκή, bad, and εἴ, habit. The cachectic 
state of the constitution is supposed to depend upon an acrimo-
ny, or some other morbid change in the fluids of the body; 
and this seems to have been chiefly inferred from the change 
of complexion. Hence Van Swieten observes, that "aer 
physicians always examine carefully into the appearance of 
the skin, in those parts where the integuments are thin, and 
the vessels lie exposed, when they wish to know the condi-
tion of the blood and humours," § 1770. These hypo-
thefes, however, are now considered as unfounded. But 
upon whatever circumstances the cachectic state depends, it 
is obvious, that it occurs in all instances of flow confluence 
from acute and chronic diseases in general, and ac-
companies all lingering affections of the viscera and other 
parts; and therefore that it is essentially different in its na-
ture in different instances. Hence it is impossible to give 
a general history of it, as of a specific disease; or to enumerate 
the remedies which may be successfully employed for its 
cure. Where it is merely a debility, consequent on some 
fevere diseafe, moderate exercise, a light nutritious diet, 
and tonic medicines are indicated. But where it is a com-
monit of some organic affection, the nature of that must 
determine the nature of the remedy to be adopted. 

In the more accurate language of the present day, this 
vague and indefinite term is seldom employed. But it has 
been used with great propriety by Sauvages and Cullen to 
denote a particular class of diseases, in their respective sys-
tems of pathology; including those complaints in which the 
general habit is affected, and a change of complexion, with 
emaciation or morbid enlargement, are characteristic symp-
toms. Such are dropsy, jaundice, rickets, &c. 

CACHIBONA, or CILVE, in Geography, a river of the 
Island of Dominica, which runs into the sea on the east 
coast, a little to the north of Halifax bay. 

CACHICAME, in Zoology. Buffon's name of the Pig-
beak Armadillo; Dasyus numinicus of Linneus. 

CACHIMAYO, in Geography, a large river of South 
America, in Peru, which falls into the ocean within 2 
leagues of La Plata. 

CACHIQUE Tener and Bay, are situated on the coast 
of Barbary, in the Mediterranean, nearly W. from Algiers 
or 7 leagues. 

CACHOLOING, in Mineralogy. See Chalcopent. 

CACHOPS SANDS, in Geography, are two remarkable 
banks, which contract the channel of the mouth of the Tagus, 
in its influx into the sea, below Lisbon. 

CACHORROMATOS, in Zoology, the name by which 
the Portuguese in America call the Taini; a crea-
ture said to resemble the Opossum in many respects, and 
by some supposed to be the male of that creature. 

CACHRUS, in Entomology, a species of Papilio, (Plebe-
jius) with entire yellow wings, and a common fucous border 
spotted with white. Fabr. &c. This inhabits South America. 

CACHYS, in Botany, &c. The word is used in 
many instances by different authors, and has been the oc-
casion of great perplexity to the grammarians and commen-
tators. In Theophrastes (lib. iii. cap. 7.) it seems to de-
note the catkins of the oak, waultoin, pine, &c. by other 
writers it is used, sometimes for the root, sometimes for the 
feed of the plant to which modern botanists have given the 
name name, and sometimes for the plant itself. It also sig-
nified the feeds of roasted barley; and some have supposed 
that the plant derived its name from the resemblance of its feeds 
to those of barley. (See the notes on Theophrastus by 
Conklin and Bodenius a Stapel, p. 139, 140. Tournier. 
325. Vent. vol. iii. p. 36. Libanotis Cachyphorus, 
Rivi. Hil. Plant. p. 424. Clas and order, pentandria digy-

Gen. Ch. Col. universal and partial umbels manifold: 
universal and partial involucres, many-leaved, linear-lance-
olate, perianth proper, feecurcly dicernible. Cor. flowers all 
uniform: petals five, lanceolate, almost upright, equal, flat-
tift. Stam. filaments five, timple, the length of the corolla: 
anthers simple. Fil. germ top-shaped, inferior: styles two, 
inferior, the length of the corolla. Peric. fruit somewhat 
egg-shaped, obtuse, very large, splitting in two. Seeds two, 
very large, very convex on one side, flat on the other; of a 
fungous or dusty pungent substance, each enclosing a solitary ovate-
elong kernel. 

End. Ch. fruit somewhat egg-shaped, with a thick integu-
ment of a pungent subflance. 

p. 270. i. g. f. i, 2, 3. Vol. v. p. 106. Pl. 4. French 
translation. Gart. vol. ii. p. 274. Pl. 140. f. 3. " Rad-
ical
CAC

dictal leaves twice pinnate, white with down; stem naked; seeds perfectly plain." Root perennial. Stem four or five feet high, almost naked; branches alternate. Radical leaves large, unequally winged with five or three leaflets, elliptic, obtuse; crenulated, and sometimes lobed, pubescent, a little harrow to the touch, of a greyish green colour: leaves at the summit of each leaf, decurrent on the petiole. Flowers white. Involucres of from five to nine leaves. Germs covered with white hairs. La Marek. Seeds a little puny. Vahl. A native of Sicily, Spain, and Barbary.

CACHRY, CACHOS, or CATECHU. See CATECHU.

CACHUNDE, the name of a medicine highly celebrated among the Chinese and Indians, and made of several aromatic ingredients, the perfumes, medicinal earth, and precious stones: they make the whole into a stiff paste, and form out of it several figures according to their fancy, which are dried for use; there are principally used in the East Indies, but are sometimes brought over to Portugal. In China, the principal perfonus usually carry a small piece in their mouths, which is a continued cordial, and gives their breath a very sweet smell. It is a highly valuable medicine also, in all nervous complaints, and is esteemed a prolonger of life, and a provoking to venery, the two great intentions of most of the medicines in use in the East.

CACHYMIA, in Metallurgy, a term used by Paracelsus for an imperfect metallic ore, as he expresses it, an immature metallic body, which is neither a saline substance nor a metal.

The cachymia may be divided into sulphurous, as marcasite; mercurial, as arsenic or orpiment; and saline, as all tales.

CACIDARI, in Ancient Geography, a people of Scythia, on this side of Imaus, according to Phiny.

CACIQUES, in History, a denomination anciently given in America to governors of provinces and generals of armies. It was also appropriated to the sovereigns of the five great kingdoms into which the island of Hispaniola was divided when the Spaniards first visited it, and also to the sovereigns of the principalities or kingdoms in the other islands. Their power over the subject, which was hereditary, was absolute, and they were regarded with almost idolatrous veneration. Besides these, they were also subordinate chieftains, or princes, who were tributaries to the sovereign of each district. They seem to have somewhat resembled the ancient barons or feudatories of Europe; holding their poffessions by the tenure of service. Oviedo (lib. iii. c. 4.) relates, that they were under the obligation of personally attending the sovereign, both in peace and war, whenever they were so commanded. We have already observed, that the dignity of the Cacique was hereditary: but if Martyr is to be credited, the law of succession among them was different from that of all other people; for he observes (P. Martyr, decad. iii. lib. 9.) that the Caciques bequeathed the supreme authority to the children of their fathers, according to seniority, and disinherited their own offspring: being certain, as he further observes, that, by this policy, they preferred the blood-royal, which might not happen to be the case in advancing any of the children of their numerous wives. The account of Oviedo, however, is more probable; he remarks (lib. v. c. 3.) that one of the wives of each Cacique was particularly distinguished above the rest, and appears to have been considered.
filtered by the people as the reigning queen, and that her children, according to the priority of birth, succeeded to the father's honours; but, in default of issue by the favourite princes, the titles of the Cacique, if no brothers survived, took place of the Cacique's own children by his other wives. The principal Cacique was distinguished by regal ornaments, and numerous attendants. When he travelled through his dominions, he was commonly borne on men's shoulders; and he was held in such veneration, that if he ordered any of his subjects to call themselves headlong from a high rock, to drown themselves in the sea, merely at his own sovereign pleasure, he was obeyed without a murmur; opposition to the suprême authority being considered not only as unavoidable, but as impious. Their veneration extended even beyond death; for when a Cacique died, his body was embowelled, and dried in an oven, moderately heated, so that the bones and even the skin were preserved entire. The corpse was then placed in a cave with his ancestors; and thus they intended to render, not the name alone, but the person also, of their worthies immortal. If a Cacique died in battle, and the body could not be recovered, they composed songs in his praise, which they taught to their children, and these songs formed a branch of those solemnities which were called "Ariettes," confuting of hymns and public dances, accompanied with musical instruments made of shells, and a fort of drum, the sound of which was heard at a great distance. Martyr relates (Decad. iii. lib. 9.) that on the death of a Cacique, the most beloved of his wives was immolated at his funeral. But Oviedo (lib. v. c. 3.) denies that this custom was general among them.

CACOBE, in Ancient Geography, a people placed by Ptolemy in India, on this side of the Ganges.

CACOCHYMIA, from \*\*\*\*\*, bad, and \*\*\*\*, juice, or humour, a word formerly employed by medical writers to denote a suppuped morbid condition of the fluids of the living body.

CACODES, in the Ancient Writers of Medicine, a name given to several kinds of matter discharged from the human body, which had an ill smell. The offensive matter voided sometimes by vomit has this name, as also that evacuated by flood, and the discharge of foul ulcer.

CACOETHES, or Cacoethia. See Malignant.

CACONGO, in Geography, a kingdom of Africa, on the coast of Loango, situate between three considerable ports, much frequented by foreigners; viz. Loango, Cabinda, and Cacongo. The territory is in general flat, the air is more salubrious than that of Congro or Angola, and the soil also more fertile, on account of its frequent flowers, and its black mould, which, in the other adjacent kingdoms, is either chalky or sandy. The inhabitants are likewise more civilized, though not less superstition to the hallowed rites, than their neighbours. They bear the character of a treacherous, fraudulent, turbulent, and cowardly race; but they are much employed in traffic with the Europeans, and especially the Dutch, from whom they purchase a great variety of European goods, as coarse cloths, knit caps, huckeys, and other iron tools, linen, and other commodities, which they exchange for slaves at Congo, Angola, and other African states. This country is governed by its own hereditary princes, but under the protection of the kings of Loango, to whom they were formerly vassals, though they have since shaken off the yoke. The chief town is of the same name, and it is situated in S. lat. 4° 45'. E. long. 13°.

Cacongo, one of the chief rivers of the above kingdom, the others being the Kaja and the Cabinda. It runs 4 leagues S. of the Kaja, and 7 to the N. of the Cabinda, and is said to be navigable by boats of 10 tons burden. This river runs through almost the whole length of the kingdom from cap to cap, and after a course of about 80 or 90 miles, falls into the sea, near the town of Cacongo. About 4 miles from its mouth is the town, or rather village of Melchera, where the sea makes a kind of semicircular bay, which affords a convenient road for the vessels that traffic thither, the whole coast between the Cacongo and Zaire being extremely dangerous and full of rocks and shoals. The lands on each side are fertile and delightful, and abound with elephants' teeth, which the Membates, who are situated on the other side of the Zaire fetch and carry to the port of Pinda, where the Portugese, or any other Europeans, buy and export them.

CACOORS, in Botany, a species of Mimosa, which fee. The seeds of this plant are mentioned by fir Hans Sloane as being thrown ashore on the Hebrides and Orkneys. See Molucca Bean.

CACOPHONY, compounded of \*\*\*\*, evil, and \*\*\*\*, voice, in Grammar and Rhetoric, the meeting of two letters, or syllables, or even of two words, which yield an uncouth and disagreeable sound.

CACOPHONY, in Medicine, denotes a vice or depravation of the voice, or specch; of which there are two species, aphonia and dysphonia.

CACOPHONY, Gr. in Musi, the combination of many sounds ill chosen, or out of tune, noice.

CACORLA, in Geography, a little town in Spain, in the country of Jaen, belonging to the archbishop of Toledo, 4 leagues E. of Ubeda.

CACOSIN, a town of the island of Cuba, 50 miles N.N.W. of Bayamo.

Gen. Ch. Col. superior, bell-shaped, coloured, five-pointed, deciduous. Cor. petals five, harpy egg-shaped, inserted at the divisions of the calyx. Stam. filaments very long, inserted in the calyx below the insertion of the petals; anthers ovate. Fil. germ inferior, angular; style simple, as long as the filaments; stigma acute. Peric. a kind of berry, five-angled, somewhat spindle-shaped, almost woody, pulp within, covered with a white skin or aril.

Eff. Ch. Calyx bell-shaped, five-parted, bearing the corolla; petals five; berry five-angled, one-seeded; seed arillate.

Obs. Nearly allied to Combructum and Fuchia, but differing in the fruit.

Species, C. cocinea. A perennial shrub, with a stem about five or seven inches in diameter, branched, climbing to the top of the highest trees, from which its branches hang down, clothed with leaves and flowers. Leaves alternate, ovate, acuminate, very entire, veined, green, firm, with an even surface, on very short petioles. Flowers scarlet, fleshy, scattered in long terminal spikes, with a long flat pointed bracteate to each flower. La Marck. A native of Cayenne.

CACTI, the third natural order in the fourteenth clas of Jussieu, with the following character. Calyx superior, divided at the apex. Petals definite or indefinite, inserted at the top of the calyx. Stamens definite or indefinite, with the same insertion as the petals. Germ inferior, simple; style simple; stigma divided. Berry inferior, one-celled, many-seeded; the seeds attached to its inner surface. Stem shrubby or arborecent; leaves alternate or none. It contains only two genera, Ribe, with definite petals and stamens, and Cactus, with petals and stamens indefinite. Jussieu observes that
that these two genera, notwithstanding the difference in the number of their flowers and petals, are closely connected by their inferior growth, ring-like, and one-celled fruit, with the seeds attached to its inner surface, and that the affinity is strengthened by the similar structure of the spines in several of their species. It is matter of much importance to the Linnaean genus Cactus, containing Ribes as more properly belonging to the Saxifragae, but forming the connecting link between that order and Cactus. This able botanist has fallen into a flight absurdity in calling an order which contains only the genus Cactus, Cactoideae; which in fact is only saying that Cactus is like itself.

CACTUS, (κακτούς), Gr. the name of a plant derived first by Theophrastus, and afterwards by Dioscorides, Athenæus, and Pliny. Theophrastus, whom the succeeding writers have nearly copied, speaks of it as a plant not indigenous in Greece, and peculiar to Sicily, producing from the root several creeping stems, with a broad and prickly leaf, which, when stripped of their bark, are eaten either fresh or pickled; with an upright stem besides, which he says is called pteris, and is eaten fresh but not pickled; and having a prickly pericarp, called aecula, which is likewise edible when separated from the down of the seeds, and resembles the head of a palm. Most of the earlier modern botanists, supported by the authority of Athenæus, suppose it to be the same plant which the Greeks called κακτούς, and the Romans Cardius, the Cypris scolythus of Linnaeus, or common artichoke; but Bedzius a Stapel strongly infilts, that it must be another plant not ascertained by modern botanists. See his Notes on Theophrastus, p. 627—629, where he has corrected the corrupt texts of Theophrastus and Athenæus, by comparing them with each other, and with the Latin of Pliny. What are called by Theophrastus creeping stems, are probably nothing more than the strong midrib of the broad prickly leaves. Linn. gen. 613. Schreb. 838. Willden. 666. Gaert. 799. Juss. p. 311. Vent. vol. 3. 376. Clark and order, scefandria monogynia. Nat. ord. Suculenta Linna. Cact. Juss. Cactoideae Vent.

Gen. Ch. Cact, superior, imbricated, tubular, deciduous. Cor. petals numerous, disposed in several ranks; the outer ones shorter, the inner rather larger. Stam. filaments numerous, inserted into the calyx; anthers oblong. Pfd. germ inferior; style cylindric; stigma head, multifid. Peric. berry oblong, umbilicated at its summit, one-celled. Seeds numerous, bedded in pulp.

Obf. Linnaeus, on account of the conformity in the parts of fructification, has united in one genus a numerous tribe of succulent plants, differing greatly from each other, and many of them from all other plants, in their general structure and habit, which former botanists had distributed into separate genera, under the names of Melocactus, Cereus, Opuntia, and Perelkin. He observes, that Melocactus is monocotyledonous, and Opuntia dicotyledonous; but that nevertheless they are of the same natural genus. Jussieu mentions the circumstance on the authority of Linnaeus, but gives no farther information on the subject, referring the germination of Melocactus, as well as the existence and nature of the pericarp in all the Cacti, to future inquiry.

* Echinomelocatus, turks'-cap, or melon-thistles; of a roundish form, in some degree resembling a melon.

Species 1. C. mammillaris, smaller melon-thistle. Linn. Sp. Plant. (Echino-melocactus minor, Herm. Par. 356. Tab. 136. Ficoides, Plum. Alm. 184. tab. 29. f. 1. Comm. Hort. 1. p. 105. t. 55. Brad. furcul. 3. p. 11. tab. 19.) "Round, covered with ovate, beardcd tubercles." The body of the plant consists of a roundish fleshy substance, fleshy, about the size of a man's fist, without remarkable angles, but felfet on all sides with numerous conic tubercles, which are cottony at their summit, and terminated by small diverging spines. There is also a flight cottony down between the tubercles. The flowers are small, whitish, scattered about the plant between the tubercles. The berries are of a purplish blue colour, according to La Marek, but are said by Miller to be of a fine scarlet, and continue fresh upon the plant through the winter. They have an agreeable flavour, and are very good to eat, especially when properly dried. Bosc. A native of South America, among rocks. 2. C. gloriosa, clustered melon-thistle. La Marek. Plum. Sp. 19. tab. 201. f. 1. "Ovate, downy, compound, growing close together, with papillary tubercles." In several respects it resembles the preceding, but differs from it in growing several together in a close group, in its graceful colour, and very white abundant down, in its size, which does not exceed that of a puller's egg, and in the red colour of its flowers. Observed by Plummer at St. Domingo, and described by La Marek from his MSS. It appears to be the Calderon of Miller, though that is said by him to be rather larger than the mammillot. 3. C. melocactus, great melon-thistle. Linn. Sp. Pl. (Melocactus, Basm. Pm. 354. Tourn. 653. Echinomelocactus, Chl. Exot. tab. 92. Lob. ic. 2. p. 24. Brad. Succ. 4. p. 9. tab. 32.) "Roundish, with fourteen angles." A roundish mass, sometimes more than a yard in circumference, and in its native country almost twice as large; consisting internally of a soft, green, fleshy substance, full of moisture; deeply divided into fourteen or fifteen regular, smooth, flat-sided parts; at the edge of the ribs furnished with a row of clustered, flat, straight, diverging spines, about an inch long, and red at their summit. Flowers red, situated at the top of the plant. A native of South America. 4. C. corallinus, crowned melon-thistle. La Marek. "Ovate, with twenty angles; crowned with a cottony pilous cap." About a foot high, fleshy ribs oblong or a little spiral; their ridges beset with a row of clustered diverging spines, about six or seven lines long, and generally a little curved; cap three inches and a half in diameter, composed of a white, very close cottony down, intermixed with clusters of red spines, which are fless than the bristles of a bristil, but not prickly. A native of South America. 5. C. nobilis, noble melon-thistle. Linn. Mant. "Roundish, with fifteen angles; spines broad, recurved." This species seems to hold a middle space between the last two; but its external surface is entirely red. It varies in its form, being sometimes ovate or conic, and sometimes more globular. Its ribs are oblique or spiral, and its spines long, white as ivory, and a little curved. A native of St. Domingo, among rocks on the coast. Obf. Mr. Miller makes four distinct species of the great melon-thistle, and thinks that if the islands in the West Indies were examined, many more would be found. Prof. Delau Mark considers them as only varieties. La Marek has made three species which we have adopted: though from the description in different authors, it is not easy to determine which are species and which varieties. They grow from apertures in the steep sides of rocks in the hottest part of America, and seldom live long when transplanted into a better soil. In times of great

CACTUS.
great drought, the cattle rip them up with their horns, tear off the outside skin, and greedily devour the fleshy moist part. The fruit is an agreeable acid, and is frequently eaten in the West Indies. Miller.

**Ere'ct cactus**, supporting themselves. Torch-thistles, or torch-wood.

6. C. cylindraceus, cylindric torch-thistle. La Marck, Juffieu. “Erect, weak, cylindric, not angular, but reticulated on their surface, with decussated furrows.” La Marck. “Teffulated with regular, rhomb-shaped, little areas, bearing spines on their elevated center.” Juss. Spines clustered, whitish, very sharp. A native of Peru. 7. C. trigona, three-fidied torch-thistle. La Marck. (C. petaiia. Linn. Syst. Nat. Jacq. Americ. 151.) “Stem erect, triangular, with scarlet, leafy fruit.” Nearly allied to C. triangularis of the next division; but differs from it in having a stem, which supports itself to the height of eight or ten feet; and, though it ripes still higher when it obtains the support of a neighbouring tree, does not attach itself by any radicle. **Flower** whitish, six inches in diameter, with scarcely any smell, opening in the night. **Fruit** of a thinning scarlet colour on the outside, furnished with obtuse leaflets, which are irregularly notched at the summit; pulp white, fleshy, sweet; seeds small, black, thinning. A native of Carthage, and other parts of South America. There is a variety which has a ftraight trilateral stem, almost as thick as a man’s body, furnished with blackish, very sharp, clustered spines, about two inches long; dividing at the top into triangular, fleshy branches, of a delicate green colour, undulated, or scollipted at their angles, and difpofed in a large spreading panicule. From the upper branches rise large beautiful white flowers, a little odoruous, flanding on a stem, furnished with fome feafly leaves. The **fruit** is yellowish, smooth, of the form and fize of a large apple, with a white fweet pulp, filled with fmall blackish seeds. Observed by Plumier at St. Domingo. La Marck observes, that it may perhaps be diflinguished from Jacquin’s plant; but as they agree in fo many characteres, he has placed them together, that he may not multiply species without neceffity.

8. C.paniculatus, La Marck. (Melocactus arborecens, Plum. Sp. 19. Tournef. 653. Cactus brachiatius, Burm. Amer. tab. 192.) “Trunk erect, panicked at the summit with quadrangular, joined branches; parts round, white, marked with red lines; fruit tubercled, yellowish.” This plant, in its habit and fize, exactly refembles the variety of the preceding species; but the interior petals are feaerely larger than a finger nail, crenated, very white, pencilled with fmall red lines. **Stemmas** entirely white; fruit ovate, a little larger than a goat’s egg, with reddish fpinous tubercles, and full of fmall seeds of a dark chevetan colour. A native of St. Domingo, defcribed by La Marck from the MSS. of Plumier. 9. C. tetragona, four-fidied torch-thistle. Linn. Sp. Pl. “Quadrangular, long, erect; angles comprefled.” Stemm seldom more than four or five feet high, branched, deeply and widely cut in a longitudinal direction, fo as to give it the appearance of having four thin wings. A native of South America. 10. C. pentagonus, Linn. Sp. Pl. “Erect, long, jointed, with about five angles.” Stem slender, fceleb, but upright; internodes about a foot long; cluf ters of spines without any fteeful down at their base. A native of America. 11. C. hexagonus, Linn. Sp. Pl. (Cereus Surinamensis, Ephem. n. c. 3. p. 349. tab. 7 and 8.) Herm. Par. 116. Raj. Dendr. 23. C. maximus Americanus, Bradt. Succ. 1. p. 1. tab. 1. Melocactus, Plum. Sp. 19. Burm. Amer. tab. 191.) “Erect, long, with fix angles; angles diftant.” Stem thirty or forty feet high, not branched if the top be not injured, and it have room to grow; but whenever the stem is cut or injured, it puts out shoots from the angles, immediately under the wounded part, and frequently one or two lower down; thefe, if they are not cut off, form diftinct ilems, and grow upright, but are feldom so large as the principal stem. **Flowers** from the angles on the fide of the stem, as large as those of hollyhock, on a thick, fleshy, fealy, round, channelled, and hairy peduncle; calyx prickly, closely furrounding the corolla, green, with purple ftripes; inner petals white, and crenated at their extremity. Miller. A native of Surinam, whence it was introduced into Holland, and bore flowers in 1681. It was cultivated in England in 1690, and has been the molt common fort in the English fves, but has not borne fruit, nor often produced flowers. 12. C. heptagonus, Linn. Sp. Pl. “Erect, oblong, with seven angles.” Stem perennials, one or two feet high. A native of America. 13. C. repandus, Linn. Sp. Pl. Brown. Jan. 238. (Cereus altifimus gracilior, Sloan. Jan. 197. Hill. 2. p. 158. Raj. Dendr. 22. Trew. Ehret. t. 14.) “Erect, long, octagonal; angles comprefled, waved; spines longer than the wool.” Stem rather glaucous; spines intermixed with a yellow wool. **Flowers** greenish. Fruit about the fize of a walnut, red externally, and without spines. A native of Curafao. 15. C. rosenus, Linn. Sp. Pl. (Cereus Boer. Loc. 1. p. 263. Herm. 48. Par. 115.) “Erect, jointed, with nine angles; divifions between the joints somewhat egg-shaped; spines the length of the wool.” Perhaps only a variety of the preceding. Stem long; channels between the angles shallow, woody, and very fpinous; spines long, and yellowish; down pale white. Fruit red, and without spines. A native of America. 16. C. peru-vianus, Linn. Spec. Pl. (Cereus peruvianus, Bauh. Pfl. 458. Lob. c. 2. p. 25. Cierge epineux, Act. Acad. 1516. p. 146.) “Erect, long, with about eight angles; angles obtuse.” Stem branched in its upper part; angles furnished with fmall clusters of brown, very fdehyde, diverging spines, proceeding from a cotony tuft. **Flowers** lateral, almost fellite, solitary, whitifh, five or fix inches in diameter; fcales of the calyx fleshy, green, purplifh at their extremity; petals about thirty, lanceolate, white, with a tint of bright purpl in their fummit; flamen very numerous, fhorter than the petals; anthers yellow; flyle the length of the flamen; stigma with ten ftrait divisions. There is now, or at leaft in 1803, there was growing at the Mu feum of Natural History in Paris, a fupcrb plant of this species near forty feet high. It was prefented more than a hundred years ago, by Hotton profecor of botany at Leyden to Pagon infirphysician to Lewis XIV., and Superintendent of the royal garden, when it was only four or five inches high. The growth of each year is diftinguifhed by a contrac tion of the stem; each of these contractions is at firft very deep, and remains nearly the fame for five years, when it gradually diminishes, and at length is entirely obliterated. This plant grew at firft about a foot and a half in a year, and when it was fourteen years old was twenty-three feet high and feven inches in diameter. At the age of eleven it produced its firft two branches, about three feet from the ground. A year after it produced its firft flowers, and has continued to flower ever since. See Dic. Agric. Nouv. Encyclopédie. A native of Peru 17. C. similis, La Marck. Burm. Amer. tab. 195. f. 1. “Erect, long, with
with about eight angles; petals fringed, fruit spinous, scarlet." Steins growing many together, about the thickness of a man's thigh, and from eighteen to twenty feet high; conic and very spinous at their summit, befit at their angles with clusters of white, long, very sharp spines. Flowers at the summit of the stem, rather large; style much longer than the stamens. Fruit globular, fleshy, nearly the size of an orange, of a bright shining red colour, rough with tubercles and armed with whitish, sharp spines; flesh of a flame colour, very tender, of an agreeable, acidulous flavour, and filled with numerous black seeds. La Marck from the MSS. of Plumer: A native of St. Domingo. 13. C. polygona, La Marck. Burm. Americ. tab. 156. "Erect, branched, with eleven angles; fruit sappy, red." This species is nearly allied to C. repandus, but is distinguished from it by the number of its angles, and by the red colour of its fruit, and of the down on its summit. Stem perennial, about ten feet high, and fix or seven inches in diameter; angles waved, and befit with clusters of small spines: bark greyish, thick, covering a woody substance nearly as durable as oak, with an abundant, succulent, greenish pith. Branches from the summit of the stem, straight, long, a little larger than a man's arm, fleshy, greenish, with angles and spines similar to those of the stem, terminating in the shape of a cone and cloathed near the summit with a very red woollly down. Flowers growing near the summit, solitary, white, about the size of a crown piece. Fruit fleshy, the shape and size of a fig, reddish brown without, succulent, nearly inipid, feeds small, black. La Marck from the MSS. of Plumer: A native of St. Domingo. 19. C. menarum, Encye. Diction. Agricul. Bof. Nouv. Dict. Thierry de Menoville, Traité de la Culture du Nepal 1786. "Erect, with many angles, branched; fruit without spines, fleshy, brown without, red within." Nearly allied to the preceding, but less in size, not so much branched or spinous, and of a darker green colour. Flowers red. A native of Guazaca and Thegsuanc in South America, where it is known by the name of Pitabiah; and is greatly esteemed by the natives on account of its delicious fruit. Linneas has applied the same name to a very different species, which La Marck, whom in this instance we have followed, has called trigonus. 20. C. aurantiiformis, Encye. Díct. Agricul. Bof. Thierry. "Erect, with many angles, branched; fruit spheric, gold-coloured." Habit of the preceding. Flowers white. Fruit containing a white, inipid, but refreshing pulp. A native of St. Domingo. 21. C. divaricatus, La Marck. (Milocætus, Plum. Spec. 19. Burm. Am. tab. 193.) "Very spinous; trunk erect, frilated, branched at the top; branches straight, frilated, standing out on all sides; fruit gold-coloured, tubercled." Stem a little thicker than a man's thigh, three or four feet high, greenish; formidabley armed with numerous, very sharp, diverging spines. Flowers lateral, near the summits of the branches. Fruit globular, a little larger than a man's fist; pulp white, sweetish; feeds small, brown. A native of St. Domingo.

*Creeping Cereus with lateral roots. 22. C. grandiflorus, great or night-flowering, creeeping cereus, Linn. Spec. Plant. (Cereus candelas minor, Miller Icon. Tab. 69. C. gravilis scandens ramosus, flor ingenti, &c. Trew. Ehr. Tab. 31, 32. Eph. Nat. Cur. 1752, vol. ix. app. 184. Tab. 11, 12, 13. C. americanus, major articulateus, Volk. Hepf. t. 133-134.) "Creeeping, with about five angles." Stem cylindric, branched, greenish; angles not very prominent; spines small, clustered, diverging. Flowers lateral, about six inches, sometimes near a foot in diameter, sweet-scented; calyx large, long, tubular, fleshy below, composed in its upper part of straight, linear, pointed, yellowish leaflets, dissipated in several rows, and forming a kind of ray to the flower; petals white, numerous, lanceolate, dissipated in several rows, in a beautiful rosaceous form; style a little longer than the stamens; stigma with twenty divisions. The flowers begin to open between seven and eight o'clock in the evening, usually in the month of July, are fully blown by eleven, and by three or four in the morning they begin to fade, and soon after hang down in a state of irrecoverable decay. The plants are large, several flowers will open in the same night, and these will be a succession of them for several nights together. Fruit a little larger than a goose's egg, covered with scaly tubercles, fleshy, orange or red, of an agreeable acid flavour; feeds very small. A native of Jamaica, Vera Cruz, and St. Domingo. 23. C. flagelliformis, pink-flowered, creeeping cereus. Linn. Spec. Pl. Kniph. Cent. 1. Tab. 12. Knorr. Del. 1. f. 8. Curtis Bot. Mag. 17. 54. (Cereus minor scandens, flor purpureo, Ehr. Sel. 2. f. 2. Trev. Ehrb. t. 30. Ficoides Americanum, Pluk. Alm. 148. t. 158. f. 6. Sloane Jam. 197. Hilt. 2. p. 258.) "Creeeping, with ten angles." Stem cylindric, channelled, about the size of a man's little finger, from three to five feet long; spines numerous, wak, clustered, proceeding from elevated points or tubercles. Flowers lateral, fesile, oblong, of a lively pink colour; calyx coloured, tubular, its lower part composed of small, straight, sharp scales; petals and upper leaves of the calyx oblong, acuminate, of a similar colour, and distinguished from each other only by their size; stamens the length of the interior petals; filaments very white; anthers small, yellow; style the length of the stamens, stigma scarcely divided. It produces more flowers than the preceding species, which keep open three or four days, if they have not too much warmth. The fruit had been produced, but not ripened, at Chelsea, in the time of Mr. Miller. A native of the warmer climates of South America. 24. C. paraditicus. Parafitic creeeping cereus. Linn. Spec. Pl. "Creeping, round, frilated, without spines." Professors Martyn supposes it to be the root of some species of Epidemenum, but La Marck gives the following synonyms and description. Cacus repens parafiticus inermis aphyllus, ramosus, propendens. Burn. Jam. 238. Opuntia minima, Plum. Sp. 6. Burm. Amer. tab. 197. f. 2. Steins fender, cylindric, jointed, branched, clinging or pendant from the trunks of large trees: when young befit with prickles, but losing them when old, and retaining only the remnants of them, which form greyish, fleshy tubercles. Flowers small, lateral, fesile: Fruit not so large as an common pea. A native of St. Domingo. 25. C. pendulus, flender, creeeping cereus, Willden. Martyn, Swartz. 77. Burm. Jan. 238. (Caffytha bacefera, I. Mil. Illut. Caffytha polyperma, Ait. Cat. Hort. Kew. Rhipalais Caffytha, Gart. t. p. 137. Tab. 28. f. 1.) "Branches in whorls, round, smooth, without spines." A native of Jamaica, hanging from the largest trees to the length of two or three feet. Gartner observes that, though Sir Joseph Banks had hinted to him in a letter that it ought to be referred to the genus cacus, he was induced to keep it separate, because the embryo of cactus is lightly spiral, and the albumen of the seed farinaeous; whereas there is no albumen in this, and the embryo fills the whole cavity of the seed. 26. C. triangularis, triangular creeeping cereus, Linn. Sp. Pl. Brown. Jam. 468. Jacq. Amer. 152. 75. Afl. Hdlv. 5. 268. t. 2. (Cereus Brul. Succ. 1. p. 4 t. 3. Eph. Nat. Cur. 1752. v. ix. app. 109. tab. 10. f. 14. 1754. v. ix. app. 340. t. 3. Ficoides, Pluk. Alm. 147. t. 29. f. 3.) "Creeping, triangular," Perennial. Steins long, climbing up trees, and
CACTUS.

and supporting themselves by lateral roots, branched, twisted, jointed, oblong, fleshy, near three inches in diameter, contracted at the joints, with small clusters of short spines on their edges. Flowers large, white, lateral, solitary; the lower and tubular part of the calyx confining of short scales, green at their base, and reddish at their summit; the others longer and sharper, with a yellowish point. Fruit ovate, the size of a goose's egg, red without, and within marked with projecting tubercles, which are the remnants of the fallen scales of the calyx, superior in flavour to that of any other species. A native of the Antilles, Jamaica, Guiana, and Brazil. It is cultivated in the island of Barbadoes for the sake of its fruit. There is a variety with more scaly fruit, red without and white within, of a sweetish but less pleasing taste.

Off. The plants of this and the preceding division have been called Cereus from cera, wax, on account of the fancied resemblance of the limbs of some of the species to a wax candle; and torch thistles, or torch wood, because the Indians use them as flambeaux. The very improper appellation of thistles is derived from their prickles.

**** Opuntias, Indian figs, or prickly pears, composed of articulated divisions growing one upon another, and commonly compressed or flattened at their sides. These plants are said to be proliferous, because the parts of the stem are separated from each other by so deep a contraction, that they seem rather distinct individuals than ramifications of the same plant. 27. C. moniliformis. Necklace Indian fig, Linn. Sp. Pl. (Melocactus, Plun. Sp. 19. i. 168. Burn. Am. tab. 198.) "Proliferously jointed, divisions globular, spinous, gomernate." From the root, which is reddish, branched, and rather woody, there springs first a globular stem about the size of a green walnut, fleshy, tender, of a lively green, and beft with long, brown, sharp spines; from this globe soon proceed two others exactly similar, each of which produces two others, and so on successively, till the whole forms an affemblage of globes, spread on the ground, and united together like the pearls of a necklace. Flowers on the upper globular divisions red, solitary, sessile. Calyx furnished with acute scales at its base; style much longer than the petals. Fruit bright red, a little larger than a pigeon's egg; pulp white, tender, of a pleasant acidulous taste. Seeds small, of a gold colour. La Marck from the MSS. of Plunier. 28. C. opuntia, common Indian fig, or prickly pear, Linn. Sp. Pl. Brown Jam. 237. n. 2. Allion Pied. n. 1932. Plenck. Ic. t. 173. Gott. t. 138. f. 3. La Marck Illust. Pl. 114. (Opuntia vulgaris, Buhl. Hist. i. p. 154. Mil. Icon. 191. Tourn. 239. Plum. Sp. 6. Hall. Helvet. ii. 1909. Ficus indica, L. Ic. ii. p. 241.) "Proliferously jointed; divisions ovate, compressed, spines bristle-flapped." Six or eight feet high. Divisions about a foot long, eight inches broad, and one inch thick, fleshy, rounded at their edges, green, firm, attenuated at their base, appearing rather like leaves than divisions of the same flem, and having been sometimes, but erroneously, so called. As the plant grows old, the lower divisions incroace more in thickness than in length and breadth; and the joints swell and enlarge till they equal the other parts of the stem, and form a cylindrical trunk. The lower divisions sometimes hang down so as to touch the ground, and take root one after another, till at length a large space is covered by a single plant. The young ones have on their surface numerous fleshy, cylindrical, pointed protuberances, several lines in length, and at least one line in diameter, which do not remain more than two months, and are succeeded by clusters of spines. These are considered by La Marck as proper leaves, but are said by Lancry (Encyc. Dict. Agricul.), to be rather rudiments of leaves. Flowers yellowish, generally on the upper edge of the divisions, but sometimes on their sides; petals about ten; ovate-wedge-shaped; stamens not longer than the petals, irritable, when touched, before they shed their pollen; stigma with from five to ten divisions. Fruit nearly the shape of a fig, generally of a deep red colour, enclosing a red succulent, sweetish pulp, which is laid to make the urine of those who eat it red blood, without producing any other sensible effect. A native of America, like all the other species, but is now naturalized in many parts of the south of Europe, and on the coast of Barbary. A variety of it is found in America, as far north as Nova Scotia and Newfoundland, which is larger than the common sort, and armed with stronger spines; the fruit alto is much larger, and of a deeper purple colour, the divisions rounder and more compressed, and the whole plant more upright. Mr. Miller's figure is taken from a specimen of this variety sent him by Mr. Peter Collinson. 29. C. Ficus indica, Linn. Sp. Pl. oblong Indian fig. (Opuntia folio oblongo media, Tourn. 239.) "Proliferously jointed, divisions ovate-oblong, spines bristle-flapped." This has the branches growing more upright than the former, and has longer spines; the fruit is also larger and of a deeper purple colour. It is the most common sort in Jamaica. 30. C. tuna, Linn. Sp. great Indian fig. (Opuntia major validissima fimbriata, Tourn. 239. Sloane Jam. 103. Hift. ii. p. 149. t. 344. f. 1. Tuna major, Dill. Eft. 396. t. 295. f. 380.) "Proliferously jointed; divisions ovate-oblong; spines awl-flapped." This has stronger branches than the preceding, with larger whita spines. The flowers are bright yellow. There is a variety with strong black spines and purplish fruit. La Marck considers the latter the two only varieties of C. opuntia, and adds, as another variety, the opuntia miniata folio frutetudo of Tournefort, which is rarely more than half a foot high, with divisions two or three inches broad, and few spines. 31. C. coccinellifer, Cochinchine Indian fig, Linn. Sp. Pl. Brown Jam. 237. (Opuntia maxima, Sloane Jam. 194. Hift. ii. p. 152. t. 8. f. 1. 2. Tuna, Dill. Eft. 399. t. 297. f. 383. Ficus indica, Plun. Alm. 146. t. 381. f. 2.) "Proliferously jointed; divisions ovatc-oblong, nearly without thorns." About fix feet high. Divisions a foot long, five or six inches broad, and near two inches thick; spines few and harmless. Flowers few, blood-red; stamens longer than the petals, by which it is decisively distinguished from the last three species. A native of Mexico and other parts of South America. This species is said by Linneus, and has been generally supposed by others, to be the plant on which the Cochinneal insect feeds; but Thiery de Mounville is of a different opinion, founded on his personal observations at Mexico. 32. C. tufulideus crassus, tortoise-leg Indian fig, Thiery. "Proliferously jointed; divisions oblong, compressed, but in a zigzag manner, woody; spines numerous, very large, white; fruit spherical, green." In the course of a year it will grow to the height of ten feet, and produce thirty shoots; and in three or four years acquires the size of a tree. Divisions situated perpendicularly one upon another, and so bent as to produce, in the ideas of the colonists, a resemblance of the paws of a tortoise in the act of walking. Flowers aurora-coloured. Fruit unpleasantly acid. A native of Yerel places in St. Domingo. 33. C. luteus, yellow Indian fig, Thiery. "Proliferously jointed; divisions compressed, ovate; woody, nearly without spines; flower and fruit yellow; petals spreading." A beautiful plant growing to the size of a tree. Fruit egg-shaped, of an agreeable flavour. 34. C. compeckianus, Thiery. "Proliferously jointed; divisions compressed, oblong, woody, with few spines; flower and fruit red; style longer than the stamens and petals;
petals convolute." Smaller than the last two. *Divisum* obovatum, dark green, smooth, thinning; spines not more than two together. Petals of a bright reddish purple colour; stigma sulphur-coloured, with six divisions. Fruit the size of a pigeon's egg, truncate at the summit, blood-red throughout, rather hard, armed with spines. A native of St. Domingo. 35. *C. fistulosus*, wild cochineal Indian fig, Thierry. "Proliferously jointed; divisions compressed, very spiny; flower and fruit red; petals spreading." Not rising into a tree, and seldom excelling eighteen or twenty feet in height. *Divisum* pale green or yellowish, from ten to fifteen inches long, and from five to ten broad; spines white, from ten to fifteen in a cluster, crossing each other so as almost to cover the surface. Fruit the size of a walnut. A native of the inner parts of Mexico, and the most common species from Tehuacan to Guazacua. The wild cochineal infect feeds on all the four preceding, but is most fond of the last; and is found on it in such numbers as to destroy whole divisions, and, in the opinion of Thierry, to prevent its growing to its full size. 36. *C. splendidus*, superb Indian fig, Thierry. "Proliferously articulate; woody, very large; divisions ample, oblong, glaucous; those formed in the third years, spiny; the younger ones nearly unarmed: spines rigid and pungent." A large tree. *Divisum* numerous, thirty inches long, from twelve to fifteen, and even twenty broad, befet with tufts of luff, red bristles, which are very spreading, and easily infuse into the skin, so as to become very troublesome when neglected. In the older divisions these tufts are accompanied by three spines of unequal size, very strong and sharp: the others have rarely more than one or two, and often none. The beautiful glaucous colour of this species, its immense size, the vigorous and rich hues of its vegetation, with the number and amplitude of its divisions, render it, the most striking and magnificent of all its family, and give it, in Thierry's opinion, a j u x t a right to the epithet superb. This active naturalist never saw either the flower or the fruit, but was informed at Mexico, that the latter is delicious. It is not a native of Mexico, but is cultivated there solely for its fruit. Monf. Thierry brought it from Mexico to St. Domingo, and is convinced by experiments, made for three successive years, that it is equal to the *C. nopal* as a food for the true cochineal insect of the merchant and dyer. 37. *C. nopal*, Thierry. True cochineal Indian fig. "Proliferously jointed, woody; divisions compressed, ovate-oblung, perfectly smooth, green; those formed in the third years spiny; the younger ones nearly unarmed; spines rigid and pungent." Very similar to the splendids, from which it seems to differ, chiefly in colour. Monf. Thierry de Menonville is, however, well aware from all his inquiries and observations made on the spot, that this is the only species on which the true cochineal insect is bred in Mexico. He is persuaded that it does not grow wild in this country, and supposes that it is a variety of some unknown species, brought by cultivation to its present state of perfection. It differs from the *C. cocinellina* of Linnaeus and other native in being always found with spiny sharp spines. The latter is also said to grow wild in Jamaica, where *C. nopal* is entirely unknown. 38. *C. coriaceus*, coriaceous, or leaf Indian fig, or pinillow. Linna. Sp. Pl. (Opuntia minima Br. Druce. t. p. 5. f. 4. *Pitcairina indica*, Com. hort. t. p. 107.) 55. *Pluck. alc. 147. t. 201. f. 3.) "Proliferously jointed; slightly compressed, almost cylindric, lying in the middle." *Divisum* about three feet long, feble, and unable to support themselves, taking root as they lie on the ground, furnished with numerous clusters of white, sharp, slender spines. It is called pinillow in the West Indies from the resemblance of its branches to a pin- eusions stub full of pins. It flowered once at Badmington in the collection of the late duchess of Beaufort, and produced a yellow flower, but did not ripen its fruit. Said to be a native of Curasia. 39. *C. spinofragilis*, clusfer spined Indian fig. Wild. Att. Kew. 2. p. 158. *Mart. Hort. Can- tab. 89. La Mareck. en. 1. p. 557. *C. spinofragilis*, clusfer spined Indian fig. "Fruit feebly erct, compressed; divisions compressed, disposed crosswise; spines very numerous, long, yellowish." Nearly allied to *C. di- varicatus*, with which it would perhaps have been better associated, notwithstanding its compressed divisions. Stem from three to five feet high, not channelled or angular, producing near its summit, oblong, much compressed branches, in a cruciform direction, or making nearly right angles with each other; spines very slender in numerous clusters, each of which proceeds from a tubercle, and consists of two heads of spines; the lower ones long, few in number, and diverging; the upper ones small, numerous, and collected into a bundle like the hairs of a pencil. A native of Jamaica. 40. *C. phyllanthus*, spleen-wort-leafed Indian fig. Linn. Sp. Pl. Brown jam. 237. (Cereus, Dill. en. 73. t. 64. f. 7. 1. Opuntia, Sloan. jam. 216. hift. 2. p. 159. Phyllanthus, Pluck. alc. 295. t. 237. f. 5.) "Proliferous, evenflowed, compressed, fperate-repand." Distinguish from all the other species by its peculiar form. Divisions of the stem fword-shaped, much compressed, fcelle, about two inches broad, and from two to four feet long, bordered by large, rounded, indentures, and traversed longitudinally by a thick, cylindric nerve, so as to bear some resemblance to the leaves of focependium: spines none. Flowers in the indentes at the edges of the divisions, and at the summit, whites: calyx long, fnder, curved, greenish, fefet with fattered fcales. Fruit ecleul, bright red, with eight ribs, and fefy tubercles; pule white; feds black. A native of South America.

*Obj.* Professor Martyn has followed Willdenow in admitting a species on the authority of Swartz, which they call alatus: but it is evident from the description that it is no other than *C. phyllanthus*. Willdenow has most incantiously applied to both the synonym of Brown, (Jam. 237,) and has even transcribed it twice at full length, at the distance of only ten lines.

**** Furnished with true leaves.

The species placed under this section are totally different in habit from all the preceding, having not only real leaves, but items and branches similar to those of other trees and shrubs.

**C. por-
CACTUS.

C. portulaceifolius, Linn. Spec. (Opuntia, Plum. Sp. 6. ic. 197. fig. 1.) "Stem round, woody, spinous; leaves wedge-shaped, retuse." About the size of a common apple-tree. *Trunk* the thickness of a man's thigh, with spreading, spinous branches. *Leaves* alternate, in size and convenience like those of *C. peregrina*; with a solitary spine at the base, a little longer than the clustered ones on the branches. *Flowers* at the ends of the upper branches, probably monoicous, purplish, roseaceous; petals rounded, a little larger than a finger nail. *Fruit* globular, about the size of a common apple, without the tufts of leaves which are found on *C. peregrina*, greenish, with a whitish, mucilaginous, acid pulp. *Seeds* numerous, dark-coloured.

All the known species are perennial.

**CACTUS,** in Gardening, comprehends different curious plants of the succulent exotic kinds, of strange and singular growths, cultivated in this climate for curiosity in flowers and green-houses. They may be divided into the melon-thistle, the torch-thistle, and creeping cactus, and the Indian fig kinds. The species principally cultivated in the first fort, are *C. mammillaris*, smaller caust, or melon-thistle; *C. maho-caust*, melo-caust, great melon-thistle, or turks' cap. In the second kind, *C. tetraphactus*, four-angled upright cactus, or torch-thistle; *C. fuchsius*, five-angled upright torch-thistle; *C. hexagonus*, six angled torch-thistle; *C. heptagonus*, seven-angled upright torch-thistle; *C. repandus*, thresher upright torch-thistle; *C. languiences*, woolly upright torch-thistle; *C. peruvianis*, Peruvian upright torch-thistle; *C. royanii*, Rohey's upright torch-thistle; *C. grandiflorus*, great flowering cactus; *C. flagelliformis*, pink flowering cactus; *C. triangularis*, triangular cactus; or strawberry pear. And in the third fort, *C. megalanthus*, common Indian fig; or prickly pear; *C. ficus indica*, oblong Indian fig; *C. tunas*, great Indian fig, or prickly pear; *C. coccinellus*, cochinile Indian fig; *C. cactiflorus*, cactus; leaf Indian fig, or pin-pillow; *C. spinos interfusus*, clustered Spanish Indian fig; *C. phyllanthus*, spikenwort-leaved Indian fig; *C. aloates*, narrow jointed Indian fig; *C. manilliflorus*, neck-lace Indian fig; *C. perforata*, Barbadoes gooseberry.

The two first forts are plants of a very singular structure, having much the form of a large melon, without stems, branches, or leaves, sitting in a close manner to the surface of the earth, and differing in height from a foot to a yard, being deeply ribbed longitudinally in some forts, and in all closely armed with strong spines. They are perennial, both in root and top, continuing many years; affording ornament and variety in the flowers of hot-houses. Each species has several varieties.

The second fort also affords plants of highly curious succulent growths, in some of the species and varieties rising to a considerable height, and producing flowers of great beauty; and in others creeping or trailing to some distance, or hanging down over the sides of the pots that contain them—affording much variety in this way, as well as by their elegant and curious flowers, especially in some of the kinds, as the *grandiflorus*, and some others. The five-angled torch-thistle, and smaller creeping cactus, are the least tender.

In the third fort, the plants are likewise highly curious from their flabby succulent jointed growths, and being beft with sharp spines; in many of the kinds most of the species, except the first, are less hardy than those of any of the other two kinds. They, however, produce much variety in flower collections among other plants of similar growths.

**Method of Culture in the Melon-Thistle Kind.**

These plants may be increased with facility, either by fowing the seeds in pots of light sandy earth, and plunging them in the bark bed; when, after the plants have advanced a little in growth, they should be pricked out into separate very small pots, and plunging them in the bark bed, where they mayly make great progress, though it is often some years before they acquire any considerable size or growth; or by setting the young plants which issue from the sides of the old ones in pots of the same sort of earth, in the spring or autumn, managing them in the same way as those raised from seeds. But in order to have large plants at once, they may be procured from the West Indies in tubs of dry compact rubbish, care being taken to guard them well from cold and moisture. On their arrival they should be planted out in pots, and plunged in the bark bed till perfectly rooted, and become strong plants.

These plants should always be placed upon the tops of the flies or shelves of the hot-houses in winter, and in the bark beds in summer; very moderate waterings being given in very hot weather, but none at all in the winter season, as they are very succulent plants, and quickly rot by moisture.

**Method of Culture in the Torch-thistle Kind.**

These plants are constantly increased by planting the cuttings of branches, which have been laid in a dry place some weeks for the moisture to exhale, and the wounded parts to be healed over, in small pots in the summer season, filled with a compost constituted of one third light earth, the same quantities of sea-sand and sifted lime rubbish, well mixed together for some length of time before it is made use of, plunging them in the bark hot-bed of the flow; some rather coarse gravel or shells being previously placed in the bottoms of the pots to prevent the flagging of the moisture.

In the upright forts, the cuttings for this use may be provided by taking off the tops of such kinds as are wanted; the plants afterwards throwing out shoots below, so as to furnish plentiful supplies annually. But in the creeping forts, as there are various flanks and branches, these may be taken off in cuttings of from three to five or six inches in length, and be planted out in the same manner as the above.

About the beginning or middle of August, the plants, after being raised in this manner, should have air given them by degrees, in order to harden them against winter, but not be wholly exposed either to it, or the sun; and towards the end of September removed into the flow, or green-houfe, for the winter, during which season they must not have much water. The young plants should constantly have a dry situation in winter, as they imbibe the greatest part of their nourishment from the air, in order to prevent their roots from rotting; and should not be exposed in the open air, even in summer, unless under shelter, as rains are very injurious to them. Nor should the creeping forts be exposed too much to the open air, even in the hottest seasons; but, if they be designed to flower in winter, be kept very warm, and have no water given them at that period.

The great flowering creeping cactus, being a tender plant, requires a warm flow to protect it, in which it may be trained against the walls, or upon flicks. But the five-angled, and small fort, with pink-coloured leaves, are not so tender, being capable of being preferred in a good greenhouse, or when placed under a hot-bed frame, in the autumn, winter, and very early spring months.

**Method of Culture in the Indian Fig Kind.**

These plants are capable of being readily increased during the early summer months, by cuttings of the joints of the branches taken off, and planted in pots of light sandy compost.
post. These cuttings, previous to planting, should, as in
the other farts, be laid in a dry place, ten or fifteen days,
to heal over the cut parts; and the hot-house kinds, by be-
ing then plunged in the bark-bed, or other hot-bed, will be
greatly promoted in their rooting; but the green-house
fort, or common spinula, really strikes root without, though
it is greatly forwarded by such assistance. They all require
the earth to be occasionally moistened a little. In the summer
season, they likewise often require water, but it must not be
given in large quantities, lest it rot them; and in winter, it
should be proportioned to the warmth of the house; as, if
the air be kept very warm, they require to be often refres-
hed with a very little to prevent the branches shrinking: but if
kept in only a moderate degree of warmth, little is neces-
fary. The heat in which they thrive best is that marked
in temperate on botanical thermometers, as when kept too
warm in winter, it causes their shoots to be very weak and
tender. The farts which are inclined to grow upright
should have their branches supported with stakes, to prevent
their being broken down with their own weight. Plants of
this furt are mostly exposed to the open air in the summer
season; but they thrive much better when continued in the
flowers, provided they have free air; as when set abroad, the
rains much diminish their beauty, retard their growth,
and prevent their producing flowers and fruit in such
plenty, as when constantly kept protected in the house.

Cactus, in Natural History, a species of Madrepora,
with compressed, divergent, dichotomous, branches, carna-
nated at the margin, and fides continguously exteml, found
only in a fossil state. Forth. Ph. Arab.

Cacule, in the Materia Medica, a name given by
Avicenna, Serazio, and all the other Arabian writers, to
the cardamon seeds. They distinguished two kinds of this
fruit, a larger and a smaller. The larger is the grain of
paradise, and the smaller the common cardamon feed of
these times. They also called the cardamoms in general
by the name hell, and distinguished the small kind, now
principally in use, by the word billahe, which after-writers
corrupted into billave and billoua, or helvea.

Caculo, in Geography, a small town of Africa, near
the river Paleme, on its eastern bank. N. lat. 15° 56'.
W. long. 15° 20'.

Cacus, in Entomology, a species of Sphinx, with
black, indented wings, marked with three pale approximate
flarks; polliar pair black flattered with black. Cramer,
&c. Inhabitants Sumner.

Cacus, in Fabulous History and Mythology, the son of
Vulcan, represented by Virgil as a monster, half man and
half fator, and of an enormous height, discharging from his
mouth flames of flame. The fable reports that Hercules,
after the defeat of Geryon, conducted his herd
along the banks of the Tiber, and whilst they were feeding
fell asleep. In the mean while Cacus stole away eight
cows, and, in order to escape detection, drew them back-
wards by their tails into his den on mount Aventine.
When Hercules determined to quit these fartsures, the low-
ing of those bulls which remained was answered by that of
the cows which Cacus had stolen, and thus the theft was
discovered. Hercules ran with great fury towards the
cavern; but found its entrance closed by a large rock,
which was suspended by chains of iron forged by Vulcan.
However, he removed the rock and found his way into the
den amidst the flames and smoke vomitot by the monster,
seized him by the throat, and struggled him. In memory
of this victory, the inhabitants of mount Aventine observed
a yearly festival in honour of heroes. The Latin poets
have emulated one another in celebrating this defeat of
Cacus. The den of Cacus, says Bryant (Analysis of An-
cient Mythology, Vol. II. p. 22), was properly Cacbus,
the cavern or temple of Chus; from which the poets and
later historians have formed a strange personage, whom they
represented as a shepherd, and the son of Vulcan. There
certainly, he says, stood a temple of old upon the Aventine
mountain in Latium, which was the terror of the neigh-
bourhood. The etiologies of the priests, and their con-
tinual deprivations, may be inferred from the history of
Cocus. Virgil (Ec. lib. viii. v. 190, &c.) says Evander
defers the place to Aneas, though it is supposed in his
time to have been in ruins. Livy (lib. i. c. 7) mentions
Cocus as a shepherd, and a person of great strength and
violence. He is also mentioned by Plutarch (in Amatorios,
vol. ii. p. 762) as vomiting fire and flames from his mouth.
As in temples of this fort there were both priests and
priestesses, we read of a Cocus and a Caca. The latter
was supposed to have been a goddes who was made a deity
for having betrayed her brother to Hercules. Lacontius de
Falca Religionio, apud Inustit. lib. 1. c. 20. The learned
Bryant adds, that, under the charaters of Caca and Cacus,
we have a history of Cacidian priests, who seem to have been
a set of people devoted to rape and murder.

Cacuthis, in Ancient Geography, a river of India,
which, according to Arrian, discharged itself into the
Ganges.

Cacyparis, a river of Sicily, on the eastern coast,
between Syracuse and Helorim.

Cacyron, a town placed by Ptolemy in the interior
part of Sicily. The inhabitants are called by Pliny Cacyrini.

Cada Water, a river of Scotland, which runs into
Loch Fine; 9 miles S. W. of Inverary.

Cadaba, in Botany, La Marek Encyc. Forth.
Egypt. 63. (Streitida, Wilidd. 356. Vahl, Svm. l. p. 20.)
Claris and order, gendria pentandra Forth. Pentandra mo-

Gen. Ch. Calys four-leaved, spreading, deciduous. Cor-
petals four or none; claves filiform, the length of the calyx,
situated on the receptacle of the calyx, two on each side;
poles lanceolate, waved. Nel. tubular-ligulate, situated
between the upper division of the calyx and the receptacle
of the fructification. Stam. filaments five or four, inerited
on the peduncle of the germ; anthers upright. Pyr. germ
superior, cylinic, pedicelled; style none; stigma simple.
Peric. capsule pedicelled, cylinic, one-celled, two-valved;
valves revolute. Seeds numerous, kidney-shaped, disporfed
in three rows in a kind of pulp.

pedicelled, pulpy.

Obft. It resembles capparis in its pulpy capsules, and
cloee in its flowers. Its gynandrous flamen and tubular
ligulate nectary dillingu it from the former, and its fruit
from the latter. Vahl and Willdenow call the pericarp a
berry; Jussieu considers it as a fiqule. La Marek files it
both a fiqule and a capsule within the compafs of a few lines.
Its valvular structure is inconsistent with the effential charac-
ter of a berry; and the situation of its seeds does not cor-
respond with the definition of a fiqule: it is therefore properly
a capsule. We have preferred Forskall's original generic
name to that afterwards adopted by Vahl. If there be no
strong reason to the contrary, the right of priority should
always be respected.

Sp. 1. C. indicus, La Marek. (Cleome fruticosa: Linn.
Vahl.) "Leaves obovate egg-shaped, smooth; flowers te-
trandrous." A shrub. Stem cylinic, branched. Leaves
entire, alternate, petioled, sometimes obuse and sometimes
rather pointed, an inch long, and four or five lines breed;
petioles short. Flowers white, peduncled; in short, simple,
termi-
terminating racemes. Pedicel of the fructification about an inch long, making an obtuse angle with the peduncle of the flower. Capsule pulpuy, which determines it to be a cadaba, not a chombe. A native of the East Indies, whence Sou- nart seqts specimens of the flowers and fruit to La Marek.

C. C. Cadawald, Fornik. "Leaves circular, smooth." A middle-sized tree. Leaves alternate, flat, rather thick, sometimes slightly furrowed, and often margarinate, petiole half the length of the leaf. Flowers eric, in terminating racemes, without petals; nectary greenish; the ligulate part ovate, flat, red above and yellow beneath. Stamens inserted on the lower part of the pedicel of the germ. Fruit two inches long, cylindrical, swelling out in knobs, smooth, green: valves red within. Seeds black, in a dry reddish pulp. A native of Arabia.

C. C. varifolius, Fornik. "Leaves egg-shaped, oblong, mealy." A shrub. Branches round; covered, like the leaves, with a mealy down. Leaves alternate, obtuse, entire, flat, half an inch long. Flowers peduncled, in terminating racemes; petals waved; nectary white: flaments inserted a little below the middle of the pedicel of the germ. A native of Arabia.

C. C. glandulifera, Fornik. "Branches, leaves, calyx, and pistil glandular, vil- lous." A shrub. Branches round, as well as all the other parts of the plant covered with glandular hairs. Leaves half an inch long, petioled, alternate, roundish, entire, rough to the touch. Flowers nodding, from four to six, in a terminating raceme; capsule half an inch long, very hairy. A native of Arabia.

CADAHALSO, in Geography, a town of Spain, in New Cadile, surrounded with pleasant gardens and woods ; 6 miles N. of Efconala.

CADALEN, a town of France, in the department of the Tarn, and chief place of a canton in the district of Gal- lae ; 5 leagues S. E. of it. The town contains 1,627, and the canton 4,709 inhabitants; the territory includes 155 kilometres, and 7 communes.

CADAN, or KADAN, a town of Bohemia, in the circle of Szaz, seated on the Eger, and founded in 821 ; 10 miles E. of Szaz. N. lat. 50° 20'. E. long. 13° 34'.

CADAON, a river of Portugal, which forms the harbour of Setuval.

CADARA, in Ancient Geography, a town of Arabia Felix, on the Perian gulf.—Also, a large peninsula of the Red Sea, on the southern coast of Arabia, which formed an extensive bay, crossed by Ptolemy Philadephis in 12 days and nights. Play.

CADARI, or KADARI, a feât of Mahometans, who assert free-will, attribute the actions of men to men alone, not to any secret power determining the will; and deny all absolute decrees, and predetermination. The author of this feât was Mabed ben Kaled Al Gihoni, who suffered martyrdom for it. The word comes from the Arabic, 777, cadara, power. Ben Ann calls the Cadarians, the Magi, or Mani- chees of the Muffulmen. This name is given by some to the Motzaladites, though they disclaim it, and give it to the Jabarians, who likewise reject it as an infamous appellation, because Mahomnet is said to have declared the Kadarians to be the Magians of his followers.

CADAVAL, in Geography, a town of Portugal, in the province of Tras-os-Montes; 13 miles S.S.W. of Mirandella.—Also, a town of Portugal, in the province of Extremadura, including a district of eight parishes, and about 350 inhabitants; 13 miles S.E. of Peniche.

CADAYELLIO River, is about 3 leagues N.N.E., from the sand off the mouth of Lima river, on the coast of Peru in South America.

CADÆVERUM, in Entomology, a species of ACARUS, having the body somewhat bilobate, and the posterior part furnished with four bristles, which are longer than the body. Schrank. Found in the carcases of insects.

CADAMUS CAstra, in Ancient Geography, a place of Africa, in Mauritania Cæsariis, on the coast from Cadia to Rufucurrum. Antonin. ltn.

CADE, or CHIADA, in Geography. See League of God's houff.

CADE, a cage, caff, or barrel; used in the book of rates for a determinate number of some sorts of fish.—Thus a cade of herrings is a vessel containing the quantity of five hundred herrings, and of sprats one thousand.

Anciently the cade of herrings appears to have contained six hundred fish, reckoning six score to the hundred.

CADE bay, in Geography, lies on the south-west side of the island of Antigua, in the West Indies, and a little to the north west from Carlisle bay on the south of the island.

CADE's Infurrection, in English History, a formidable insurrection, which took place in Kent in 1450, and which was so called from the artful and bold adventurer, John Cade, by whom it was headed. Cade having collected a considerable number of the common people, by specious promises of reforming all abuses, whence he obtained the name of John Amend all, marched towards London, and encamped on Blackheath. From hence two addresses were sent to the insurgents to the king and council, artfully professing the greatest attachment to the person and government of the king, andrequelling the redress of grievances, together with the punishment of evil counsellors, who had oppressed the people at home, and occasioned the loss of the king's dominions abroad, and that the king would govern by the advice of the dukes of York, Exeter, Buckingham, and Norfolk, and the well-affected barons of the kingdom. These addresses, which had marked out for destruction certain members of the council, were rejected, and it was resolved to subdue the insurgents by force. For this purpose, an army of 15,000 men was ordered to march against the insurgents; and a detachment overtook and engaged them near Seven-oaks, but was defeated. Cade and his followers, elated by this victory, returned to their former station on Blackheath; and as the aspect of affairs was now become serious and alarming, lenient measures were adopted, and the archbishop of Canterbury and the duke of Buckingham were deputed to treat with the rebels. In the conference that ensued, Cade behaved with decency and firmness, but refused to lay down his arms, till the requisitions in his addresses were granted. After the return of the messengers, the court retired to Kenilworth castle, and the tower of London was garrisoned. Cade advanced to Southwark, and was at length admitted into London. Having seized and beheaded lord Say and Scale, late high treasurer of England, and his son-in-law sir James Cromer, sheriff of Kent, they proceeded to pillage the city; but they were soon driven out of it, and failing in their attempts to repulse them, they agreed to a short truce. A proclamation was issued from the tower, which announced a pardon under the great seal to all who immediately departed to their own homes; and this proclamation produced such an effect, that in a few hours the army, lately formidable, disappeared. Cade, finding that he was thus suddenly abandoned, put his boots on board a barge, and sent it to Rochester, and proceeded by land with a few attendants; but being denied admittance into Queborough castle, he diffimuated all his followers, and put on a disguise. A proclamation was immediately published, offering a reward of 1000 marks to any who brought him in, dead or alive. He was discovered lurking in a garden at Hothfield, in Suffolk,
by Alexander Eden, a gentleman of Kent, and, making some resistance, was killed, and his body was brought to
London. Thus ended an insurrection, which, under a leader of higher rank and greater honour, might have pro-
duced a revolution.

Cade Lamb, in Rural Economy, a young lamb brought
up in the house wholly by the hand. Where the ewe dies soon after bringing the young lamb may be preferred and
brought up in this way.

C. olf, (huile de Cade, Fr.) is an empyreumatic oil of
turpentine, thinner than tar, and obtained along with it in
the distillation of pine wood. It appears to be very similar to what is
called in this country spirit of tar. See TURPENTINE.

Cade's point, in Geography, lies at the north west end of
the island of Nevis, in the West Indies, and is the nearest
cape to Major's bay, at the south-east end of the island
of St. Christopher's, or St. Kitt's.

Cade-worm, in Entomology, a name given by some au-
tors to the larve of the phygmeus, which are found in
ditches, and used as bait for fish. See PHYGMEUS.

CADEL-AUANACU, in Botany, Rhed. mal. 2. p. 61.
t. 75. Rai. hif. 167. 1855. Sup. 112. 666. See Croton
Tiglium.

CADELI, Rhed. mal. See ACYRANTHES-OGFERA.

CADELUM, Ruph. Amb. See PHASEOLUS MAX.

CADEMOSTO, or CADAMUSTI, LEWIS, or properly
ALVISE DA CA DE MOSTO, in Biography, a celebrated
Venetian navigator, was born about the year 1432; and
having made several voyages in the Mediterranean, he left
Venice in 1454, and being accidentally driven by a storm on
the coast of Portugal, he was employed by the infant
don Henry in a voyage of discovery. A caravel was fitted
out and laden, chiefly at the expense of De Mosto, who embar-
ked in March 1455; with Vincenzo Diaz, to whom the
command of the vessel was entrusted, and proceeded to the
coast of Africa. Being joined at sea by two other vessels,
they failed to some distance beyond Cape Verde; but the
crews, through fear of the negroes, refusing to proceed
further, they were under a necessity of returning to Portu-
gal. In the following year, Cademisto, accompanied by
Ufomare, a Genoese, undertook a second voyage with three
vessels towards the same parts; and having passed cape
Blanco, they were driven by a storm on Cape Verde islands,
which had not yet been discovered. From hence, they
proceeded as far as the mouth of the river St. Domingo.
Cademisto, after his return to Portugal, published, in 1494,
an account of his voyage, which is valuable, as it contains
the earliest relation extant of the Portuguese navigations on
the African coast, and of the gold trade of Tombut, and its
principal branches. This work was first published at
Vicenza in 1597; it was afterwards translated into Latin
and French, and inserted by Grinnaeus in his collection enti-
tled "Novus Orbis," and by Ramufr in his collection of
voyages, and since in several others. The author refided
some years at Lagos in general esteem. He returned to
Venice in 1464, and after this period we have no further

CADENA, in Ancient Geography, a town of Asia Mi-
nor, in Bithynia.

CADENAC, in Geography, an ancient town of France,
in the department of the Lot, by which river it is surround-
ed, seated on a steep rock, which, having never submitted
to the English in their various invasions and conquests, was
involved with peculiar privileges; 25 miles E.N.E. of Cahors.

CADENCE, in Music, denotes a kind of close, or reit,
either at the end of a song, or some of its parts, into which
it is divided as into members, or periods.

The word seems a metaphor drawn from the dancing-
school, where it properly signifies a pause, or fall, from
motion to rest. A cadence is properly when the parts fall,
and terminate on a chord, or note, the ear seeming naturally
to expect it. Regularly it is to be made on the final or
dominant, though sometimes also on the mediant or middle
chord of a note.

Cadences in singing answer nearly to points or stops in
discourse. They are rests continued to favour the weak-
ness of the performers, as well as the hearers, of a musical
composition. Men are not able to sustain their attention,
or their voice, beyond the space of two measures; even
in this short interval we perceive the song to fall, and
tend rapidly to a pause, or rest: the notes which introduce
these pauses, are called cadences, on the proper conducing
and expresing of which a great part of the musician's skill
depends. The chief cadence or close is the key itself, in
which the bars must always conclude; the next in dignity
is the fifth above; then, if the key-note is made sharp, a cadence
may be made on the second of the key; after which (by
means of a sharp fifth) on the sixth; and by a sharp second
on the third of a key; after which, returning to the original
key and subject, when the hearer is reminded of both, by
means of a flat seventh, there may be a close in the fourth
of the key; after which, with a sharp seventh, the piece may
terminate by a final cadence or close in the original key.
See CLOSE, MODULATION.

In all these cadences, a major key is understood. For
cadences in a minor key, see COUNTERPOINT.

Dr. Pepusch's definition of cadences in music is, perhaps,
the most short, clear, and comprehensive, to be found in any
elementary book.

"Cadences in music are the same as stops in speaking or
writing; that is to say, they are endings or terminations
either of a part or of the whole piece of music, as stops
are of a part or of the whole speech. For which reason
they are distinguished into full cadences and middle cadences;
these last are like commas and semicolons, after which more
is expected to follow, they not making to full a stop as the
other; whereas after a full cadence we are sensible that
we are come to a conclusion." Treatise on Harmony, p. 4.

This author's arrangement of the modulation in the key
of C as the representative of all major keys, differs somewhat
from the present practice. It is however that of the
greatest masters of the early part of the last century.
C, G, E, A, F, c, which include all the concords to the
key note.

In a long piece of music, however, he allows a transient
modulation into D minor, as a sixth cadence. But Dr.
Pepusch's modulation into E differs totally from that of the
secular composers of modern times. It is, in fact, no
more than a semi-cadence on the fifth of the key of A minor,
with a sharp third; nor is the scale any thing more than
that species of octave aligned by most writers on ancient
music to the Dorian mode. See Mode, and ANCIENT
Music. It begins and ends in E without flat or sharp; F G A B C D E. Dr. Pepusch says, that "from
the peculiarity of its modulation, whatever is composed in this
mode or key is so solemn, and it seems so much appropriated
to church music, that it is called by the Italianas tondo di
ebifra. From the contemplation of this scale, the fieur
Blainville, in 1751, fancied, or wished others to fancy, that
he had discovered a new cadence, or key, different from the
major and minor, the second being minor, and the seventh
major. See DIET. de Roufseau, art. Mode.

The resolution of a discord, according to Roufseau, is a kind
kind of cadence. “And, as all harmonic phrases are necessarily connected by discords, expressed or understood, it follows, that all music may be said to consist of a succession of cadences.” The rule of the octave seems to favour this idea; as every other sound carries a discord. See Rule of the Octave.

According to Rameau, there are four kinds of cadences; the perfect, imperfect, interrupted, and disappointed.

Padre Martini’s cadences, in his Saggio di Contrappunto, being such as are peculiar to the ecclesiastical modes, will be of little use in secular music. The clohes of Haydn, Mozart, and Pacchierio however new, elegant, and ingenious the treble may be, are all built in the bases and harmony of the old clohes of 100 years ago; for in a full close, as the base must fall a fifth or rise a fourth, the treble must either fall from the ninth to the eighth, or rise from the seventh to the eighth.

In early days of counterpoint, the great fluidly of composers was cadences. A Studio di Palestrina being found at Rome in the year 1770, it was chiefly filled with cadences and chants, in his own hand-writing.

In melody, the preparation for clohes in the principal part are infinite; in harmony they are numerous, but may be numbered. Neither Rameau’s cadences, nor those of Padre Martini, quite satisfy us. In Galpinari there is an ample collection, chap. vi. per far le cadenze d’ogni forte. From these Walther has cited many, but more correctly; for Galpinari’s book, in the edition which we have seen, is imperfectly printed. The cadences in Walther are good, as far as harmony is concerned, which is not so changeable as melody; and to these, chiefly from Galpinari, we have all the Italian names: as cadenza maggior, minore, maggiora fiuma, cadenza fiuma, finta, fiorita, perfetta, imperfecta, irregolare, d’inganno, &c.

In ancient music, cadence is nearly synonymous with rhythm. The French make use of the term cadence for a trille or shake.

Cadence, in the Modern Dancing, is when the several steps and motions follow, or correspond to, the notes or measures of the music.

Cadence, in the Oratory, and Poetry, denotes the harmonious movement of verfe or prose, or otherwise called the numbers, and by the ancients rhymes. See Rhythm.

As to prose, Ariosto suggests that though it be not measured like verfe, it should nevertheless be numerous or harmonious (See Number); and Cicero enjoins the orator to take care to gratify the ear, “superlubimum aurium judicium.” Indeed, the finest thoughts will be delightful to a power to please, if they are expressed in terms that are harsh and ill arranged. As the ear is agreeably footed by a soft and flowing discourse, it is offended by want of harmony in the structure and flow of the periods; whether it

be occasioned by the excessive brevity and abruptness of termination, on the one hand, or by excess of length, a kind of crawling, languid, movement on the other, which are both alike disagreeing to a delicate ear. By observing a due mean between these two extremes, a discourse acquires that harmony which is adapted both to please and even to persuade. See Style.

As to the cadence of verfe, it depends, in Greek and Latin poetry, on the number and proper intermixture of those feet or periodic measures which enter into the composition of verfe, and which vary in the different kinds of it; and, in living languages, the cadence results from the number of syllables which each verfe admits, and from the riches, variety, and disposition of the rhymes. In the ancient poetry, says M. Rollin (Method of Teaching and Studying the Belles Lettres, vol. I. p. 249.) “There is a plain, common, and ordinary harmony of cadence, which supports itself alike universally, renders the verfe smooth and flowing, carefully throws out whatever may offend the ear by a rough and disagreeable sound; and, by the mixture of different numbers and measures, forms that pleasing harmony, diffused throughout the whole body of the poem.” “Besides this,” he says, “there are certain particular cadences, of greater significance, which make a more sensible impression. These sorts of cadences are very beautiful in verification, and add a considerable grace, provided they are used with prudence and address, and do not return too often. They prevent the tediousness, which uniform cadences, and regular returns, in one and the same measure, cannot fail of producing.” “In the Latin poetry,” he adds, “we have entire liberty to divide our verses as we please, to vary the paces (caesuras, or cadences), at will, and artfully to spare delicate ears the uniform returns of the daftyle and fpondees, which close an heroic verfe.” Accordingly he produces a variety of examples from Virgil, which seem to evince and illustrate the value of this kind of liberty, and the use that may be made of it. Thus, long words, properly placed, form a full and harmonious cadence, especially if there are several ppondees in the verfe, e.g.

Again, the spondeic verfe has sometimes a great degree of gravity. Virgil has used it very advantageously in the description of Simon’s surprize and astonishment.

“Namque ut conspectus in medio turbatus, inermis Confultit, atque ocellis Phrygia agrina circumspexit.” An. II. 67.

It is also very proper for expressing any sentiment that is sad and doleful; e.g.

“Quae quondam in buitis aut culminibus deferitis Nocete sedens, ferum canit importuna per umbras.”

An. XII. 863.

A monofyllabic at the end of a verfe serves sometimes to give it great force; e.g.

“Haec pede pes, defusque viro vir.” An. X. 361.

There are also several forts of suspended cadences, which have their peculiar graces; e.g.

“Et frutra retinacula tendens Furtur equi annigra, neque audit currus habens.”

Georg. I. 513.

Broken cadences likewise produce a good effect; e.g.

Eliothus contribute very much to the beauty of verfe, by making the numbers smooth, flowing, rough or majestic, according to the difference of the objects to be expressed. Spondees and long words, which give a flownefs and heavnefs to verfe, are proper for expressing sorrow; e.g.

“Extinctum
"Exstinctum nymphæ crudidi funere Daphnium

Joy, on the other hand, demands the rapidity of
dactyles: e.g.

"Sedantes fatusvos imitabitur Alphæus eruens." Elog. V. 73.

To express softness, we must select words consisting of
many vowels, with smooth and flowing consonants; and
avoid such syllables as are composed of several consonants,
harsh clitics, and rough letters or aspirates; e.g.

"Deveniere locus levis, et amæna victa
Fortunatorum nemorum, fedequc beatas."

Ex. VI. 638.

In expressing roughness, we must chuse words which be-
gin and end with an r, or which double the r; rough con-
sonants, as the x, or the aspirate h; words formed of
double consonants; and clitics: e.g.

"Ergo axé gratir rahris rimanunt." Georg. III. 534.

Lightness and liveliness are expressed by dactyles: e.g.

"Mox aére lapta quieto
Radi iter liquidum, celeres nescie commovet alta."  

Ex. V. 216.

Heaviness, on the other hand, requires spondæces: e.g.

"Ili inter sefe magna vi brachia tollunt
In numerum, verfantique tenaci forcipe ferrum."  

Georg. IV. 174.

In other cadences, words placed at the end have a pecu-
liar force or grace: e.g.

"Vox quoque per lucos vulgo exaudita filientes
Ingens." George. I. 476.

See Order, Junction, and Number.

Cadence, in Reading, denotes the falling or lowering of
the voice below the key note at the close of every period. They key-note, in speaking, is that tone or found with
which the modulation commences, and it is generally
continued through every complete sentence or period;
and to this the occasional inflexions of the voice,
either above or below it, may be supposed to refer. Of
course the tones that fall a little lower than the key at
the close of a sentence or period, are called cadences; and they
are sometimes distinguished into two kinds, under the
appropriate epithets of significent and ornamental; the former
serve to mark the sense and the latter to decorate the
modulation. In many extensive and long periods, the full
sense of which is long supfended, and where the final words
are not very important, the cadence is a kind of notice of
their termination, distinct from the pause, which, besides
the ornamental variety it affords, is a very necessary and
useful article in periphrastic elocution. As this cadence
naturally accompanies the termination of every sense, it
may sometimes fall before the fermat, but more generally
before the colon, as well as the period; for these marks
are often found to terminate a complete sense; and in such cases
the relation of that which follows to that which preceded,
is signified to the mind by the relative shortness of the top,
and the mode of introducing the additional matter. See
Modulation, Pause, and Punctuation.

CADENCED. An air or melody in music is said to be
well cadenced, when the rhythm is good, the accents well
placed, and the passages well phrased. See Rhythm, Ac-
cent, and Phrase.

CADENCY, in Heraldry, the flate or quality of a cadet.
Nisbet has an essay on the additional figures and marks of
cadency. See Diminution.

CADENE, in Commerce, one of the sorts of carpets
which the Europeans import from the Levant, by way of
Smyrna. They are the worst sort, and are commonly fold
by the piece from one to two shillers per carpet.

CADENET, in Geography, a town of France in the
department of Vaucluse, and chief place of a canton in the
district of Apt, near the Durance, three leagues S. of Apt.
The town contains 2951, and the canton 881 inhabitants; the
territory comprehends 260 kilometres and 9 communes.
N. lat. 43° 40'. E. long. 5° 30'.

CADENSO, or Cadenio, one of the Laccadive islands
in the Indian sea. N. lat. 11° 50'. E. long. 72° 3'.

CADENZA Spongita, in the Italian Music, is used when a part
instead of ascending or descending the proper interval, to
form a cadence, proceeds by some other interval. For in-
stance, when the bass, instead of rising a fourth or falling a
fifth, ascends only by a tone, or semitone-major.

Ex. 1.

Ex. 2.

Thus, in Ex. 1, where the bass, instead of proceeding to
C, the key-note, after G, goes to A. Thus also, in Ex. 2,
after E, the ear would naturally expect to hear A, the key-
note; but this is avoided, and F put in its place.

The interrupted and disappointed cadences in recitative
are innumerable: being governed by the dialogue; in which
a full and formal close from the chord of the fifth to the key-
ote note seldom occurs, except in the last bar of the recitation
preceding an air.

CADEQUIA, in Geography, a sea-port town of Spain
in Catalonia, 5 miles N. E. of Rosas.

CADER, a town of Asia, in the Arabian Irak, on the
Tigris: 100 miles S. of Bagdad.

CADER- IDRIS, the Chair of Idris, a lofty moun-
tain near Dolgellau in Merionethshire, North Wales, in height
the second of the principalities, is so called from a tradition
of its having been a fortress belonging to Idris, who is suppos-
ed to have been a prince of these parts in ancient times.
It is also said that Idris was a famous poet, astronomer,
and philosopher, and that the summit of Cader-Idris was his fa-
vourite seat and observatory. Mr. Rowland in his "Mona
Antiqua," (p. 84) says, that the ancients deciphered astra-
nomy by the name of Edris; a name attributed to Enoch,
whom they took to be the founder of astronomy: whence
he derives Cader-Idris; and he adds that not far off there is
another place, called "Cerrig-Brudyn," i.e. the astron-
omer's flones or circle. Accordingly the former of these
places may have been the residence, and the latter the obser-
atory of those druids in the Isle of Anglesey, who applied
particularly to the study of astronomy.

This mountain rises on the sea-shore, close upon the north-
ern side of the estuary of the small river Difwyn, about
a mile from Towy. It proceeds with almost a continual
ascent, first northwards for about 3 miles, then for 10
miles further it runs E.N.E. giving out for its summit a
branch nearly 3 miles long, in a south-westerly direction,
parallel to the main ridge. It is very steep and craggy on
every side, but the southern defcent, especially to the border
of Talyllyn lake, is the most precipitous, being nearly per-
pendicular. The breadth bears a small proportion to its
length: a line paffing along its base and intersecting the summit,
would scarcely equal 13 miles; and in the other parts it is a
mere ridge, whose base hardly ever exceeds 1 mile in breadth.
Its peak, called "Pen-y-Gader," is said by Pennant (Snow-
donia, p. 98.) to be 2850 feet above Dolgellau. Cader
Idris is the commencement of a chain of primitive moun-
tains, extending in the N. N. Easterly direction, and includ-
ing the Arrans and the Arenigs. It is much more lofty and
craggy than the flates and secundary mountains, which sur-
round
C A D

round it, and consists of siliceous porphyry, and siliceous felscholzo porphyry, both in maüs and interfeated by veins of quartz, argillaceous porphyry in mafs, and granit of Kirwan in mafs, composed of quartz and schorl. Here are found also several rocks, containing the component parts of quartz and porphyry, with fo great a proportion of white and fmoak-coloured gritty-looking quartz as alfo to conceal the other ingredients. In feveral fpecimens the felfpar, having been decompofed, has fallen out and given the quartz a porous appearance, which accounts for the porous lava laid by fome travellers to have been found here. There are no mines in Cadair-Idris, or the neighbourhood. At the foot of this mountain is a small lake, called "Llyn-y-Gader;" above the exterior ridge is another deep and clear lake, kept constantly full by the numerous tributary torrents that fall down the surrounding rocks; and at a fill higher elevation, is a fead crater, clear as glafs, and overlooked by steep cliffs fo as to recombine the crater of a volcano, accurately repre- fented in Wilfon's excellent view of Cadair-Idris. Some travellers have mentioned their having found lava and other volcanic productions here; but Mr. Aikin and his companions, who acceded this mountain, could discover nothing of this kind; nor did the water of the lake appear to differ in any refpect from the prefent rock-water, though it was repeatedly tried with the most delicate chemical tefts. A clear, loud, and diftinct echo repeats every fhot that is made near this lake. On the fummit of the mountain is a fmall plain, with two rocky heads of nearly equal height, one looking to the north, the other to the south. In the former direction Snowdon and its dependencies fhut up the fcene; on the west was feen the whole curve of the bay of Cardigan, bounded at a vaif distance by the Caermarvon mountains, and nearer, difting its white breakers against the rocky cofit of Merioneth. The fonthern horizon was bounded by Phillimmon, and on the call the eye glanced over the lake of Bala, the two Arnnig mounds, the two Arrans, the long chain of the Beryvn mounds, to the Breidyn hills on the confines of Shropshire; and dimly in the distant horizon, was beheld the Wrecin, rising alone from the plain of Salop. On the opposite fide of the mountain, by which these travellers defended, they found another beautiful mountain lake, whole cold clear waters discharge their superabundance to a full flream down the fide of the mountain. All these waters abound with trout, and in foam is found the Gwyniad, a fih peculiar to rocky alpine lakes. Following the course of the flream, they came on the edge of the craggy cliffs that overlook Talyllyn lake; and after a long and defcient defcent they arrived on the borders of Talyllyn, where they entered the Dolhghellau road. The plants which they found were lobelia dortmanni, in all the lakes, efpecially in Llyn-y-gader; fax; ifraga hypnoides; S. nivea; lycopodium telago; L. clava; fellaeca vivipara; vaccinium vitis-idea; gnaehalium di- oicum; pteris cripta; nasthectium offragum; phiginctula vulgaris; fedum rupestris; S. telephium, &c.

Beneath Tyrnaw Mawr, one of the points of Cadair-Idris, and on the right are some remains of circles of upright stones, with many cairns, and several mount-birion, of rude, upright columns. At a fmall distance beyond thefe, near the river Kroggenan, are the remains of "Llys Bradwyn," or the palace of Ednasawain, chief of one of the fifteen tribes of North Wales, about the reign of Gruffyd ap Cynan, measuring nearly 30 yards square: having an entrance 7 feet wide, with a large upright fone on each fide as a door-cafe: the walls are rude and uncemented. Aikin's Tour. Svo. 1797.

Evans's Cambrian Itinerary. Svo. 1801.

CADEOUSA, a town of France, in the country of Venafrin: 1 league W. of Orange.

Cades, in Ancient Geography. See Kadess.

CADESIA, a town of Persia, in the province of the Babylonian or Chaldæan Irak; on the verge of the Defert, 64 leagues from Bagdad, and 2 ftations, or 15 parafangs, from Cufa. It became famous among the Arabs for the defeat of the Persians, in the battle fought in the 15th year of the Negara, (A.D. 636.) under the caliphate of Omar, by Sadi, fon of Abuzrez, general of the Arabs, against Rul- tan, farmed Erokhraz, general of Jezzered, the last king of Persia, of the dynasty of Chofroes, or of the Safafiri. The army of the Moslems consisted of 50,000 men; but that of the Persians was much more numerous. The combat lasted three days, and the fervear periods of it were diffingnaed by their peculiar appellations: the first, from the fitonable appearance of Gogo of the Syriam brethren, was denominated the day of fairceur. The day of couple- foned expiated the disorder of one, or, perhaps, of both, of the contending armies. The third, a nocturnal tumult, received the whimfical name of the night of herking, from the discordant clamours which were compared to the inarticulate sounds of the firceai animals. The morning of the succeeding day determined the fate of Persia; and a feafonable whirl- wind drove a cloud of dust against the faces of the unbelievers. The clangor of arms was re-echoed to the tert of Rulfan, who was gently reeling in a cool and tranquill haze, amid the baggage of his camp, and the train of mules, that were laden with gold and silver. On the found of danger he started from his couch; but he was overtaken in his flight by a valiant Arab, who caught him by the foot, firnec off his head, hoisted it on a lance, and笺antly returning to the field of battle, carred Ruffan and defmay among the thickest ranks of the Persians. This battle has been juftly defcribed by the epithets of obfinate and atrocious; and the Saracen acknowledge a los of 7500 men. The oandard of the Persian monarchy was overthrown and captured in the field; which oandard was a leathern apron of a blacksmith, who, in ancient times, had arfen the deliverer of Persia; but this badge of heroic poverty was defignified, and almoft concealed by a profusion of precious gems. After this victory, the wealthy province of Irak, or Affyria, submitted to the caliph; and his conquets were firmly eftablibhed by the speedy foundation of Bagdor, a place which ever commands the trade and navigation of the Persians. D'Herbelot. Bib. Orient. Gibbon's Hist. vol. vi. p. 367, &c.

CADET, the younger brother of a family: a term naturlized in our language from the French.

In Paris, among the citizens, the cadets have an equal portion with the eilded; in other places the eilded has all. According to the custom of Spain, one of the cadets, in great families, takes the mother's name.

Cadet afo denotes a young gentleman-soldier, who, to attain to some knowledge in the art of war, and in expectation of preferment, chooses to carry arms as a private man, in a company of foot.

Cadet differs from volunteer, as the former takes pay, though only that of a private man, whereas the latter serves without pay.

In 1682, the king of France eftablished companies of ca- dets, wherein the young genteiy were trained up to war, and taught the arts and exercifes belonging thereto, as riding, fencing, mathematics, &c.

Cadet, Claude, in Biography, one of the physicians to Lewis IV. was born at a village near Troyes, in 1695. Applying diligently to the study of medicine and surgery, at the age of 21, he was sent to Paris, and admitted among the attending surgeons at the Hotel Dieu, where he profited so well by the opportunities which offered for information, that in 1724, he was admitted of St. Come, and attained

4 Q

retained
tained to considerable eminence in his profession. He died at Paris, Feb. 10, 1745. His only work is, "Observations for the Maladies of the French," Paris, 1744, 12mo., which was republished, two years after, with additions. His two sons, Lewis Claude, and Anthony Alexis, who were both brought up to the practice of medicine, distinguished themselves by their publications on the subjects of chemistry and pharmacy, of which the following are most known: "Analyse Chimique d'une Eau Minérale nouvellement découvrite a Paris," 1775, 12mo.; "Reponse a plusieurs Observations de M. Baumé par l'Ether Volatile, sur le Mercure precipité par le, sur le Redution de Chaux, de Caust., et d'Etain a travers les Charbons," Paris, 1775, iv., besides numerous communications to the Academy of Sciences, at Paris, and Curifol. Nat.; of both which Lewis Claude was member. Eloy, Dic. Hist.

CADEUM, a town of Ethiopia, near Egypt, Pliny. Cadge, a round frame of wood on which fowlers carry their hawks when they expose them to sale.

CAGDOLLS, in "Geography," a mountain of Scotland, in the county of Ross; 6 miles S.E. of Tain.

CADIS, among the Turks and Saracens, denotes an ordinary judge, who decides in all civil controversies within the district of a town or city, though subject to appeals to inferior judges.

The word is Arabic, كَدِيْس, q. d., judge, formed of كَدَيْس, to judge. D'Herbelot writes it cadit.

The term cadis, used absolutely, denotes the judge of a smaller town or village who judges, without appeal, all litigious affairs, not only of the Mussulmans, but even those of the Jews and Christians; those of cities being called mollas, or moulas, sometimes moudcadis, or great cadis. The place of a cadis, or of a mollas, is frequently occupied by a lieutenant, called nahi, who judges, like them, without appeal; he is a moudis, who runs the career of magistracy, and is generally appointed cadis the following year, and sent to another poit. The cadis remains in this rank, and obtain no other advancement besides that of a tribunal, more extensive, and, consequently, more lucrative. They, nevertheless, become mollas of an inferior rank; such are those of Bagdad, Philadelphia, &c.; but they cannot become cadisdelches, mutfis, &c. unless they enter the grand college of Soliman I. and continue their studies. The tribunal of justice is designated malkana, or mélême.

We find numerous complaints of the avarice, extortion, and iniquity of the Turkish cadis; all justice is here venal; the people bribe the cadis; the cadis bribe the mollas; the mollas the cadiusdelches; and the cadiusdelches the mutlis.

It is usually vain to appeal, even if an appeal were allowed, from the sentence of the cadis; since the affair is never heard, and, but judgment is passed on the case, as flattered by the cadis. The tribunal, whence these cadis judge their decisions, is sometimes at their own houses; but never at any place which corresponds with the idea annexed to so solemn an employment. In an empty mean apartment, the cadis sit on a mat or wretched carpet; and on each side of him are his clerks and some domestics. The door is open to every body; the parties appear; and there, without interpreters, advocates, or attorneys, each pleads his own cause. Squatted on the ground, they state the facts, dispute, and reply again in their turns, sometimes the debates are violent; but the cries of the clerks, and the flail of the cadis, soon restore order and silence. Gravely smoking his pipe, and twirling the end of his beard round his finger, this judge licence, interrogates, and concludes by pronouncing a sentence without appeal, which at most allows but two months delay. The parties are never very well satisfied; they retire, however, with respect, and pay a fee, estimated at one tenth of the litigated property, without murmuring at the decision, as it is invariably directed by the "infallible Koran." Venality, indeed, is so barefaced, and so impudent, that the parties may bargain for their causes with the cadis, as they would for any common commodity. Corruption is habitual and general; nor is it likely to be otherwise in circumstances, where integrity may be ruinous, and injustice lucrative, where each cadis, deciding without appeal, fears neither a revision of his sentence, nor punishment for his partiality; and where, in short, the want of clear and precise laws affords a thousand ways of avoiding the blame of an evident injustice, by opening the crooked paths of commentaries and interpretations. The cadis, nevertheless, are often calumniated, and punished for notorious injustice with the bastinado and mulets; but the law forbids them to be put to death. Conflantinople has had cadis ever since the year 1350, when Bajazet I. obliged John Palalogenus, emperor of the Greeks, to receive cadis into the city, to judge all controversies happening between the Greeks and the Turks settled there. In some countries of Africa, the cadis are also judges of religious matters. Among the Moors, cadis is the denomination of their higher order of priests, or doctors, answering to the rabbins among the Jews.

CADI, in "Ancient Geography," a town of Mylia; according to Steph. Byz.; but Strabo places it in Phrygia.

Gen. Ch. Cal. bell-shaped, five-cleft. Cor. petals five, rarely fix or feve, inverely heart-shaped, equal. Stam. filaments ten, rarely more, oval-shaped, a little curved, gibbous at their base, the length of the corolla, ranged in a circle near the petals; anthers oblong, incumbent. Pist. germ pedicelled; style simple. Peric. lemma linear, compressed, bent at the end, membranous, many-seeded. Seeds oblong, shining.

Ell. Ch. Calyx five-cleft; petals equal, inverely heart-shaped; lemma many-seeded.

CADING, a kind of lentiles in Batavia; and the adjacent country, which makes a considerable part of the food of the common people. Dr. Haworth's Account of the Voyage to the South Seas, vol. iii. p. 733.

CADIA PATAM POINT, in Geography, lies on the coast of Malabar, in the East Indies, near the extremity of the peninsula of India, to the west of Cape Comorin. Pooiytopu village is situated on the sea-coast, E. N. E. 4 geographical miles from this point. N. lat. 8° 9' 15". E. long. 77° 26' 35'.
capital officer of justice among the Turks, answering to a chief-justice among us.

The word comes from the Arabic kadi, judge, the particle ah, and ofchar, army; as being at their first institution chiefly judges of the fouldery; of whose causes they have still the sole cognizance. D’Herbelot writes the name cadilllexer, or cadilfker.

It is said that this authority was originally confined to the fouldery; but that at present it extends itself to the determination of all kinds of law suits; yet, nevertheless, subject to appeals.

At Constantinople there are two cadilefchers, who superintend the concerns of the Ottoman empire; one of Romainia, or of Turkey in Europe, and the other of Natalos, or of Turkey in Asia. They were formerly the judges of military men, the former for European Turkey, and the latter for the Asiatic countries, when the Sultan commanded them in person. The cadilefcher of Romainia was then charged to decide on the affairs of the Musalmans, and the other on those of the tributary subjects. For some time past, the former has the pre eminence over the latter, and determines alone all the causes carried to his tribunal, by the sole will and at the request of the plaintiffs. The tribunal of the cadilefcher of Natalos has been a long time superseded as useless. They both aspire at the divan of the grand vizir, bear and defend the causes brought before them; after which the cadilefcher of Romainia alone pronounces the sentence.

The mufti presides annually a lift to the fultan for the nomination of two cadilefchers, of the Stambol effendi, of the mollas of Mecca and of Medina, of those of Bura, Adrianople, Cairo, and Damaticus, as well as of those of Jerusalem, Aleppo, Smyrna, Larifla, Salonica, Scutari, Galata, and Ajiup, which is one of the suburbs of Constantinople. It is commonly according to the rank of seniority that the choice is made, when favour does not advance some protected person, or the son of some great man. When chosen, the cadilefchers remain in place only a year; but the cadilefcher of Natalos generally succeeds that of Romainia, and the former has before passed through the same rank. To them it belongs to appoint all the simple cadis of the empire; and this circumstance renders their place, in a country where every thing is vend, very lucrative, independently of the appanages which they possess. The cadilefcher of Romainia appoints the cadis of Turkey in Europe, and that of Natalos appoints those of Asia and Egypt. Subordinate to them is the Stambol-effendi, molla, or judge of the capital. See Stambol-effendi. The cadilefchers are sometinnes advanced to the rank of mufti (which see); but according to the established order, he must be chosen from among the cadilefchers of Romainia, and those who have occupied that employment. Those who aspire to the office of cadilefcher must pass through a previous course of education. For this purpose there are attached to the imperial mosques of Constantinople, Bura, and Adrianople, mafters, or colleges, to which young persons are sent, from all parts of the empire, to be instructed in the law of the prophet. In religious, civil, and criminal jurisprudence, and to learn all the opinions and all the subtileties of the commentators on the Koran. They then undergo various examinations, and when they are thought to be well informed, the rank of mufters or professor is affigned to them. These colleges were founded by different sultans. The first was established at Nicea, in the year 1375, by Orkhan. They enjoy a considerable revenue, and provide for the support of 2 or 3 thousand felbaras.

The mufters, who are not willing to follow the career of professor and obtain the eminence rank of molla, solicit of the cadilefchers the place of cadis, which is easily granted them for a pecuniary consideration. The mufters, who are ambitious of obtaining the most important places, such as those of molla, cadilefcher, and multi. pas, after fresh examinations, to the mofque of Solomon I. and wait till their turn, their merit, or their interest procures them an appointment.

Eight of them, under the appellation of makkerche, are appointed every year mollas, or judges, of the towns of Jerusalem, Aleppo, Smyrna, Larifla, Salonica, Scutari, Galata, and Ajiup. Four, among the latter, are afterwards named to the cities of Bura, Adrianople, Cairo, and Damaticus, and the following year two of these become mollas of Mecca and of Medina; from among these last is taken the Stambol-effendi. Thus, successively in their turn, they arrive at the place of cadilefcher, and even of multi. But the mufters, before they can attain to this distinction, must either be protected, or manifest ardent zeal for religion, distinguished talents, great application to study, and very auffere manners. The mollas, cadilefchers, and others who are not employed, and who are waiting for offices, have appanages or benefits, called “Arpalkis.” Several obtain inferior tribunals, where they place names, who discharge their functions, and to whom they grant only a part of the income.

Tournefort (Voyage Lev. tom. ii. lett. 14.) erroneously afferts, that, at Confantinople, a perfon could appeal from the sentence of a cadis; whereas Europeans only enjoy that privilege, when the sum in litigation exceeds 4000 francs, or nearly the value of 66 lives, supposing the pilafre at two lives. In all the towns of Turkey, the molla, the cadis, and the moh, judge without appeal; they condemn to fines, to corporal punishment, or to death, without allowing to the delinquent, or perfon accused, the power of having recourse to another tribunal. Pococyte, Egypt, p. 170. Volney’s Travels in Egypt and Syria, vol. ii. p. 389, &c. Olivier’s Travels in the Ottoman Empire, &c. p. 174, &c.

CADILLAC, or CADILHAC, in Geography, a town of France, in the department of the Gironde, and chief place of a canton in the district of Bordeaux, seated on the banks of the Garonne, and containing a fine castle, with a collegiate church; f ½ leagues S. S. E. of Bordeaux. The place contains 1526, and the canton 12,205, inhabitants; and the terriory includes 97 ½ kilometres and 16 communes. N. lat. 44° 37’. W. long. 0° 15’.

CADITIS, an appellation given by Plaut to a kind of figured stone, resembling a cadis or barrel.

The cadites sells in the middle, and goes tapering to both ends, being divided lengthwise, with such equidistant linements, as are usually made by the flaves of a barrel, but without hoops, nor yet hollow.

CADIZ, in Geography, called Gades by the Romans, by the Phænicians Gadir or Gadair, i.e. a hedge or fenced place, and by some of the ancients Tarfus; a sea-port city of Spain, seated on a promontory in the extremity of a peninsula, and joined to the isle of Leon by a causeway. Towards the east it is washed by the gentle waves of a well-protected road; but towards the west it is open and exposed to the fury of the ocean. Both the harbour and bay of Cadiz are secure and spacious; the entrance being defended by fort Matargordo, and by fort Puntal flanding opposite to it on a point of that neck of land on which Cadiz is built. The entrance into the harbour is between these forts and the points on which they stand, is reckoned to be about 500 fathoms wide. During the time of ebb, a considerable part of the harbour is dry. The outer and furthermost bay, which begins between La Rota and San Sebastian, both of which are fortified, and extends to Puerto de Santa Maria, is divided into two parts by the rocks of Los Pueros and Diamante. On the south side Cadiz is inaccessible on ac-
count of the high and steep shore; on the north side also the access is dangerous, by reason of many sand-banks and rocks which lie under the water; and though the south-west side admits of landing, it is defended by fort Santa Catalina, or St. Catherine. On the S.S.W. point is a ridge of rocks, part of which, at full sea, is covered with water; the outermost of these is a small island, on which are a guard and light-house, with two chapels, and also fort San Sebastian. The city, therefore, is susceptible of attack only at the narrowest part of the neck of land lying between it and the S. E. part of the island of Leon; and on this side it is also fortified.

The belt view of Cadiz and its environs is that which may be had from the signal tower; and hence you look immediately down upon the houses, whole flat roofs, covered with a white cement, exhibit a singular but very pleasing appearance. Towards the west, you command the ocean, with numerous vessels, leaving or entering the harbour; and on the land side, you discover the four interesting sea-port towns of Rota, Santa Maria, Puerto Real, and Caraca, with the Isle of Leon, and the connecting causeway; whilst a rich country, verging towards the setting sun, bounds the distant prospect. The streets of Cadiz are narrow, and yet well-paved and clean. The most beautiful part of the city looks towards the Puerto de Santa Maria, where the houses are lofty, built of white freestone, brought from thence across the bay, and ornamented with painted balconies. In front they afford a wide parade, well gravelled, planted with trees, and communicating with the sea-road, where the merchantmen and ships of war find shelter. Two considerable squares, one for the market, the other called Plaza de San Antonio, with the Calle-cancha, or Broad-street, joining to it by way of mall, contribute both to ornament and health; and as the whole city is nearly encompassed by a rampart, this forms an elevated, airy, and delightful promenade, much frequented in the evenings. A small part towards the west is bordered by five rows of elms, forming four avenues, adorned with elegant seats, and constituting the Alameda. Along the ramparts is also a row of houses; and the shaded parts towards the south serve for the lower classes to take their siesta, and enjoy the luxury of the sea-breeze. The inhabitants of Cadiz supply the want of other promenades by parties of pleasure in the environs of the city. With this view they go out in carriages either to Puerto de Santa Maria, where are fine avenues and gardens, or to Chielana, near the Isle of Leon, which is almost entirely covered with country houses, and commands a very fine view of the bay, the town, and the sea. Although the extent of Cadiz is very limited, yet its houses are crowded together, and are very lofty, so that the population is estimated at between 75,000 and 80,000. (Fischer's Travels in Spain.) Townsend (Journey through Spain, in 1785 and 1787), reckons them at no more than 65,000; but he says, that about 10 years since, they were computed at 85,000, besides about 20,000 people who entered daily from the sea and from the adjacent country. The most distinguished buildings are the two cathedrals, the ancient and the new; the former is chiefly remarkable for some good pictures, and for its treasures, consisting of gems, silver candlesticks, and lamps, numerous and bulky; three ciboriums, one of which, constructed of the finest silver, weighs 51 arrobas, or more than half a ton; and another consists mostly of solid gold. The new cathedral is a huge pile, with large and lofty domes, and many well-proportioned pillars; but upon the whole heavy and disgusting. Near the cathedral is the Placa de Toros, appropriated to the bull-fights, built entirely of wood. At a small distance are the observatory, all provided with instruments, and the academy for painting, sculpture, and architecture. In the convents are some few good pictures. Of the three hospitals, one, called the Royal or Military Hospital, is designed for soldiers, and accommodates 80 students, who are maintained and educated at the king's expense. It has a good botanical garden, and a theatre for performances, furnished with subjects from among the patients. The other two, one for men, and the other for women, are distinguished for their neatness. Besides these hospitals for the sick, Cadiz has a retreat for 47 widows, founded by a Turkish merchant, who died in 1756. But the most interesting establishment in this city, and the most conducted of its kind in Spain, is the hospicio, or general workhouse. It accommodates (at an average of the year 1787) 855 paupers of every nation, age, and sex; who are either paid labour, or instructed and employed in useful arts; and encouraged in proportion to the amount of their labour.

The heat of the climate at Cadiz is moderated by the sea-breeze; so that even in summer it enjoys a happy temperature, and few places are more healthy; but it becomes more intense whenever the solano or south-east wind prevails. This paffes to them over the scorching plains of Africa; and fuch is its effect, that all the pallerios are inflamed, and during its prevalence, the inhabitants, who are most irritable, commit every species of excess.

This city abounds with almost all the necessaries and luxuries of life. Its fruits are cheap, and its most remarkable wines are sherry and pacaretti, both of which are procured from Xeres and its vicinity. But they are much diluted for want of fresh water, which they are obliged to fetch from Puerto de Santa Maria; and their ice, which is used for cooling it, is brought from Sierra, at the distance of 13 leagues. For domestic purposes, such as washing, &c. they collect their water in subterraneous cisterns, but being subject to little by evaporation, it is procured with difficulty, and consumed with great economy. For preventing a scarcity of corn, and in order to ensure a profit by the sale of it, the city has established a public granary, from which the bakers are supplied at a given price; and, according to that, the magistrates regulate the affluence of bread. The theatre at Cadiz is large, elegant, and commodious; the principal actors are Italians; and the inhabitants are chiefly attracted to it by the comedies called Saynetes, and the whimsical dances denominated Voleros. In Lent, whilst the most polished orators confine themselves to churches, other preachers harangue the multitude in the market-place, with a vehemence of voice and gesture suited to their congregations. Among the Franciscans, when the penitential sermon is finished, the lights are extinguished, and instantly scourges are applied. When the market-place is not occupied by orators, the orators take possession of it with their benches, at which they sit with pen, ink, and paper, to write and read letters of all sorts, and to execute every kind of deed. In the year 1720, the commerce, which for two centuries had proved a source of wealth to Seville, was transferred to Cadiz; and from that period its merchants have carried on a very considerable trade, which, however, has ebbed and flowed, according to medieval circumstances. Indeed, this port has been the emporium of commerce to the West Indies and America. Townsend informs us, that its whole trade employs about one thousand vessels, of which nearly one-tenth is Spanish. In 1784 the value of exports to America amounted, in Spanish and foreign produce, to 3,621,443 pounds sterling; and the value of imports in money and jewels was 8,297,195 claviles, and in merchandise 3,090,771. The articles of commerce are cochineal, indigo, cacao, sugar, hides, Vicuna wool, cotton, copper, tin, tobacco, different kinds of wood, &c. which are distributed...
distribute into different countries. Among the foreign merchants of all nations are many Germans, from Hamburg, Bohemia, and Augsburg. The former constitute the class called Hanseatics, and according to ancient convention enjoy considerable privileges. To foreigners indeed Cadiz is much indebted for various means of literary intercourse and improvement, as well as for the wealth resulting from an extended commerce. The manufacturers of Cadiz are principally restricted to ribbons and linens; and several parts are employed in knotting silk, and marking rockings received from Nilanes, and intended to be shipped for the American settlements. The most interesting branch of industry in the environs of Cadiz is the manufacture of salt; produced by the numerous salt-pools of the isle of Leon, with little labour or expense, because the sun and air quickly cauæ the water to evaporate, and leave the salt crystallized. Cadiz is the birth of a bithnian, Safavide of Seville.

The old Cadiz was built by the Tyrani; from thence it was transferred to the Carthaginians; and afterwards it fell under the dominion of the Romans. It was recovered from the Moors in 1266. In 1536 Cadiz was taken and plundered by the English; and an unsuccessful attempt was again made for sieging it in 1701. During the late and present war it has been held by the English, at different periods, in a state of blockade. In some of the old Spanish chronicles, this city is denominated Callis, and hence English seamen usually call it Cadiz. The tide runs here N.E. and S.W.; and it is high water at spring tides at half past four o'clock. N. lat. 36° 31' 7". W. long. 6° 1' 50".

Cadiz, a town on the north coast of the island of Cuba, in a bay of the same name, about 156 miles E. of Havana, and 50 N. of Spiritu Santo. N. lat. 23° 2'. W. long. 79° 55'. A river of this name runs into the sea, 10 miles E. from the town of Cadiz.

CADIZADELITES, a folk among the Mussulmen, resembling the ancient Scyths, who avoid all feasting and drunkenness, and affect an uncommon gravity in all they do or say. Those of them who inhabit the frontiers of Hungary, &c. agree in many things with the Chirifians, and drink wine even in the fall of the Ramyan.

They read the Balrovic translation of the Bible, as well as the Alcoran. Mahomet, according to them, is the Holy Ghost, which descended on the apostles at the fall of Pentecost.

CADLOCKS, in Botany. See SINAPSIS.

CADMA, in Entomology, a species of Papilio found in America. The wings are indented, falvous; disk of the posterior pair beneath white, with two ocellated spots, the pupil of which is double and blue. Drury, &c.

CADMA, in Rural Economy, a term applied to the smallest of the pigs which a sow has at one farrowing, and which is commonly much less than any of the others in the same litter.

CADMEAN Letters, the ancient Greek or Ionic characters, such as they were first brought by Cadmus from Phoenicia: whence Herodotus also calls them Phenician letters. See CADMUS.

According to some writers, Cadmus was not the inventor nor even the importer of Greek letters, but only the modeler and reformer thereof; and it was hence they acquired the appellation Phenoean, or Phenician letters; whereas before that time they had been called Pelasgian letters. See LETTERS AND WRITING.

CADMIA, in Chemistry. This term is entirely obsolete; as, however, it is of frequent occurrence in the writings of the older chemists, it may be proper to explain its meaning. Cadmia, according to Pliny, (Hist. Nat. lib. xxxiv. ch. xxii.) was the common name given to that earthy substance which was employed by the Cyprian artificers in the manufacture of brass; hence it is plain that it contained zinc, and was probably no other than the calamine of the moderns. The same word is also applied by the above-mentioned author to the metallic foot or ashes which collected in the chimneys of the brass foundries. It was an article of considerable use in the Roman pharmacopoea, and three varieties of it were distinguished by separate names: that called Cuprosas resembled ashes, was the lightest and most elenated, and was deposited at the first extent of the chimney; the second kind, named Botritis, depended in clusters from the central and lower part of the chimney, and was in high esteem for dyers; and the third variety, called Pleuritis, was a metallic scoria adhering to the sides of the furnace, and was used for wounds and cutaneous eruptions; its colour was either blue, or black, and, no doubt, contained a considerable quantity of copper.

Succeeding chemists injudiciously ranked as fessd cadmia not only calamine, but the arseneal and histmeric cobalt ore, and under the term Cadmia formum included all the kinds of metallic submutes that are deposited in the chimneys of fouding houses, whether of copper, brass, lead, tin, &c.

CDMUS, q. a. man from the cflfj, in fabulous History, is reported to be a native of Sidon in Phoenicia, son of Ageor, king of that country, and brother of Europa. Having been sent by his father's order in quest of his father Europa, who had been transported by Jupiter to the isle of Crete, and being forbidden to return without her, he wandered for a long time to little purpose, and, at length, despairing of success, he settled at Tanagra upon the river Ilium in the Grecian province of Boccia. He afterwards built Thebes, and laid the foundation of his new kingdom. The state, however, was, that the walls of the city were raised by the harmony of Amphion's lyre, and that he only erected a citadel to which was given his own name, and merely laid the foundation of Thebes. When the city was finished, he married Hermione, or Harmonia, the daughter of Mars and Venus; and his nuptials were graced with the presence of all the gods and goddesses. Juno excepted, each of whom conferred some gift upon the bride. His kingdom is said to have been very flourishing, and in the progress of his reign he was much beloved and respected by his subjects; though the anger of Juno, who envied his felicity, occasioned many misfortunes, which harassed and grieved him before its termination. By his wife Harmonia, he had a son named Polydorus, who succeeded him in the sovereignty of Thebes, by whom it was transferred to his son Labdacus, the father of Laus, to whom it descended, and who was the husband of Jocasta, the mother of Euseius. He had also four daughters, viz. Ino, who threw herself into the sea together with her children; Agave, whose son Pentheus was torn in pieces by the Baccantes, for profaning the rites of Bacchus; Autono, the mother of Adonis; and Semele, the mother of Bacchus by Jupiter, who afterwards slew her with his thunderbolt. After having experienced many differing vicissitudes, Cadmus is said to have retired with his wife Harmonia to the coast of Ilyria, where they were both changed into serpents, or as some interpret the fable, where they degenerated from their pristine civility into baboons. The fable also reports, that he fought with a mighty dragon, whose teeth he afterwards fired on the ground, and from them was produced an army of men, who fought against one another, till they were all killed except five: whence a dearly-bought victory obtained the appellation of 'Victoria Cadmea.' Some say that he
he was driven from the throne of Thebes by his grandson Pentheus; and that having commanded the Enchelus, who was at war with the Illyrians, he subdued the latter, and thenceforward the government to his son Hylas, who was born after his retreat to this country. To Cadmus, Greece is supposed to have derived its alphabet for the first introduction of letters, which are said to have been of Phoenician origin, and that at the time when their alphabet was first used, was, and are, the source of all the alphabets of the Greeks. Great and small letters were afterwards added by Callimachus, and four by Simonides. He is also said to have been the first who established schools, and who taught the Greeks trade and navigation; and the epitaph Cadmean, given to him, is ascribed to him, because he was the inventor of it, and because he first introduced the use of it into those parts. Wherever he came he also introduced the religion of his country, which conflicted in the worship of Dionysus, and in the rites denominated by the later Greeks the Dionysiac. They seem to have been much the same with the Cabiric mysteries, which Cadmus is said to have established in Samothrace. The arrival of Cadmus in Greece is placed by Dr. Blair about 1493 years B.C. and his death, at the age of 112 years, is said to have happened in the year 1432 B.C. The arrival of Cadmus, and the foundation of Thebes, are dated in the Arundelian marble the 64th year of the Attic era, 1519 B.C. But Sir Isæus Newton, and those who adopt his chronology, allow Cadmus to have flourished but 1035 years before the Christian era. Sir Isæus imagines, that the emigration of the Phoenicians and Syrians was occasioned by the contests of David. "These people," says he, (Chron. p. 1.) "fleeing from Zidon and from David, came, under the conduct of Cadmus, and other captains, into Apha Minor, Crete, Greece, and Libya, and introduced letters, music, poetry, metals, and their fabrication, and other arts, sciences, and customs of the Phoenicians. This happened about 1400 years before the Trojan war. It was about the 16th year of David's reign that Cadmus fled from Zidon. At his first coming into Greece, he failed to Rhodes, and thence to Samothrace, an island near Thrace, on the north side of Lemnos, and there married Harmonia, the sister of Japhus and Dardanus, which gave occasion to the Samothracian mysteries." Bechart has, with great ingenuity and learning, attempted to solve the enigmas, under which the history of Cadmus is represented. He supposes, that Cadmus was a fugitive Cannaite, who fled from the face of Jophua; and that he was so called from being a Cadmonite, which is a family mentioned by Moses. Gen. xxv. 9. These Cadmonites were the same with the Hivites, and were called Cadmonian, or Eilcrings, because they inhabited mount Hermon, the most eastern part of Canaan; and Bechart supposes, that Harmonia derived her name from that of this mountain. The fable of Cadmus and Harmonia being transformed into serpents he ascribes to their having retained the common name of Hivites, which in the Syriac signifies serpents. He explains the rise of the fable, concerning the teeth of the dragon, which were fowl, and the armed men which arose from them, upon the same principle. The learned Bryant (Anal. Anc. Mythol. vol. ii. 158) differs from Bechart in a variety of particulars. Indeed, he controverts the existence of such a person as Cadmus, and fuggles several objections against the account given by Herodotus and others of the Cadmins having brought letters from Phoenicia into Greece. See Letters. The rites of Bacchus, he says, could not have been brought by Cadmus into Greece, if Bacchus was his descendant, or the son of his daughter Semele. It is said, that Cadmus was a Phoenician; but Diodorus Siculus (ib. i. p. 20.) speaks of him as an Egyptian, and a native of Thebaia. Phercides Syrus also represents him as an Egyptian; and by others he is said to have been the son of Antiope, the daughter of Belus, and consequently of Babylonian extraction. It was from the same part of the world that the mysteries in which Cadmus was so well skilful, were imported; and here it was, that he was taught hieroglyphics, and the other characters, which are ascribed to him. These arts he carried first to the coast of Sidon and Syria; and thence he is supposed to have brought them into Greece. Mr. Bryant having stated the origin and country of Cadmus, proceeds to show what the accounts which are given of him by Herodotus, Diodorus, Strabo, and Pausanias, are insufficient to prove the reality of such an adventurer. It is not credible, he says, that a person should so often rove upon the seas amid such a variety of nations, and reside among them at his pleasure; much less that he should build temples, found cities, and introduce his religion wherever he lifted; and that he should do all this in the course of his transient visits to different places. Is it credible, that any person could have penetrated into the various regions, whether he is supposed to have gone? to have founded colonies in Phoenicia, Cyprus, Rhodes, Thera, Thasus, Anaphe, Samothrace, to have twice visited the Hellepont? to have worked the mines in the Pangean mountains, and in other places? to have made settlements in Euboea, Attica, Bœotia, and Illyria? and, above all, to have had such territories in Africa? He is represented as heir to the kingdom of Egypt: this he quitted, and obtained a kingdom in Phoenicia. He leaves this too; and after much wandering arriving in Greece; where he founds several cities, and reigns 63 years. After this, hard to conceive: he is made king in Illyria. He must also have reigned in Africa, and his dominions seem to have been considerable, as he founded an hundred cities. He is represented as a king in Armenia; and had there too small territory. Sure, kingdoms in those times must have been very cheap, if they were so easily attainable. But the whole is certainly a mistake: at least, in respect to Cadmus. No person could possibly have effected what is ascribed to him. They were not the achievements of one person, nor of one age. And place Cadmus at any given era, and arrange his history, as may appear most plausible; yet there will arise numberless inconveniences from the connexions he must have in respect to time, place, and people; such as no art nor disposition can remedy." Should it be asked, if there were no such man as Cadmus, what did the ancients allude to under this character, and what is the true purport of these histories? The answer of Bryant is, that the travels of Cadmus, like the expeditions of Periclus, Scolopers, and Oliris, relate to colonies, which at different times went abroad, and were distinguished by this title. Cadmus, he says, was one of the names of Oliris, the chief deity of Egypt. Both Europa and Harmonia are of the like nature. They were titles of the deity, but assumed by colonies, who went out and settled under these denominations. Cadmus was one of those deities. He was the same as Hermes of Egypt, called also Toth, Athoth, and Canathoth; and was supposed to have been the inventor of letters. He was sometimes called Cadmus, another name for Hermes; under which he was worshipped in Samothrace and Hellen. Lycurgus (v. 219.) speaking of the prophet Præclus in Libya, tells us, that he was the son of Cadmus, and of the race of Atlas. And he was the person who was supposed to give information to the Greeks, when they were upon their expedition to Troy. Harmonia, the wife of Cadmus, who has been esteemed a mere woman, seems to have been an emolument of nature, and the following nurse...
CADD

CADOEPAN, in Geography, an island in the Indian Ocean, S.E. of Boston, and near the islands of St. Matthew and Toureau-Delhis, in which many cloves are produced.

CADOGAN, William, in Biography, educated at Oriel College, Oxford, took his degree of master of arts in 1755; and the same year was made bachelor and doctor in medicine. He had previously, viz. in 1750, published a small treatise on the nursing and management of children, which was much esteemed, and contributed toward abolishing some improper treatment, both in feeding and dressing infants. They were first adopted by the managers of the Foundling Hospital, and by degrees became general. His next publication was "Differtations on the Gout, and all Chronical Diseases," 1764, 8vo., written in a popular manner, and to generally read, that several large impressions were fold of it. The three principal causes or sources of gout, he says, are indolence, vexation, and intemperance.

The book was much cavilled at, and was answered by two or three different writers. It is, on the whole, well written, and the regulations given for the conduct of gouty patients, with the view of mitigating the fit, and preventing frequent relapses, or returns of the complaint, are judicious, and well deserving attention. He was fellow of the college of physicians, and, which is by no means usual, spoke two Harveian Orations, the one in the year 1764, the other in 1793. They were both published. He died at a very advanced age, at his house in George-street, Hanover-square, April 26, 1797.

CADOINA, in Geography, a town of Naples, and province of Principato Ultra; 15 miles N.N.E. of Conza.

CADOLZBURG, a town of Germany, and prefecture of the same name, in the circle of Franconia, and gravissate of Anspach; the town is surrounded with walls, and defended by a cattle; 18 miles N.E. of Anspach.

CADORE, or Pieve di Cadore, a town of Italy in the Trevisian, and capital of the Cadore, or Cadorn, belonging to the states of Venice, and famous for the birth of Titian the painter; 42 miles N.E. of Trent. N. lat. 46° 25'; E. long. 13° 45' 30".

CADORE, or CADORIN, a small and mountainous district of the Trevisian, or Trevigiana, belonging to Venice; bounded on the north by the bishopric of Brixen; on the east by Friuli; on the south by the Bellunese; and on the west by the Bellunese and bishopric of Brixen; about 25 miles long, and from 10 to 15 broad.

CADOUIN, a town of France, in the department of Dordogne, and chief place of a canton, in the district of Bergerac. The place contains 623, and the canton 5833 inhabitants; and the territory includes 1521 kilometres, and 12 communes.

CADOURS, a town of France, in the department of the Upper Garon and district of Toulouse. The town contains 826, and the canton 6562 inhabitants; the territorial extent comprehends 1724 kilometres, and 17 communes.

CADRITES, a kind of religious among the Mahometans; whose founder was Abdul Cadiri, a great philosopher and lawyer; whence they take their name, Cadrites.

They live in common, and in a kind of monasteries, which, however, they are allowed to quit, if they request it, and to marry, on condition of their wearing black buttons on their garments to distinguish them from the rest of the people.

In their monasteries, they pass the greater part of every Friday night in running round, holding each other's hand, and

nurse of all things. Harmonia was supposed to have been a personage, from whom all knowledge was derived. Accordingly, Hermon, or Harmonia, was a deity to whom the first writing is ascribed; and the fame is that of Hermes. Cadmus is said not only to have brought letters into Greece, but to have been the inventor of them; from whence we may fairly conclude, that under the character of Hermon, Hermes, Taut, Thoth, and Cadmus, one person is alluded to. The deity called by the Greeks Harmonia, was introduced among the Canaanites very early by people from Egypt; and was worshipped in Sidon, and the adjacent country by the name of Bilal-Hermoe. Europa was likewise a deity; the same, according to Lucian, as Albarte, who was worshipped at Hierapolis in Syria. Cadmus, says Paul, may principally be esteemed Ham, who by his pottency was looked up to as the sun, and worshipped under his titles; a circumstant, which was common to all, who were filled of Balsam. His name favours this conjecture; for according to the etymological fyllem of this writer, the sun was called Ached, and Cadmus is a compound of Ached, Ham, rendered by the Greeks Academus and Academus, and contracted Cademus. Upon the whole, if instead of one person Cadmus, travelling much ground, and introducing the rites of his country, Rhodes, Samos, Thera, Thasus, Samothrace, and building to many cities in Libya, we supposethe things to have been done by colonies, who were filled Cadmians; all will be very right, and the credibility of the history not disturbed. Many difficulties will be solved; and great light will be thrown upon the mythology of the ancients. The story then of Cadmus and Europa relates to people from Egypt and Syria, who were abroad at different times, and settled in various parts. They are said to have been determined in their place of residence by an ox or cow; which denotes that they were directed by an oracle; and this leads us to the Egyptian Apis. The Cadmeans, according to Cadry, were a two-fold colony, which came both from Egypt and Syria; from Egypt first, and then from Syria and Cadmus. In their progress wellward, they settled in Cyprus, Rhodes, Samos, Lesbos, and Thrace; also in Euboea, Attica, and Beotia. In process of time they formed settlements in other parts, particularly in Epirus and Illyria; and occupied some considerable provinces in Italy, as high up as the Pudus. Wherever they passed or settled, they left behind them a variety of memorials; and especially such as related to their rites and worship. See CUTFERS.

CADMUS MILESUS, in Biography, an ancient historian, who, according to Moreri, lived about the time of the Trojan war. Phiny, in speaking of the invention of things, informs us, (ib. vii. c. 56,) that Pherecydes, a native of Syros, taught the composition of difcorump in prose, during the reign of Cyrus, and Cadmus Milesius to write history; and in another place (ib. vi. c. 29,) he says, that Cadmus Milesius was the first who wrote in prose. He composed, "The Antiquities of Milesus and of all Ionion," in 4 books: a work on this subject, mentioned by Dionysius of Halicarnassus, and attributed to this historian, was thought by the best judges, as he informs us, to have been superseded.

Another Cadmus, also a Milesian, was, according, to Suidas, much younger than the former; and wrote "The History of Attica." in 10 books.

CADNUS, in Entomology, the name under which Cramer figures the Brazilian species of Papilio, called by Fabricius Acheronta. The wings of this insect are indented, and furnished with tails; anterior pair red at the base, the tip black spotted with white. Fabr.
and crying incessantly. Ual, Epubi, one of the names of 
Cea; one of the number plays all the time on a flute, to 
animate them in this extravagant dance.

Cadsand, in Geography, an island on the coast of 
Dutch Flanders, at the mouth of the Scheldt, situated on 
the south side of the entrance into the West Scheldt oppo-
site to Flushing, so as to command the navigation of that 
river. It is preferred by elevated dykes constructed at great 
expense, from the inundations of the sea; and, nevertheless, 
exposed to danger, when the north-west wind blows with 
violeuce. The land is fertile, and yields excellent corn; 
the meadows are luxuriant, and the farmers make a 
considerable quantity of good cheese. The persecuted French 
and Saltzburgers found an asylum in this island. The 
chief town is Caflandria.

Caduceator, in Antiquity, a denomination given to 
heralds or messengers of peace. See Caducus.

Caducus, or Caducum, Mercury's rod or sceptre; 
a wand entwined with two serpents, worn by that deity 
as the ensign of his quality and office: and given to him, 
according to the fable, by Apollo, for his seven-strunged 
harp.

The poets attribute wondrous virtues to the caduceus: 
as that of throwing people into a sleep, raising the dead, 
&c. It was also used by the ancients as a symbol of peace 
and concord; the Romans sent the Carthaginians a javelin, 
and a caduceus, offering them their choice, of whether of 
war or peace.

Among those people, those that denounced war were 
called secundatos, and those who went to demand peace, 
caducatores; because they bore a caduceus in their hand.

The caduceus found on medals is a common symbol sig-
ifying good conduct, peace, and prosperity. The rod 
expresses power, the two serpents prudence, and the two 
wings diligence.

Wedelins has given a dissertation expressly on caducated 
medals. Bonniger in his "Griechische Vafengemahle, 
&c." or "Greekian Paintings on Vases" illustrated (vol. i. 
p. 2). Weimar, 1708, has faggelled some new and ingen-
nious ideas with respect to the origin of the caduceus. 
According to this writer, the deity called Hermes by the 
Greeks, and Mercury by the Romans, owed his imaginary 
existence entirely to the commercial intercourse of the Phr-
icians with the Greeks. At some remote period, the 
former had mines and factories in many places of Greece. 
There Hermes was worshipped as the tutelary deity of the 
industrious Phoenicians and all the arts, by which the arti-
cles of trade are produced, were ascribed by the Greeks to 
his invention. The Phoenicians, of course, in order to con-
verse with the rude natives, employed interpreters. Hence 
Hermes was considered as the inventor of articulate sounds, 
and of numeral figures and signs. The interpreters and he-
rals were called his sons, and the race of xépsi is said to 
have defended from him. The Phoenician traders, where-
ver they first approached the rude Peloponese inhabitants of 
the Grecian coasts, found it necessary to use some manifest 
token of their having arrived with peaceful intentions; not 
as pirates, but as merchants and barterers. In such in-
stances, the most natural sign of peace among all nations, 
even among the inhabitants of the Friendly Islands in the 
South Seas, has ever been a green branch. The Pheni-
cians, however, soon found it more convenient, as well as 
more ornamental, to carry with them a decorticated or 
even a girt staff; and, as occasion required, to wind round 
it green leaves. Such is the wand of Mercury in Homer. 
(Hymn. in Mercur. 529—532.)

Cæc

Caducus is also a name given to a kind of staff cov-
Cæc
ered with velvet, and decorated with fleurs de lys, which the 
French heralds of arms bear in their hands on solemn oc-
Cæc
tasions. That borne by the king at arms has a golden fleur de 
Cæc
ty at the end, and is by some called feught.

Caducus, in Botany, a term employed to express 
Cæc
the short duration of one part of a plant compared with an-
Cæc
other: thus, a caduceus calyx falls off before the petals, as 
in poppy and celandine; a caduceus corolla falls off imme-
Cæc
diately after its expansion, and before the anthers have 
Cæc
formed their pollen, as in aeschines and thalictrum. A flupus is 
Cæc
caducous, when it falls off before the leaf; and a breack, 
Cæc
when it does not continue as long as the flower. A leaf is also 
Cæc
said to be caducous, when it does not remain till the end of 
Cæc
the summer. It always implies a shorter duration than is 
Cæc
intended by the term deciduous.

Caducus Morbus, or Falling Sickness, in Med-
Cæc
icine. See Epilepsy.

Caducci, in Ancient Geography, a people of Gaul, 
Cæc
who inhabited the town of Divonia. Ptolemy. They are 
Cæc
mentioned by Cæsar, Strabo, and Pliny. Their territory 
Cæc
is the present Quercy, the capital of which is Cahors.

Cadus, an ancient liquid measure of capacity, contain-
Cæc
ing ten, sometimes twelve, composing sixty, and fifty, or on-
Cæc
to others, twenty-two deciliters.

The cadus is the name with what is otherwise denominat-
Cæc
ed stamates and ceraum. See Amphora.

Cadusia, in Ancient Geography, a country of Asia, 
Cæc
being part of Atropatene, according to Strabo.

Cadusis, or Cadusians, a people who inhabited the 
district lying to the south of Babylon, between the Tigris 
and the Euphrates. They were a powerful people, and 
enemies of the Assyrians; and their alliance was fought by 
Cyrus, in his war against the king of Assyria.

Cadyna, or Cadoria, a town of Acha Minor, in the 
Cæc
mountains of Lycaonia, according to Strabo.

Cadytis, a town of Acha in Syria, mentioned by He-
Cæc
rodorus, and supposed to have been Gath. As it was near 
the sea, it could not have been Jerusalem, as M. 
D'Anville conjectures. Others have supposed it to have 
been the Ceduia of Josephus, and others refer it to 
Gaza.

Cæca, in Icthyology, a species of Muraena, aperea-
Cæc
gious; with the fin somewhat acute. Found in the Me-
Cæc
diterranean Sea.

Cæca, in Zoology, a species of Nais, with lateral feto-
Cæc
wars, and without eyes. Found in the bays of Iceland and 
Cæca
Christianland, in Norway.

Cæca, a species of Nereis, sub-convex, with two very 
tentacules, and the lamella of the pedunculi duplicate 
ciliate. Fabr.

Cæcæl Gladiæ. See Glandes.

Cæcia, in Ancient Geography, the name of two il-
Cæca
les, which Pliny places in the vicinity of the Spirean pror-
Cæca
monty.

Cæcilia, in Entomology, an African insect of the Pa-
Cæca
pilus genus, the wings of which are white in the middle, 
with black dots; posterior ones margined with black, dotted 
beneath with white. Fabr.

Cæcilia is also a synonymous name of Papilio Am-
Cæca
ynctor of Fabricius, in the works of Cramer.

Cæcilia, in Ichthyology, among old writers, the 5th de-
Cæca
nominated by modern naturalists Syngnathus acus.

Cæcilia, in Zoology, a genus of serpents distinguished 
by having wrinkles on the body and tail, and two tentacula 
on the upper lip.

There
There are only two species of this genus at present known, namely <i>tantascuta</i> and <i>glutinosa</i>.

<i>Cælia</i>, the general name under which several creatures have been described by old writers, is commonly called Cælia major by them; Anguis fragilis of the Linnaean <i>Fa. Suec.</i> is named by different writers Cælia vulgaris, Cælia Géneri, and Cælia typhlus. <i>Abacroniaca</i>, Rey. &c. Cælia maculata of Catley is the Anguis centralis of Gmelin, &c.

Cælia Castra, in <i>Ancient Geography</i>, probably the Cælia of Antoninus, now Castrus, a place in Lusitania, according to Pliny and Ptolemy.

Cælitiana, in <i>Botany</i>, a name used by Pliny and some other authors for the <i>tulian</i>, or <i>andradium</i>. Sir. Emac. Ind. 2.

Cælius Statius, in <i>Biography</i>, a Latin comic poet, the contemporary and companion of Ennius, was a native of Infinian Gaul, or, as some say, of Milam, and lived at Rome in a fertile condition about the year 177 B.C. As a writer of comedy he was eminent, though Cicero finds fault with his Latin. Some fragments of his works are collected by Robert Stephens, and published in the "Corpus Poetarum," Lond. 1714. Nouv. Dict. Hist.

Cæcimacula, in <i>Entomology</i>, a species of <i>Phalaena</i> (<i>Novita</i>), with dentated grey wings, two black points at the base, and two crimson streaks. Fabr.

Cæcina, in <i>Ancient Geography</i>, a river of Italy, in Etruria.

Cæcinum, a town of Italy in Bruttium, watered by the river Cæcinus.

Cæcum, in <i>Anatomy</i>. See Cæcum.

Cæcus, in <i>Zoology</i>, a species of <i>Coluber</i>, duck-red, having its scales marked with a white spot.

Cæcutiens, in <i>Entomology</i>, a species of <i>Apis</i>, brown, with a smooth ferruginous abdomen, spotted on both sides with black. Fabricius. Found in the gardens of Lephe.

Cædius, in <i>Ancient Geography</i>, a river of Sardinia. Ptolemy.

Cælatura, or Cælatura, the art of engraving on metals, stones, woods, or the like, with instruments of steel, diamond, &c. See Sculpture.

Cælebs, in <i>Entomology</i>, a species of <i>Cimex</i> (<i>Rotundatus</i>), brownish grey, with three points on the femellum, and the apex yellow. Fabricius. Found in New Holland.

Cælestians, the followers of Cælestinus, a monk who flourished under the empire of Arcadius, about the year 405, and taught much the same doctrines as Pelagius.

The native country of Cælestians is not certainly known; some say it was Ireland; others, Scotland; and others say that he was a native of Campania in Italy. This, however, is certain, that he was detected of an illusorius family, and that, after having applied for some time to the study of the law, he retired from the world and embraced the monastic life. He accompanied Pelagius into Sicily in 408 or 409, and afterwards, in 411, into Africa; from thence he went to Asia, Rhodes, and the neighbouring islands, disseminating the doctrines of Pelagius, so that those who embraced them derived from him the appellation of Cælestians. Having been contrained to leave Constantinople in the year 416, he returned to Rome in the following year, and ingratiated himself with pope Zosimus, and obtained a letter in his favour to the African bishops. In 418, however, he was banished from Rome by virtue of a law enacted by the emperor Honorius against the Pelagians; but he afterwards returned, and was again ordered to depart from Italy. Accordingly he repaired to Constantinople, where for some time he met with a more favourable reception. At length, about the year 421, a memorial was presented against him and his accomplices, by Martin Mercer, the emperor Theodosius, and they were ordered to depart from the city. Of his subsequent history, and the termination of his life, the ancients have furnished no records. Cave, Hist. Lat. t. 11, p. 385. See Pelagians.

Cælestinf. See Cælestin.

Cælestini, in <i>Ancient Geography</i>, a people of Italy, in Umbria.

Cælestinus, in <i>Entomology</i>, a species of Cercus; exiguus, with the antennae and legs fangous. Found in Germany.

Cæletæ, in <i>Ancient Geography</i>, a people of Thrace, separated by the Hbrus. Some of them lived near Mount Hæmus, and others near Mount Rhodope.

Cælia, an episcopate of Africa, in Numidia.

Cælia, or Cælium, a town of Italy in Apulia.

Cælica, a town of Italy on a river of the same name.

Cælius Mons, a place of Vindelicia, N.E. of Lecius Brigantianus, and S. W. of Augusta Vindeliciorum.

Cælius Mons, the name of one of the seven mountains on which the city of Rome was founded, so called from Cælius, an Etruscan general.

Cælius Arbeleus, the only remaining writer of the sect of the Methodists in medicine, is supposed to have been a native of Sicca in Africa, although, as Haller observes, no reference is made to that country in his work. From his style, which is harsh and barbarous, Le Clerc supposed he lived in the 15th century. The work by which he is known is a translation into Latin of the writings of Soranus, an Ephesian physician, the head of the medical sect, to which he has added observations collected from other writers and from his own practice. It consists of eight books, three on acute and five on chronic diseases. They were first printed, "Celerum vel acutarium Paffionum Libri Tres," Paris, 1550, and "Tardarum Paffionum Libri Quinque," Basle, 1529, both in folio. Dalcopp, in 1567, published the work complete with notes, at Lyons, 8vo. It also enters into the "Medice Artis Præcepta," by Stephens and by Hailer. The work has the merit of preferring fragments from the writings of several ancient authors in medicine, which would otherwise have been lost, as well as of imparting a knowledge of their doctrines. The author is very free in his eulogies on the works he examines, and appears to have been an intelligent and attentive practitioner. He treats of several diseases not mentioned by any earlier writers, and has some observations in surgery peculiar to himself. He mentions an influence of hydrophobia occurring in a person who had not been bitten by any rabid animal, and of hydatids in some kinds of dryly. He had seen a fit of the gout terminate in apoplexy, in consequence of the too liberal use of bitter and acid substances. He recommends injections of oil for the cure of afebrades, or to destroy those worms; and has numerous other observations equally pertinent and ingenious. Le Clerc Histoire de Med. Hailer, Bib. Med.

Cæment, in a general sense, any composition of a glutinous or tenacious nature, proper to bind, unite, or keep things in cohesion.

The word is also written cement, and even cementum. It is formed from the Latin <i>cementum</i>, of cedus, I beat. Though M. Felhein observes, what the ancient architects called <i>cementum</i> was a very different thing from our <i>cement</i>. The name <i>cement</i>, with them, signified a kind of mastic, or

Vol. V.
manner of laying the flones, and even the quality of the flones; as when the walls were built of rude, unequal flones. In reality, the flones were cut for such work, but not squared or uniform; so that cement is void opposed to quadrati lapides.

Cement is particularly used in Architecture, for a strong binding of mortar, used to bind or unite bricks or flones together, for some kind of mouldings; or to make a block of bricks, for the carving of scrolls, capitals, &c.

It is of two sorts: the hot cement, which is the most common, is made of reifin, bees-wax, brick-dull, and chalk, boiled together. The bricks to be cemented are heated, and rubbed one upon another, with cement between.

The cold cement is left unused; and is made of Chelhire-cheese, milk, quick-lime, and whites of eggs. Mortar, folder, glue, &c. are cement. The bitumen brought from the Levant is said to have been the cement used in the walls of Babylon.

Equal quantities of powdered glass, sea-salt, and iron filings, mixed with loam, made a very hard and durable cement.

Mr. Boyle informs us, that the belt method to close and repair pipes of subterraneous aqueducts is with tobacco-pipe clay pulverized, and mixed with a large quantity of pulverized flours, and carefully heat up with linseed oil into a fluid paste. See Mortar and Tarras.

Cement is also used among Goldsmiths, Engravers, Jewellers, &c. for a composition of fine brick-dull, well fitted, reifin, and bees-wax; in use among those artificers to keep the metals to be engraved, or wrought on, firm to the block, &c. as also to fill up what is to be chiselled.

The receiver of an air pump may be hardened to a metaline plate by means of a cement of bees-wax and turpentines, made with equal parts, for the winter; and three parts of the former to two of the latter, for the summer. We have various receipts for making cements to mend broken china and glass: one of the finest, and at the same price more useful than any cement for this purpose, is the juice of garlic, rubbed in a stone mortar; this, if applied with care, will leave little or no mark. Another cement for broken glases, china, or earthen ware, may be prepared by beating the white of an egg very clear, and mixing it with fine powdered quick-lime; or fine glass; powdered chalk and a little lime may be mixed together, and dissolved in fair water; with which the glasses, &c. are to be cemented, and then let in the shade to dry.

Drying oil with white lead is also frequently used for this purpose; but where the vessels are not exposed to heat or moisture, fine glass glue, with a small quantity of tripoli, or chalk, is better.

Some have recommended a cement made by tempering quick-lime with the curd of milk, till it become of a proper consistence for use; but as cheese has a greater degree of tenacity than milk, the following composition will be preferable. Let the thin shavings of sweet cheese be strewed with boiling water; and when the tenacious slime has been worked with other hot water, let it be mixed on a hot stone, with a proper quantity of unflaked lime, into the consistence of a paste, and it will prove a strong and durable cement for wood, flone, earthen-ware, and glasa; and it has this advantage, that when it is thoroughly dry, it will receive no injury from water. C. Pajot, of Charlestown, lately transmitted to the Philomathic Society and the National Institute of France, small bits of glass, which he had joined and soldered to firmly, that the glasses would rather break close to the junction than in the fracture; but he concealed his process for this purpose. However, it is not difficult to be ascertained. By interposing between the broken parts a glas ground like a pigment, but more easily fusible than the pieces to be joined, and then exposing them to such a heat as will fuse the cementing ingredient, the pieces will be made to agglutinate without being themselves fused. A glas fit for the purpose of cementing broken pieces of flint may be made by fusing some of the same kind of glass, previously reduced to a powder, along with a little red lead and borax, or with the borax only.

A cement may be prepared for chemical glases that will bear the fire, by mixing equal quantities of wheat-flour, fine powdered Venice glas, pulverized chalk, with half the quantity of fine brick-dull, and a little killed lint, in the whites of eggs: this mixture is to be spread upon a linen cloth, and applied to the cracks of the glasse, and should be well dried before they are put into the fire.

Old varnish will likewise answer the same purpose. A very useful cement for joining alabaster, marble, porphyry, and other flones, may be prepared in the following manner. Melt two pounds of bees-wax, and one pound of reifin: add a pound and a half of the same kind of matter pulverized as the body to be cemented is composed of, and stir them well together; let the mass be kneaded in water, and heated when applied to the heated parts of the body to be cemented. The colour of this mass may be adapted to that of the body on which it is employed, by varying the proportion of the powdered matter added to the mass of bees-wax and reifin.

Jewellers, in joining pieces of precious flone that are accidentally broken in the operation of setting, employ a small piece of gum-mastic applied between the fragments, previously heated so as to melt the interposed gum. They are then pressed together so as to force out the redundant quantity of it. The Turkish cement for joining metals, glasa, &c. is prepared by dissolving five or six pieces of mastic of the size of peas in a sufficient quantity of spirits of wine, and dissolving as much mastic (previously softened in water) in brandy or rum, as will make two ounces by measure of strong glue; and adding two small bits of gum-calabash, or ammoniacum, ground or ground till they are dissolved; let the whole be mixed with sufficient heat, kept in a stopped phial, and when used set in hot water.

Kaffellyn recommends a cement for filling up cracks and fissures in iron vehicles, which consists of six parts of yellow potter’s clay, one part of the fillings of iron, and a quantity of linseed oil sufficient to form the whole into a paste of the consistence of putty. A durable cement for joining the flanxes of iron cylinders, and other parts of hydraulic and steam engines, may be formed by boiling linseed oil, litharge, red or white lead, duly mixed, and applied on each side of a flannel filling the joint, which should be put between the pieces before they are closely united by screws or other fastenings. Another cement that will stand the action of boiling water and steam, may be prepared by rubbing in a mortar and thus mixing together two ounces of sal-ammoniac, one ounce of flowers of sulphur, and 150 ounces of caol iron filings or borings. When this cement is wanted for use, one part of the above powder, and 20 parts of clean iron borings or filings, should be intimately blended by grinding them in a mortar, and when used, moistened with water, and applied to the joints with a wooden or blunt iron spatula.

Copper-smiths often apply to the rivets and edges of sheets of copper in large boilers, and in order to secure cocks from leaking, &c. a mixture of pounded quick-lime
lime with ox's blood. This must be used when fresh made; and it is both cheap and durable.

For an account of Higgins's water cement for building, repairing, and plastering walls, and for other purposes, see STUCCO.

The best cement for electrical purposes is made with two parts of resin, two of bees-wax, and one of the powder of red ochre. These ingredients are melted, and mixed together in any vessel over the fire, and afterwards kept for use. This adheres well, is less brittle than resin, and infuses as well. A strong cement for such purposes may be made by melting one pound of resin over a slow fire, and adding it in such manner to the wax, as to be sufficiently hardened; and then adding a spoonful of linseed oil, stirring it during the mixture. A cement for glaze-grinders may be prepared by mixing fine sifted wood-ashes with boiling pitch, and adding a little tallow, as may be found necessary. Shell-lac is a good cement for holding metals, glaze, or precious stones, while they are cut, turned, or ground. Flour paste is used as a cement by book-binders and paper hangers; and they sometimes mix with the wheaten flour a fifth or sixth of its weight of powdered resin or alum, and if it be defined of a more tenacious consistence, they add gum-arabic, or any kind of size. Japanese cement, or rice glue, is made by well mixing rice-flour with cold water, and gently boiling it. This is extremely useful on a variety of occasions; particularly in the preparation of curious paper articles, as tea-trays, dressing-boxes, and other such things, which require layers of paper to be cemented together. With this composition models, blats, statues, and pillow-relieves, may be formed; and they admit of a high polish.

For the manner of preparing a cement to bind together the various embellishments of grottoes, see GROTTO. See also GLUE, LUTE, Paste, Putty, Size, and SOLDER.

Cement, for gilding tiles. See Gilding of tiles.

Cement, in Chemistry. See CEMENT.

Cement, calcareous. See CEMENTS, calcareous.

Cement, or ziment copper, is copper precipitated from vitriolic waters by iron. The name is derived, it is said, from a vitriolic water in Hungary, called ziment.

Cement-pots, in Affixing, are vessels made for the cementation of metals. See CEMENTATION.

CEMENTARIUS, in Entomology, a species of CANcer, (AptAc) with a smooth cylindrical thorax, obtuse front, and acuted hand claws. This kind is frequent in the rivers of Chili. Molin. Hill. Nat. Chili.

CEMENTATION. See CEMENTATION.

CAEN, Lat. Cadomus, in Geography, a city of France, before the revolution, the capital of Lower Normandy, now the capital of the department of Calvados, feated in a vale at the confluence of the rivers Orne and Odon, and communicating, at the distance of about seven miles from the sea, with the English channel. Its northern and southern suburbs contain 35,900, and its two cantons 36,817 inhabitants; its whole territorial extent comprehends 87¼ kilometres, and 12 communes. The four towers of its gate were built by the English; its town-hall is a large building with four towers; its royal square, or place royale, is spacious and regular, having fine houses on three sides of it; and in the middle an equilateral statue of Louis XIV. in a Roman habit. The abbey of St. Stephen was erected by William the Conqueror, and he was buried in it. The university of Caen was founded by John, duke of Bedford, regent of France, by the authority of his nephew Henry VI. in 1431, and its establishment together with the privileges granted by him, was confirmed in 1439, by two bulls of Pope Eugenius IV. its academy of literature was instituted in 1706. This city has had great trade, which has principally consisted in cloths and fine linen.

Caen, as a part of Normandy, was formerly subject to the kings of England. In the year 1064 it was seized by Philip Augustus, King of France, and remained under the dominion of that crown till the year 1346, when it was captured, after a long and destructive siege, by Edward III. In 1417, it was again taken by the troops of Henry V. and remained in the possession of the English till the year 1448, when it was taken by Charles VII. king of France. N.-lat. 50° 11'' 10'', W. long. 0° 21'' 47''. High water at spring tides at 9 o'clock.

Caen, is also the chief city of Caen in South America. See CAEN.

CAENE, or Canepolis, in Antiquity Geography, a town of Peloponnesus in Laconia, placed by Pausanias at the distance of 46 stadia from the promontory of Tenea, and anciently denominated Tenea. It had two temples, one dedicated to Ceres, and another to Venus.

CAENoL, or Canopolis, the Caene emporium of antiquity, a town of Egypt in the Panopolitan nome, mentioned both by Herodotus and Ptolemy, and supposed to be the present Chene or Kene; which see.

CaeN, a small island in the Mediterranean, between Sicily and Africa. Pliny.

Cane, or CAEN, Sena, a town of Afia in Melopotasia, on the bank of the Tigris, over against the mouth of Zabas Minor.

CAENUS, in Entomology, a species of Papilio with very entire inunctuous wings; posterior pair beneath with a red orb consisting of nine spots. This is a native of South America. Linnaeus.

CAEN, in Ancient Geography, a people of Thrace mentioned by Livy and Steph. Byz., and called Canici by Pliny. They are supposed to have inhabited that part of Thrace, which is contiguous to the Propontis. Their country was called Canica regno, and Pliny places it in the colony Flavopolis.

CAENINA, a town of Italy on the confines of Latium, and the country of the Sabines, whence some geographers make it a city of the Sabines, and others refer it to the ancient Latium. Cluverius places it on the banks of the Anio next to Rome; but Holtenius thinks that it stood on the opposite bank in the vicinity of the present Monteicelli. Fellus says, that it derived its name from Cenis its founder; and Dionyius of Halicarnassus informs us, that it was one of the first cities which declared against Rome. In the content its king was slain, and the Cenperorcs defeated Their city was razed, and the inhabitants removed to Rome, where they enjoyed the privileges of the most ancient citizens. It afterwards became a Roman colony.

CAENIUS, or Cænis, a town and promontory of Italy, in Bruttium, upon the straits of Sicily, N. of Rhegium, and opposed to Methana or Methena.

CAENITARUM infans, an island mentioned by Arrian in his Peripius of the Erythrean sea, and supposed to be the Kavatha of Ptolemy.

CAENON, a place of Afia in Armenia Minor, mentioned by Strabo and Plutarch.

CAENOS Hydros, a place of Egypt, in the route from Coptos to Berenice.

CAENOPHRURUM, a place of Thrace in the road from Constantinopel to Heraclea, according to the Itinerary of Antonine. Here the emperor Aurelian was slain. It is placed by M. d'Anville N.W. of Selypoia.

CAENOPOLIS. See CAEN.

CAENOPTERIS, in Botany, (from κανον, new, and ωπτερες, 4 R 2 a fern,)
C A E

C A E

Gen. Ch. Fructifications in lateral, nearly circular, lines; covered with a membrane opening on the outside.

Sp. 1. C. rhizophyllum. Smith i.e. ind. 2, 50. "Frons bipinnate, rooting at the tip; pinnules biweekly egg-shaped, somewhat sickle-shaped, petiolate; primordial leaves 1.5 dm round, brown; common peduncle or rachis round, brown, smooth, elongated at the tip, leaflets, bullate, rooting; partial peduncles green, flattened, sometimes wrged: pinnules alternate, or short peltate, inserted, all-nerved, oval-shaped; fructifying, slightly sickle-shaped, often toothed at the tip, even, the upper ones usually confluent; all dusty green. Fructifications in short, solitary, lateral lines, beginning at the navel towards the base of the pinnules, and covered with an entire feathery brown membrane, opening always on the outside, at length turned back and permanent. When the capsules have emerged from the fructifying chink, numerous forked, brown, glosy threads fill up, which are the expanded rings of the capsules."

CÆRUGIA, in Geography, a town of Thrace, placed by Procopius in the province of Rhodope.

CÆNUS, a river of Galia Narbonensis, supposed to be the Ore, which fee.

CÆR, in British Antiquity, a term which, like the Saxon Cheffer, denotes cattle, and is prefixed to the names of places fortified by the Romans.

CÆRDIFF, in Geography. See CARDIFF.

CÆRE, in Ancient Geography. See AGYLLA.

CÆRESI, a people of Germany, placed by Cæfar (Bell. Gall.) between the Condurii and Pannii, and referred by d'Anville to the vicinity of the river Cliers, which runs from Luxemburg into the Meuse.

CÆRFILY, CÆRPHILLY, or CÆRPHILLY, a small town of Glamorganshire, South Wales, formerly by traditiovery account much larger than it is now, is only remarkable for the ruins of its once external castle, and the historical events connected with it. The name Cærhilly signifies cattle or hall, and it is said that great numbers of hands were employed to raise this fortress with expedition. Its ground plan covered an area of two acres, and its fos for was crossed by thirteen drawbridges. At present the ruins, says Mr. Evans, "more resemble the remains of a city, than a single edifice; and when uniled, exceeded the enormous site of Windsor castle."

The citadel, with circular bastions, a range of apartments round the inner court, the grand hall, some towers, &c. are still remaining, and whether viewed as objects of picturesque beauty, or specimens of ancient castellated architecture, they are highly interesting. Within two moats is the citadel, appearing like a separate castle, with a high Gothic arch, the centre supported by two circular bastions. This great gateway, the western entrance of the ruins, is grand and perfect, and leads to the splendid structure of the inner court from the well, as the gate with the hexagonal towers does from the cell. The inner court is surrounded by a range of noble apartments, communicating with a long gallery, to which there is an ascent from the mint, and affording a ready intercourse between the guards, who occupied the embattled towers. This corridor remains entire from the extent of about 90 to 100 feet, on the south side, except in the breaks of the flair-cales. The great hall, which is spacious and complete, exhibits a fine specimen of Gothic grandeur; and the ornamented outline of its four windows and chimney-pieces are hardly to be paralleled, together with several light pillars in triplets, that go round the room, which is about 70 feet by 30, and 17 feet high. The north window of the chapel is not only perfect, but uncommonly light and elegant. The mint is underneath, near the inclining tower, arched in a curious manner, and furnished with two furnaces for melting metal. In the interior court, at the east end, is the leaning tower, an object of considerable curiosity and general admiration. It is of a circular shape, about 75 feet high, and inclines full 14 feet out of the perpendicular. About half way down from the summit a fissure divides it, which was probably made when it was undermined. A similar instance of a leaning tower exists at Bridgeport, others at Corfe castle, and the most considerable we have heard of is that at Pisa in Italy. The immense pile of Caerpilly castle appears to have been erected at different times, and the style of building displayed in some of the exterior works indicate the time of Edward I. Here that ill-fated monarch fixed his summer resort, when pursued by his unnatural and brutal queen. With his favourite the younger Spencer, he retreated here from the forces belonging to the queen and barons, who besieged the castle, A. D. 1237, but the monarch, however, afterwards escaped. The late Mr. Daines Barrington has offered, in the first volume of the Archæologia, some reasons for supposing that Caerpilly castle was built by Edward I. and in his authority many late modern writers have acquiesced. But Mr. Malkin (ubi infra) has suggested a variety of circumstances, which invalidate this account; and particularly that of king Edward having no jurisdiction at that time in Glamorgan. From some historical documents, deduced from Welsh authors, it is inferred, that this castle was built, or rebuilt and fortified, in 1224, by John de Drue, who married the daughter of Llewelyn ap Jarweth, prince of North Wales; and that, after it had been taken and partly ruined, in 1270, at which period it first obtained the name of Caerphilly in the Welsh history, it was rebuilt by Ralph Mortimer, who married Joan of Acers in the time of Edward I. and settled this castle on him and his heirs; and that, in process of time, it was again greatly augmented and strengthened by Hugh Spencer the younger, whose wealth appears to have been fully equal to such an undertaking. Many important public events are connected with the history of this once formidable fortress. The trade of Caerpilly has lately improved in consequence of the establishment of three woolen manufactures; the effect of which is observable in traffic on the roads, and population in the town. "Evans's Tour through South Wales," Svo. 1824; and Malkin's "Scenery, Antiquities, and Biography of South Wales," 4to. 1824.

CÆRIANA, a town of Spain, placed by Ptolemy in Britzica, in the country of the Turdii.

CÆRITICES, CÆRITUM tabula, in Antiquity, denote the consors' tables, wherein were entered the names of such persons as, for some mendicant order, were to lose their right of suffrage in elections at Rome.

The original of the appellation arose hence, that during the captivity of Rome under the Gauls, the Cæritices, or inhabitants of Cære, a city in Etruria, preferred their sacred books, and other matters belonging to the worship of the gods; in gratitude for which, the Romans dignified the Cærities with the appellation of Roman citizens, but without admitting them into any part of the administration. See AGYLLA.

CAERLEON, in Geography, a small town of Monmouthshire, England, is more celebrated for its ancient, than for
for its modern importance.
Under the Anglo-Roman dynasty, it was the Itea Silvanus, the Caer Legionis Secondi of Antoninus, and the seat of government in that division of this island called Britannia Secunda. During the height of Roman splendour and dominion, this place continued a scene of pomp and luxury, as may be fairly inferred from the following description, by Gyllias Cambrensis, who wrote in the 13th century. "Many remains of its former magnificence are still visible. Splendid palaces, which once gilded the grandeur of Rome, for it was originally built by the Roman princes, and adorned with vast edifices; a gigantic tower, numerous baths, ruins of a temple, and a theatre, the walls of which are partly standing. Here we find, both within and without the walls, subterraneous buildings, aqueducts, and vaulted caverns, and flowers so excellently contrived, as to convey their heat through secret and imperceptible pores," &c. In confirmation of the monk's account, various antiquities discovered at different periods bear ample testimony. Earthen vessels of curious workmanship, tessellated pavements, phials, braes fibula, Roman bricks inscribed "L. g. 11. Aug. ;" an altar to the emperor Aurelius Antoninus; another to Jupiter, under the appellation of Dolichenius, as the patron of iron mines; another, as supposed, to the goddess Africa; and many other votive altars, monuments, statues, inscriptions, and Roman coins from Caesar to Valentinian inclusive, with mould of the intermediate emperors.

In several places the walls are still visible, but fearlessly sufficient to point out the original extent of the city. While the name of the parish, Llangattock jucca Caerleon, seems to favour the opinion that the old city was wellward of the present town, perhaps most of the buildings on that site were extra urbis; and formed fabrars, as appears from the direction of the western wall. Several barrows and mausoleums have been found, with pillars formed of circular bricks, not unlike those used by Paullus in some of the public structures at Venice. North of the town is a high mound of earth, called the Keep, said to have had formerly a strong tower on its summit; and a variety of stones lying at its base strengthen the assertion. It was probably a Roman edifice. On a rising ground, about half a mile distant, is a large square encampment, and seven smaller ones are in the vicinity.

Caerleon appears, on a superficial view, to occupy a flat position; but in reality, that portion of the present town, which is included by the Roman walls, is placed on a gentle rise, connected at one extremity with the lower part of the eminence, on which the encampment of the Lodg is situated. This rise itselfs on the west and south sides towards the Usk, and on the call towards the Avon Lively, and seems to have formed a tongue of land, which, before the draining of the meadows, was probably a kind of peninsula. Hence, the fortresses, from its position on a rise between two rivers, and almost surrounded by marshy ground, was a place of considerable strength, and well adapted to become the primary station of the Romans in Britannia Secunda. The area in which this Roman fortress was built, cannot be precisely ascertained; but Horley supposes, that the Romans first settled here in the reign of Antoninus Pius. It is mentioned in Antonine's itinerary; and the numerous coins of the early emperors, which have been discovered here, seem to confirm this opinion. The walls, however, appear to have been constructed under the lower empire.

According to Richard of Cirencester, Caerleon was a Roman colony, and the provincial station in the country of the Silures. In a field close to the banks of the Usk, and near the south-west side of the wall, is an oval concavity, meafur-
and well supplied; provisions in general are cheap, and fields exceedingly reasonable. A considerable iron foundry and tin-plate manufactory furnish employment to a number of hands. The fleming houles for lead ore, dug in the northern part of the county, belonging to lord Cawdor, are now shut up. Here are a small port and quay for coasting vessels, principally to Bristol and London. The tide rises at the bridge from eight to twelve feet; but, owing to the shallows in the bed of the river below, vessels of much burthen find a difficulty in coming up to the quay. Since the decline of the trade at Kidwelly, that of Caermarthen has increased; and with spirit and property much more might be done. Here is a ropewalk; and a few vessels are built for sale. Adjoining Lannina-leStreet are the walls of a priory of Frates Grifer: this was a cell in the custody of the abbey of St. Augustine at Bristol. In Priory street the shell of another religious house is still standing, which was appropriated to Black Friars, or canons of St. Augustine, and founded before the year 1148. The entrance into the court is by a bold gateway, over which are the arms of the founder. The principal apartments are still distinguishable, and the tracery of some of the windows almost entire. Gyralus mentions it as being, in his time, surrounded with brick wall; some remains of which, towards the river, are still extant. This town is famous for having given birth to Merlin Ambrofi, the reputed magician, of whom many fabulous stories have been related. Selden confers Merlin or Merthin (whence Caertyrddin) as having derived his name from the town; but the general opinion is, that Caer-Merlin, or Merlin’s town, was so called from Merlin’s being found there. Not far from the town is a hill, called Merlin’s Hill, near the brow of which is a rock, known by the name of Merlin’s Chair, in which, it is said, that famous prophet used to sit, when he uttered his prophecies. Caer-marten lays claim to Roman origin. It was the Mari- dunn of Antoninus, and long the seat of the South-Walian princes, where they held their great national councils, or occasional parliaments. Nor is it less conspicuous on the subsequent page of history. It was esteemed of so much importance as to become an enviable object with every hostile party, and repeatedly sacked, pillaged, and burnt, by both friends and enemies. By whom it was fortified, and its castle built, there are no authentic documents to show; nor do we hear much of it, till the era of difficulty and conflict to the Welsh, occasioned by the unjustifiable invasion and unprecedented cruelty of the Anglo-Normans. On the accession of Henry I. to the throne, Wales became a new theatre for the display of iniquity; and the oppressive measures and alienations of property, which before were chiefly confined to the borders, were extended to the interior; in consequence of which the royal residence was removed to Dinevor, and Caermarthen was rendered a strong fortified town. In 1116 we find it in the hands of the Eng- lish, held for the king by Owen ap Coradoc. But Gryf- fydd ap Rys, who well knew the importance of this place, sent spies to survey the works and ascertain their strength: having received a favourable account, he suddenly marched at night, rushed on the town, and by a coup de main took possession. The governor was killed, the garrison fled; and Gryffydd, having burnt the place, and dismantled the castle, returned with his spoils to his residence at Strata Towy. It was again laid in ashes, in 1137, by Owen Gwynedd; rebuilt and fortified by Gilbert earl of Clare; about the year 1143; taken by Cadell son of Gryffydd ap Rys; and again in possession of the English under William Tuberville, who, when it was besieged by Rhys in 1158, destroyed the bridge, at that time of wood, for its better security and de- fence. Though Rhys was unsuccessful at this time, he took and defaced it in 1195, after quelling the unnatural rebellion of his sons. In the reign of John, 1195, it was taken; and the castle was raised in 1222 by Llewelyn, who, taking advantage of the absence of the earl of Pembroke, the governor, took this fortress and Cardigan, putting the garrisons to the sword. We find it soon afterwards in the possession of the English, when the same earl of Pembroke, having conferred with the Welsh, blockaded it ineffectually for three months. The remains of this important fortress are still visible on a rocky eminence; additions have been lately made, and it is now used as the county gaol. When this territory was erected into a principality by the crown of England, the chancery and exchequer courts were held here. Caermarthen was created a borough town, 35 Henry VIII. with the privilege of returning one member to parliament. It contains 945 houses, and 548 inhabitants, has two weekly markets, Wednesday and Saturday; considerable trade, but no internal manufacturers; and is situated 226 miles W. from London. Evans’s Tour through South Wales, 8vo. 1804.

CAERMARTHENSHIRE is one of the southern counties of Wales, bounded on the north by Cardiganshire, on the east by Brecknockshire, on the west by Pembroke- shire, and on the south by Glamorganshire and part of the sea. Its extent from coast to coast is above forty-five miles, and only about twenty in the longest diameter from north to south. The general surface of this tract of country is hilly, which in the northern and eastern parts rise into mountains. As in most hilly territories, the valleys are chiefly narrow, and well watered with mountain streams, which in stormy weather rush down in torrents. Among the vales that of the Towy or Tawy is the principal: this crosses the whole of the county, and in some places is above two miles in breadth, and abounds with beauties.

The principal rivers are the Towy, the Taw, the Cotby, the Dulas, and Gwilly: the former has its source among the Cardiganshire mountains, and after its entrance into this county, at the northern boundary, is reinforced by a con- tinual succession of those numerous streams which give beauty and fertility to the landscape. Before the Towy reaches Caermarthen it receives the Cotby and Gwilly; the Cowen brings with it the Town and Carkenny; and the Taw receives the Morlas and Care.

The climate and soil of this county are much celebrated, though the lands are not found favourable to wheat. Barley and oats are the most profitable crops, and great quan- tities of the latter are annually exported to Bristol. Black cattle and horses are bred in abundance on the hills, and are the chief article of traffic in the neighbouring fairs. Wood, though still plentiful, has suffered great defaulation of late years. The county abounds with limestone, and coal is obtained in many parts of it. Iron-works, tin-works, and lead mines, also abound, which, combining with the local advantages, and with a supply of butter, stone-coal, bark, and oak timber, render the export trade very considerable.

Caermarthenshire is divided into six hundreds, and includes six market-towns, and eighty-seven parishes, which are within the diocese of St. David’s and province of Canterbury. It returns two members to the imperial parliament, one for the county, and one for the principal town. Some vestiges of Roman roads, and other monuments of remote antiquity, are remaining visible in this county. Near Whi- land is a circle of upright stones; and between the rivers Cowen and Towa is a remarkable barrow, which enclosed a kithaen. At Whiland is an encampment supposed to be Roman from the Roman coins that have been found within its valley.

CAERNARVON, the principal town of Caernarvonshire, is justly the boast of North Wales, for its situation, buildings, harbours, &c.; but above all, for the grandeur of its once magnificent castle. It is situated on the eastern bank of the river Menai, the ftrait that divides the isle of Anglesea from the other parts of Wales. This was the ancient Segontium, mentioned by Antoninus; it was a Roman station in the time of Conlantine; and Matthew Paris says, the body of Conlantinus, the father of that emperor, was found buried here, A.D. 1283. The site of the old city is about a mile distant, by the road to which from Pwllheli it is interfected. The remains of a Roman road are still visible from this place to Dinorwig. It lies on the eastern banks of the Seiont. Some remains of the walls are still to be seen, the cement of which appears as hard as the stone itself. A single stone remains here, with these letters S.V.C. probably for Segontium Urbs Conlantinii; Helen, or her husband Conlantinus, having built it. It was defended by a fort, erected on the steep western bank of the Seiont, where it forms a curve, about four hundred yards from the present town. The walls are about twelve feet high, and about eighty yards square, with circular parallel holes running the whole length. Where the facings are dilapidated, the peculiarm of Roman masonry is easily discoverable. This town, after the departure of the Romans from the island, was occupied by the Britons, and by them denominated Caer-ar-fon, i.e. a strong hold opposite Mona, which with the infertion of n for harmony, made Caernarfon. Gyraldus mentions it as a considerable place in 1138; and a charter, dated 1217, issued by Llewelyn the Great, proves that it did not receive this name from king Edward. At a very early period it was the seat of the British princes. Roderic refided here in 750; and by a posterior Roderic the royal residence was removed to Aberfraw in Anglesea. Out of the ruins of the ancient town arose the present, which by a charter of king Edward I. was made a free borough, governed by a mayor, who is pro tempore deputy-governor of the castle, one alderman, and two bailiffs; there are also a town-clerk and two ferjeants at mace. The town sends one member to parliament, who is returned by the joint suffrage of Conway, Pwllheli, Nefyn, and Crickaeth; and the right of voting extends to every person resident in these places.

An extraordinary privilege was granted to Caernarvon, that no burgeses could be convicted of any crime, committed between the Conway and the Dwyry, but by a jury of his towns- men. The town was originally contained within its present walls, but the suburbs are of greater extent than the town: the streets are at right angles corresponding with the four gates; the houses are well built, and the streets clean, but, as in all other ancient towns, narrow and confined. It is become a place of fashionable resort, during the summer season; the elegant hot and cold baths, erected by the earl of Uxbridge, having added greatly to its celebrity. On the outside of the walls is a broad and pleasant terrace walk along the side of the Menai, extending from the quay to the north end of the walls, which is a fashionable promenade in fine evenings. Caernarvon is in the parish of Llan-Beblig, and the church is situated about half a mile from the town. It contains nothing remarkable, except a marble monument, with two recumbent figures of Sir William and lady Griffith of Penllyn, who died in the year 1487. The service is always performed here in the Welsh language. There is an English service every Sunday morning and afternoon, in the chapel of ease to this church, situated on the north-west corner of the town: the former is generally very well attended.

The entrance to the port of Caernarvon is rather dangerous, from the extensive sand-banks near; but the harbour is capacious, and vessels of six or seven hundred tons ride in security; and the quay is peculiarly convenient, as large vessels can come close to it, and deliver and take in their cargoes. The trade has of late years been increasing, though at present it confines more of exports than imports. Slates, &c. are sent to Liverpool, Bristol, and London; copper ore from Llanberis and Paris Mountain to Swansea; flannels, web, flocks, and an ochre found in Anglesea, to America and the West Indies. The imports consist chiefly of Irish cloth, fine wool, hides, tallow, and grocery goods, for the use of the interior. There is a weekly market on Saturday. The county assizes are occasionally held here; and the room over the eastern gateway, formerly used as a cuflom-house, is converted into the fiefsome-houfe, where all the county business is transacted. This was done, as an inscription in front informs us, by the munificence of Sir William Wyne, and his nephew Thomas Wyne eq. A.D. 1707. A new custom-house is erected within the walls on the Menai, much more convenient for the commerce. The port is subject in its customs to the comptroller of Beaumaris. Caernarvon is distant from London 244 miles N.W.

CAERNARVON is also a township of America, in the county of Lancaster and state of Pennsylvania.
C A E

called from a figure of that bird placed at the top, is peculiarly beautiful, three small circular turrets rising from it. A magnificent apartment is shown in this tower, where, by the well-known artifices of Edward I., his queen Eleanor was delivered of her son Edward, the first prince of Wales, April 25, 1234. The walls of the eagle tower are ten feet thick, and those of the turrets in general eight. A gallery runs all round, with frequent openings for the discharge of arrows on the besiegers. A short time after the erection of the castle, the strength and importance of it were to be tried. A general insurrection was excited in different parts of Wales, in 1264, on occasion of a subsidy levied on the new subjects. Madoc, an illegitimate son of the unfortunate Llewellyn, flying himself prince, put himself at the head of the insurgents of North Wales, and proceeded to Caernarvon, which was crowded with people attending an annual fair. The unarmed multitude were barbarously slaughtered, the town reduced to ashes, and the castle taken. In 1304 this fortress was blockaded by Owen Glyndwr's adherents, but was bravely defended for the king, that the besiegers, finding their efforts fruitless, thought proper to retire. In 1303 the town was taken by captain Swanley, a parliamentarian, who pillaged it of the rooks, arms, and ammunition, making four hundred prisoners: the royalists afterwards dispossessed him. While Lord Byron was governor, it was besieged by general Myott in 1646, and surrendered on an honourable capitulation. In 1648, general Myott and colonel Milton were blockaded by Sir John Owen, who, hearing that colonel Carter and Twillerton were advancing to relieve the town, raised the siege and marched to oppose them. The parties met at Llandegai; Sir John was defeated and made prisoner, and North Wales soon after submitted to the parliament. This castle, like its rival in strength and grandeur, Conway, is going fast to decay; and the dilapidating hand of time promises soon to deprive the country of one of its principal architectural ornaments. Evans's "Tour through North Wales," 8vo. 1802. Bingham's "North Wales," 2 vols. 8vo. 1833.

CAERNARVONSHIRE, is the name of one of the counties of North Wales. It is the most mountainous district in the whole principality, and affords a truly rugged and alpine appearance. The most central part of it is occupied by that vast eminence, named Snowdon, with several other formidable hills. This county is very irregularly shaped, and is bounded by the sea on the west and south, the lakes of the Merioneth, which separate it from Anglesea, to the north, and the counties of Merioneth and Denbigh to the east. This area of country measures about forty miles from north to south, and twenty from east to west. It is divided into seven hundreds, which are again subdivided into seventy-one parishes. The principal places in the county are the city of Bangor, the town of Caernarvon, and the town of Conway. According to the population reports, published by the house of commons, the whole district contains 5,455 houses, and 4,452 inhabit-
ts, of whom most are employed in agriculture and mining. All the mountains in this county, as well as some of the low grounds on the western side, are commons; the former are chiefly depauperated by sheep, and the latter by black cattle. It is a custom among the farmers to meet annually, and determine what number of sheep each shall tend to the mountains; yet in spite of any argument, the pasturage is generally overstocked. It is common with some persons to fell this privilege at 4d. per head for the sheep, which is commonly from May, when the sheep are driven up, until Michaelmas, when they are brought down. In most ce-
itizens of this county, it is stated, that the families go up and wholly live on the mountains in the summer season, to attend their flocks, to make cheese, &c., but this is denied by Mr. Kay in his "General View of the Agriculture of the County," who says, that no such custom prevails. The wether only are sent up, and the ewes are always kept in the low grounds with their lambs. When the latter are weaned, the ewes are milked for about two months; and the produce of these is mixed with the cows' milk for making of cheese.

The exportation of slates is the principal trade from this county. These are shipped in large quantities from Caernarvon; and it is calculated by Mr. Kay, that above 3,500,000. worth are annually sent from this part of the country. Wool is also an object of considerable importance to the farmers and peasantry, many of whom are employed in manufacturing it into cloths, flannels, &c.

Of the rivers in Caernarvonshire, the Conway is the principal. This bounds the eastern side of the county, and is navigable for about 12 miles from the sea up to the interior of the country. Increased by various mountain torrents, it sometimes falls itself into a vast expanse, and in the early part of its course forms some grand cascades. Many of the rivers of this county either proceed from, or form in their course, lakes of various sizes. These are chiefly in the declivities of the mountains, and most of them are abundantly stocked with fish, among which, the char, and the grayland, are very prevalent.

The most considerable mountains are Snowdon and Penmaen-Mawr. The former is estimated to measure 3,505, or, according to other statements, 3,568 and 3,600, feet above the level of the sea at Caernarvon Quay. It is connected with a chain of other hills ranging through the county in a direction from N.E. to N.W., extending from Aberconwy to the sea, at Aberdaron. The rocks composing the higher part of this chain are principally porphyry, granite, and granitic of Kirwan; the secondary rocks are chiefly hornblende, schiller-fspar, toadstone, schistus-nica, schistus-clay, mixtures of quartz, feldspar, and mica, with argillaceous schistus in all its varieties. On the western side are a number of basaltic columns on a bed of basalt, or chert; and large coarse crystals, cubic prisms, and various mineral bodies are found in the fissions. In the felsische rocks are several slate quarries; and great quantities of slates are cut, and annually sent hence to London, Dublin, &c. Many rare and curious plants are found on these mountains, and on the borders of the lakes. The whole of the country was formerly known by the name of Snowdon, and a great part of it is still distinguished by the appellation of Snowdonia. The mountains between Conway and Caernarvon form a beautiful scene, and are seen to rife, range after range, in three gradations. The lower valleys and basins are generally very fertile and temperate, and consequently are chosen as the scenes of habitation and cultivation. The second range affords some pasture and fuel, such as long grass, peat, and flax. The highest ridge is nearly diversified with vegetation, and partsakes of the temperature of the frigid zone. Snow remains here nearly three quarters of the year; and is often found at the latter end of June.

The scenery of Caernarvonshire is peculiarly grand, romantic, and picturesque. Its narrow glens, expanded lakes, roaring cascades, and "temple-torn rocks," confirme it to render it eminently attractive to the painter, whilst its mineralogical and botanical productions are equally enticing to the mineralogist and to the botanist. For further particulars relating to the history and antiquities of particular places in this...
CAER

this county, see under the heads Bangor, Conway, Caernarvon, &c. This county returns two members to parliament. It is in the diocese of Bangor, and province of Canterbury. Kay’s “View of the Agriculture of North Wales.” A Sketch of the History of Caernarvonshire. Evans’s Tour through North Wales. Aikin’s Journal of a Tour through North Wales.

CAERSWS, at present a small hamlet, situated on the Severn, above New Town, in Montgomeryshire, North Wales, but formerly a town of considerable antiquity, and probably a Roman station, as is inferred from the fine hewn stones for building, and several bricks common in Roman cities or places policed by the Romans when in Britain. It had also a castle and a church, and the form of three camps is still indiscernible in its vicinity. The Roman road, or caufeway, called Sam-sws, runs here towards Meifod, and may be traced to the banks of the Towy, near Llŷn.

CÆRULATA, in Entomology, a species of Phalaena, (Gometra) with obscurely green wings, banded with brown, and two caruncles bands. Fabricius.

CÆRULEA, a species of Chrysomela, of a blue colour with violaceous thorax. Geoffroy. Inhabits France.

CÆRULUS, a species of Neodyolus, ceruleous, with the hinder thighs elevated and arched. Fabricius.

CÆRULUS, in a species of Cicindela, of a shining blue colour, with the mouth white. Inhabitats the great sandy deserts of Siberia. Pallas.

CÆRULUS, a species of Pinelgia, (Sepidium), cerulecent, with a roundish thorax, and fibrated extremit. Fabricius.

CÆRULUS, in Ichthyology, a species of Coryphaena, wholly ceruleous. Bloch. Found in the American ocean, clothed with large scales, compressed, and above convex. CÆRULUS, in Ornithology, a species of Ardea, called by Latham the blue heron, and blue bittern of Catesby. The back of the head is crested; colour of the body blue. Brifon calls it cancerphagus carulatus. It is the black and blue gauding of Ray and Sloane.

There are several distinct varieties of this bird, one of which is blue, with the head and collar, and a rufous brown colour; and another has the blue of the body tinged with green, and with the chin and throat white. Inhabitats America.

CÆRULUS, the species of Alcedo called by Latham the white-collared kings-fisher; ipida indica torquetta of Brifon. This bird is of a blue colour, beneath rufous, with the eye-brows and collar white. Length seven inches. Inhabitats India.

CÆRULUS, a species of Procellaria, blueish cinereous, beneath white, with the beck and legs ceruleous; the blue petrel of Latham.

CÆRULUS, a beautiful bird of the Certhia, or crecker, genus from Cayenne. The prevailing colour of the plumage is blue, with the bird across the eyes, chin, wings, and tail, black. Gmelin, &c.

CÆRULUS, a species of Columbus, blue pigeon of Latham, and the tachapiti of Ray. Found in New Spain.

CÆRULUS, the species of Muscicapus, called by Latham the azure fly-catcher, ceruleous; with a black spot on the escutent and break; the abdomen and vent bluish-white, and the feathers of the wings and tail bluish-black. Found in the Philippine Isles.

CÆRULUS, in Zoology, a species of Nereis, smooth and cerulecent. Fabricius.

CÆRULEOCEPHALUS, a species of Bombyx, common in various parts of Europe, and in England known by the trivial name of the figure-of-eight moth. The wings are greyish, varied with brown, with a large double irregular whitish spot. Linnaeus. &c. The larva feeds on apple and on other fruit trees.

CÆRULEOCEPHALUS, in Ornithology, a species of Alcedo, or kings-fisher, found in the island of Madagascar. The prevailing colour is blue above, beneath rufous; throat white; quill-feathers blackish.

The length of this bird is four inches, and it has the bill and legs of a red colour. Buffon calls it martin-pêcheur à tête bleue, and petit martins-pêcheur du Sénégal. It is the blue headed kings-fisher of Latham.

CÆRULEOCEPHALUS, in Entomology, a species of Certhia, violet coloured, with the thorax and eyestrolaceous. Found in Saxony.

CÆRULEOCEPHALUS, in Ornithology, a species of Psittacus, ceruleus, with the belly, rump, and tail green, crown yellow, and feathers of the wings and tail red; the red and blue parrot of Willughby and Latham. Found in Guinea.

CÆRULESCENS, in Entomology, a species of Cancer, abundant in the seas between the tropics. The colour is bluish; thorax smooth; half advanced, solubile, and furnished with two teeth. Fabricius. A crab of a small size.—Also, a species of Cryptoccephalus (Cithala), black, with the fibrated extremit cerulecent. Found in Barbary.

CÆRULESCENS, a species of Cerambyx (Saperda) that inhabitats Germany. The thorax is unarmed, cylindrical, white-blue; three lines on the thorax and ventral pale. Scopoli Schranck, &c.

CÆRULESCENS, a species of Chrysomela (Altius) of a greenish blue colour, and very glossy; thorax smooth; antence and legs rufous; posterior thighs black. Deguer.

CÆRULESCENS, a species of Carabus, of a blackish blue colour, with the bafe of the antennae red. Fabricius. Inhabitats Europe.

CÆRULESCENS, a species of Nereidus, with a roundish thorax, and ceruleous sub-opaque body. Fabr.

CÆRULESCENS, in Ornithology, a species of Anas, called by Latham and other English writers the Blue-winged Geese. This kind inhabitats North America; the colour is fulvous, beneath white; wing-coverts and posterior part of the back bluish. Brifon calls it anser fowlis irinti Hudsonus; Buffon, l’oise des Esquimaux. Obs. The bill and legs are red; crown yellowish, red of the head, with the collar, white; shoulders and tail waved with white and grey.

CÆRULESCENS, a species of Rallus, light-red, beneath bluish, the neck white, and legs red, the vent white, with black transverse stripes on the abdomen and tail. The blue-necked rail of Latham. Found at the Cape of Good Hope.

CÆRULESCENS, in Zoology, a species of Coluber, found in South America and India, smooth, cerulecent, and an acuminated head-coloured head.

CÆRULEUS, in Entomology, a species of Cicnex, described by Linnæus in his Fauna Svecica as being entirely of a blue colour and without spots.

CÆRULEUS, an European species of Carabus, described by Muller. The colour is black, with cyanous wing-cases; anteceint, feelers, and legs fulvous.

CÆRULEUS, a species of Rhinomacer, cerulecent, with the bafe of the antennae and legs yellow.

48  CÆR
Ceruleus, a species of Scauraleus, oblong and wholly cyanous. Found in Siberia.

Ceruleus, a species of Cuculhus, black, with a fulcated thorax, fluted ceruleous elytra, and red abdomen. Fabr. Found in Germany.—Also, a species of Cryptochalinus, azure, with brown antennæ. Found in the equatorial part of Africa.

Ceruleus, in Ornithology, a species of Cerculus, with a roundish tail and blue body. The beak, legs, and claws, are black; the remiges and tail are green and violet. Found in Madagascar. This is the blue cuckow of Latham, and tailon of Buffon.

Ceruleus, the name of a small species of Parus, called in England the blue-titmouse. The quill-feathers of this bird are bluish; primaries whithit at the outer margin; front white; crown blue. Linn. Fn. Suec.

This kind inhabits Europe. Its length is about four inches, frequents gardens, and does considerable damage by bruizing the young buds in quid of insects, on which it feeds.

Ceruleus, a species of Oriolhus, black or cyanous, with the head, wings, and tail cyanous. This is the Xanthomus ceruleus of Brifton, the small blue jay of Ray, and blue oriole of Latham. The beak is red.

Ceruleus, a species of Ramphastos, ceruleous with a mixture of cinerous; the blue toucan of Latham; found in New Spain.

Ceruleus, in Zoology, a species of Coluber, found in America, ceruleofen, with the scales white on one side, and beneath white.

Ceruleus is also a name given by Soimius to the "great Indian worm," described by Pliny and others as inhabiting the Ganges. It is conceived with much probability that all the accounts we have of this monstrous animal are only false descriptions of the crocodile.

Caerwent, in Geography, a village of Monmouthshire, England, about 4 miles from Chepilow, in the road to Newport, was a place of great importance in the Roman times, and is distinguished in the Itinerary of Antoninus by the name of Venta Silurum. This station was found, like many Roman military works, with a fortification, assuming in ground plan the parallelogramme shape, with the corners a little rounded. Such figures were called terrae castra. Each corner nearly corresponded with the four cardinal points. At the southernmost side are three pentagonal bastions; from which circumference some writers have inferred that the town was founded under the lower empire, as flanking projections were not in use before that period. Other authors refer the building of the walls to the Saxons, but from the mode of constructing them, the size and quality of the bricks, and other evidences, this seems very improbable. The circuit of the rampart, nearly a mile in extent, may still be traced, and in most places is surrounded by a deep fosse. The present walls are about nine feet in thickness at the top, and twelve feet at the base. The enclosed area is laid out in fields, and orchards; and a few cottages, with the church, parsonage, &c., occupy the site of Roman mansions and Roman temples.

Foundations of these, projecting above the level, and concealed under green hillocks, rise in many places, and columns, tessellated pavements, and coins, are continually discovered in ploughing and digging. A curious tessellated pavement was discovered about 40 years ago, and preferred under a shed constructed for that purpose. It is seven yards long and six broad, within a border of variegated stones; it contains three rows of three circular and spiral figures, not unlike those in many of our Turkey carpets, but formed of tessals of various colours, neatly put together. Some have supposed, that the exploits of Arthur were performed at this place; and that when this was totally destroyed, they were transferred through ignorance or flattery to the other Caerwent or Winchelsea, at a time when it was one of the most important cities of the island. Venta Silurum, afterwards Caer Gwent, is supposed to have possessed sufficient confluence to give name to the county of Monmouth, and those parts of Herefordshire and Gloucestershire, which long retained the appellation of Gwent-Land. In a MS. of Llandaff, Caer-Gwent is mentioned as a place dedicated to learning, and far famed for its academy, which a disciple of St. Germanus governed with great commendation. Evans's Tour through South Wales, Svo. 1804. Barber's Tour throughout South Wales, Svo. 1823.

Caerwent, or Caer-Gwent, q. d. white city, is also a name given by the first Celtic settlers in South Britain to the present city of Wincnchester, on account of the chalky cliffs that encompassed it. Under this appellation it has been recognized by the most ancient writers, domestic and foreign, who have recorded the early state of Britain. It was then no more than a collection of long cabins, built of mud, covered with reed and sheltered by the large spreading bows of the contiguous forest, and surrounded with a rampart and ditch for protection from the assaults of neighbouring tribes. The adjoining fields were devoted to the fattening of flocks and herds, on the flesh and milk of which the inhabitants subsisted, before they were acquainted with the luxury of bread, and whilst they were more the labours of tillage. It was afterwards occupied by the Belgae, who practised agriculture, and reared corn for the purpose of making both bread and beer, made cheese of their milk, and wore manufactured clothing instead of the raw hides with which their predecessors were covered. When they took possession of it, it was called "Venta Belgerrn." In 516, it was taken and almost totally demolished by Cerdic the Saxon commander; and afterwards denominated "Wintancafter," or Winchelsea, which name expresses its former importance as a Roman station. Miller's Hist. of Winchelsea, vol. i. p. 6. See Winchester.

Caerwys, a small town of Flintshire, North Wales, appears to have been a Roman station, and also a place of judicature, or the ciliiedfodd of the ancient Britons. The town now consists of four spacious streets, crossing each other at right angles. Several Roman coins, and an inhabited stone have been found here. In the vicinity of the town are many tumuli; but Caerwys is principally celebrated for its ciliiedfodd, where the feilions of bards and minstrels were held for many centuries. Judges were appointed, and bards of acknowledged merit, and minstrels, were admitted as competitors for the prize of fame. The judges were nominated by a commissión from the provincial prince, till after the conquest of Wales by Edward I., when the English monarchs sanctioned this ciliiedfodd, as an institution calculated to soften the manners of a fierce and warlike people. Previous to this, we find that Gwylffa ap Cynon, contemporary with king John, enabled that no person should follow the profession of a bard, or minstrel, who was not regularly admitted by the ciliiedfodd, which was alternately held at the three royal residences, of Caerwys, Aberfranw, and Mathravel. In 1568, a commissión was granted by queen Elizabeth, for holding an ciliiedfodd at this place, when 55 degrees were conferred on the most eminent candidates; 27 in vocal, and 28 in instrumental music. From this period the ciliiedfodd was neglected, till 1798, when a meeting was assembled by a public notice from
from the Gwneddigion, or Voudton Society instituted in London for the encouragement of Welsh literature. On this occasion the town hall was prepared for the reception of a numerous and respectable company. Twenty bards, eighteen vocal performers, and twelve harpers, assembled here, and each exhibited specimens of his respective profiiion and talents. The present town consists of 162 houses, contains 773 inhabitants, has a small weekly market on Tuesday, and is 212 miles N. W. from London. Evans's "Cambrian Itinerary," Svo 18.02.

Gen. Ch. Cal. perianth of one leaf with five divisions; tube short; segments oblong, deciduous, the lowest longer than the red, lightly vauloted. Cor. petals five, inserted into the throat of the calyx, tube, unequal. Stam. filaments ten or five, inserted into the throat of the calyx, thread-shaped, woolly or hairy at the base, declining; anthers oblong, dehisc. Pet. germ superior, linear-oblong, compressed, attenuated at the base; style thread-shaped, stigma blunt. Pr. legume oblong, compressed, one or two, or many-celled. Seeds rather egg-shaped, compressed, flat.

Ell. Ch. Calyx with five divisions; the lowest segment longer and lightly vauloted. Stamens woolly or hairy at the base. Petals five. Legume compressed.

Obi. These characters are so drawn up as to include Tournefort's Poinciana which has been admitted as a separate genus by Linnaeus, Julieron, Ventenat, Gartner, La Marec, Boile, and Poiret, the successor of La Marec in the botanical part of Encyc. Methodique; but as, according to La Marec, Poinciana differs from Cæsalpinia chiefly in the great length of its stamen, and the deep divisions of its calyx, the two genera have been incorporated by prof. Martyn and Willdenow.

Sp. 1. C. brasiliensis, Brasil-wood or brasiletto. Linn. Sp. 293. Willd. Brown Jam. 227. *STEM and leaves without prickles.* Linn. *Without prickles; leaflets ovate-oblong; racis pubescent; calyx downy; stamens shorter than the corolla.* Swartz. Observ. 166. This is said by Linnaeus and Miller to be the tree which furnishes the Brasil-wood, so well known in commerce and the arts. But La Marec, who has entirely omitted this species, affirms that the true Brasil-wood is the next species which does not occur in any of the works of Linnaeus; and it is worthy of notice that Mr. Miller, in direct opposition to the specific character of Linnaeus, describes his C. brasiliensis as armed with recurved prickles, corresponding with the descriptions of the Brasil-wood given by the older botanists, all of which are quoted by La Marec as synonyms of his C. echinata. The synonym of Brown is however an original authority for the existence of a species without prickles; and on this account we have followed Willdenow in admitting the brasiliensis of Linnaeus as well as the echinata of La Marec.

2. C. echinata, La Marec, Willdenow. Pfeuf.-fantalan rubrum, five Arbor Brasilia; Bauh. Pn. 393. Rau Hilt. 1726. Acacia Gloriosa Spina armata, cujos Lignum Brasilia dictum Tinctoria; Pluk. A. n. 5. Ibeta Pitanga, Marg. Pidorn. *STEM and branches prickly; leaflets egg-shaped, obtuse; legumen echinated.* A large tree. Branches long and spreading. Leaves alternate, twice-winged; leaflets resembling the leaves of box. Flowers in simple racemes, variegated with yellow and red, sweet-scented. Legumes dark-brown, oblong, compressed, becket with small points. Seeds reddish brown, smooth. The interior wood is of a red colour, and is covered with so thick an albumen, that it is not a tree only a very small part is fit for the use of the dyer. It cannot be used without alum and tannar, and produces only a fugitive colour. Boiled in beer, wine, or vinegar, with the addition of alum, it makes a red ink. By the means of acids it becomes a kind of carbamine; and, with different modes of treatment, is the basis of various pigments. It takes a good polish, is very hard and dry, cracks in the fire, and burns with very little smoke. A native of Fernambucb and other parts of Brazil. 3. C. bahamensis, La Marec. (Pseudo-fantalan crucorum, Sloane, Jam. Hill. 2. p. 184. Cereb. Car. 2. p. 51. t. 51.) *Branches prickly; leaflets inversely egg-shaped, emarginate; flowers white.* A shrub or small tree. Branches and common petals armed with short, scarted prickles, which are turned upwards. Leaves two-winged; leaflets smooth on both sides; pale beneath, and of a delicate green above; having, at their base, and at the base of each pinna, from two to four small, haffl prickles. Flowers whitish, in haffl racemes. Legumes oblong, pointed, peduncled, compressed. Seeds small, roundish. La Marec observes, that on account of the prickly branches, it cannot be referred to the bafliends of Linnaeus, under which that author quotes the synonyms of Sloane and Cateley. A native of Bahama and Jamaica, whence it is brought to Europe for the use of the dyer. Large quantities of it were formerly cut down in some of the Bahama islands, but it is now nearly extinguished.

4. C. secfaria, Linn. (Colensoa Vesce-cruoe, Pluk. tab. 185. Senna species Fabaceae odor, Sloan. Jam. Hilt. 2. p. 59. t. 181. f. 2, 3. Rai. den. iii. No. 18.) *STEM prickly; leaves inversely egg-shaped; racemes spinose, flowers yellow.* La Marec. *Leaves inversely heart-shaped, roundish.* Linn. A tree. Stem about fifteen feet high, nearly the thickness of a man's thigh, rather crooked, covered with an even, whitish bark. Branches crooked, prickly. Leaves alternate, twice-winged; leaflets obtuse, a little emarginate, those at the summit of the wing a little larger than the red; with a few hooked prickles at the base of each pair of leaflets, and each pair of wings. Flowers yellow in several distinct spikes. Legumes oval, nearly obtuse, blackish, furrowed. Seeds two or three. La Marec. Legumes without valves, nearly filled with a spungy substance; two celled, with a single seed in each cell. Gartner. 442. tab. 144. Ob. Prof. Poiret and Wilkenhow quote Poinciana biijuga of Linnaeus, as a synonym of this species, and suppose that it has inadvertently been described twice, under different names, and placed in different genera. Poiret, who retains the genus Poinciana, though, as he himself acknowledges, without sufficient reason, takes no notice of bijuga, and therefore seems to be of the same opinion; but in that case he ought to have noticed the omission, as his predecessor La Marec, when he wrote the article Cæsalpinia vesicaria, had certainly no idea that the Poinciana bijuga is the same plant. Martyn and Wilkenhow prefer the trivial name bijuga, and give the following specific character, "Prickly; leaves doubly pinnate with two pairs of obcordate leaflets; they and the calyx smooth; stamens equaling the corolla." A native of the West Indies. 5. C. crista, Linn. Sp. Pl. C. polyphilla aculeis horrida, Plum. gen. 26. t. 68. "Prickly; leaflets oval; racemes simple; calyx smooth; petals egg-shaped, shorter than the calyx; stamens longer than the calyx.* A small tree, or rather shrub, about four feet high. Bark rather thick, ash-coloured, without red within. Wood solid, heavy, easily cleft, of a red colour, with a white alburnum. Trunk divided near its summit into several branches, nearly the fire of a man's arm; and armed with
with numerous, scattered, short, hooked, strong, blackish prickles, each situated on a tubercle. Leaves alternate; leaflets smooth, of a pleasant green colour. Flowers pale green or whitish, with only five filaments, in upright racemes forming a pyramid. La Marck, from Plimer's MSS. A native of the Antilles, where it is called braulietto, from the resemblance of its wood to that of brazil. 6. C. lapponum. Linn. Sp. Pl. Reud. Corom. t. 17. p. 16. Gen. tab. 144. f. 1. La Marck Illust. PI. 335. fig. 1. (Ligustro brasiliense fimbriata, Bauh. Piae. 353.) Rau. Hlb. 1737. Lignum Sappan, Rhumph. Amb. 4. p. 56. t. 21. Thian pungam, Rheed. Mal. 6. p. 3. t. 2.) "Prickly; leaflets oblong, not equilateral, obtuse, a little emarginate."

A small tree. Trunk from ten to fifteen feet high. Leaves large, twice-winged; pinnules from twelve to fifteen; leaflets numerous, crowded, smooth, finely fringed, obliquely truncate at the base. Flowers yellow, sweet-scented, in racemes. Legumes somewhat woody, thick, short, somewhat rhomboidal, beaked, and one-celled, two-valved. Seeds about four, large, ovate-oblong, smooth. A native of the East Indies, Sumatra, the Molucca Islands, and Japan. Its wood is used for cabinet work; and, being very durable in sea water, is excellent for trellis in ship-building; when boiled in water, it yields a blackish colour, which, with the addition of alum, becomes red, and is much used for dyeing woollens and cottons of a beautiful red colour. 6. C. mimifoliae. Willd. La Marck. PI. 335. f. 2. (Kal-tod-da-wadi, Rheed. Mal. 6. p. 75. t. 8. Simolo malabarica, Rau. Hlb. 1740.) "Stem, pelticles, and peduncles pricky; leaflets, oblong, obtuse, small; legumes woody."

A shrub about twelve feet high, with a grey, smooth bark. Branches spreading, armed at each knot with two short, strong, crooked spines. Leaves alternate, twice-winged; leaflets from five to ten pairs, a little narrowed at the base, smaller on the upper leaves; cimitting, when bruised, a strong odour like fawin; with one gland at the base, and another on the upper part of the common petiole, and two small sharp joints a little above the base of the partial petiole. Flowers in a terminal, loose corymb, sometimes approaching to an umbel; on simple, smooth peduncles, two or three inches long; leaves of the calyx egg-shaped, concave, deciduous; petals beautifully variegated with red and yellow; legumes at least three times as long as the petals. Legume oblong, compressed, coriaceous, many-celled, two-valved; partitions rather thick, composed of rigid bristles, thickly matted together. Seeds one in each cell, ovate-quadrangular, thick, flat on both sides, smooth, a little polished, of a chestnut colour. A native of the East and West Indies. In Barbadoes it is planted in hedges, and makes a beautiful fence. In Jamaica its leaves are used as a purgative, instead of senna. All its parts are thought to be powerful emmenagogue, and are frequently used for that purpose by the negroes. Its wood is said to afford a good dye. 8. C. elata. Willd. (Poinciana elata, Linn. Sp. Pl. Forskal Flor. Aegypt. 86.) "Unarmed; leaflets linear, obtuse with a point; corollae compound; calyxes coriaceous, downy; petals fringed; legumes very long."

A shrub or small tree. Branches pubescent. Leaves alternate, twice-winged; leaflets in about twenty pairs, minute, almost smooth. Flowers in terminal corymbs, on short, fimbly, alternate peduncles; leaves of the calyx united at their base, lanceolate, pubescent, a little reflexed. Legume almost smooth, often divided between the seeds, sharp at each end. A native of the East Indies. 9. C. coriaria. Willd. (Poinciana coriaria, Jacq. Amer. 175. t. 175. f. 126. Siqueira arborea Guatapame, Breyn. Cent. p. 58. f. 5.) "Unarmed; leaflets linear, obtuse; racemes panicle; calyces filiform; legumes twice as long as the corolla."

A shrub from twelve to fifteen feet high, much branched, with dark-coloured spotted bark. Leaves alternate, twice-winged; leaflets small, smooth, about three lines long. Flowers small, yellow, in a terminal, close, spike-like raceme, on short, fimbly, peduncles, with little smel. Legume elongated, obtuse, short, a little bent, spiny. A native of Curaçoa and Carpathagna; in falt marshes. The Spaniards and natives use the ripe pods for tanning leather, and call them liobilhi.

Propagation and Culture. As all the species are natives of warm climates, they are cultivated in Europe only as ornamental plants; and though none of them have hitherto flowered in our floros, the elegance of their foliage, and the singularity of their habit, give them a distinguished place in collections of exotic plants. They can be raised only from seeds sent from the pod from their native country, and afterwards sown in water till they are swollen, and their envelope a little softened; but if kept dry, will preserve their vegetative power several years. The seeds, when taken from the water, must be sown in pots filled with a mixture of common mould and bog-earth, in nearly equal proportions, and plunged into a hot bed of tanner's bark, kept at a moderate warmth. The plants, if sown at the end of March or beginning of April, will appear in the course of May or June, and when they are three or four inches high, should be transplanted singly into separate pots, with a larger proportion of good mould. In autumn they must be removed from the hot-bed into the floros, and during the first winter must be carefully preserved from cold, humidity, and insects, and furnished with fresh air in the day-time, when the weather is favourable. They succeed better in a light, than a strong argillaceous earth.

CESALPINIA, PI. Zeyl. 157. See Guailandia Bondou. CESALPINOIDES. See Gleditschia Triaenanthus. CESALPINUS, ANDREW, in Biography, born at Arcizo in Tuscany, in the early part of the 16th century, was educated under Luke Ghinas, director of the public garden at Pisa, whence he appears to have taken his taste for botany, which he cultivated with affidity and success. But he became still more eminent for his skill in anatomy and medicine, and for his intimate acquaintance with the works of Aristotle, whose philosophy he explained and defended, in his "Quelionimus Peripateticum Libri Quinque," against the doctrines of Galen, then generally followed. This was published at Venice in 1574, 40. After taking his degree of doctor, he was made professor in medicine and anatomy in the university at Pisa, and continued in that office several years, until invited to Rome, and made first physician and archiater to pope Clement VIII. He died at Rome, aged 81 years, in 1603. His works are numerous, and give equal proofs of genius and learning.
\textit{\textbf{Cæsar.}}

\textit{De Plantis Libri xvi,"} Florent. 1583, 4to. He compares the seeds of plants to the eggs of animals; the feed serving, he says, to defend and nourish the germ until it has taken root in the earth. He also formed a system of arrangement, dividing the plants into classes, from the fructification; but as there are no engravings, or delineations of the plants, and he only gave the trivial names, the work is of little value at this time. He left a hortus focus of 750 plants, which is said to be now in being. His speculations in anatomy are still more ingenious. He describes very clearly the circulation of the blood through the heart, and was acquainted with the uses of the valves. Douglas thinks him entitled to equal praise with Harvey, who only completed what he had nearly achieved. He clearly, Douglas says, describes the contraction and dilatation of the heart, which is shown from the following passage from his fourth book, \textit{Quelitium Peripateticum.} \textit{\textit{Valorum in cor definitum quidem intromittuntur contusam in hisp sublalantiam, ut venta cava in dextro ventriculo, et arteria venalis in sinistro; quadem educat, ut arteria aorta in sinistro ventriculo, et vena arterialis in dextro; omnibus autem membranulis sunt apposite et officio delegat ut ofecta intromissionem non educant et educuant non intromittant. Continget corde contrahente, fec arterias dilatari, et dilatante constringi; dom enim dilatatur cor, claudi vult orificia educentium, ut ex corde non influit tunc sublantia in arterias, contrahente autem fe, influent dehiscientibus membranis.} \textit{The pulse, he thinks, depends on an effervescence of the blood in the heart. His works on the practice of medicine have also their portion of merit. \textit{Quelitium Medicarum Libri ii,"} \textit{De Facultatibus Medicamentorum Libri duo,"} Venet. 1593, 4to. Bleeding can only be advantageously used in the beginning of fever. In putrid fever the cure is to commence with clearing the bowels and bowels. \textit{Speculum Artis Medicæ Hippocratis, exhibens diversissimēs curandos morbos, in quo multa videtur, qua praecelerissimē medicis intacta relicta erant,"} Lion. 1601-2-3, 3 vol. 8vo. treating of the Materia Medica, fevers, lues venerea, &c. in which he advances very much extols the use of guiaum. Douglas. Bibl. Anat. Specimen. Haller. Bibl. Bot. Med. et Anat.

\textit{Cæsar, in Roman Antiquity, was a long time used for the heir intended, or preeminent of the empire; as king of the Romans is now used for that of the German empire.\textit{Cæsar, Cæsarius, or Cæsarian, in Galenic medicine, is a pusulent ulcer on the abdomen, commonly called a strangury.}}

The Cæsars were a kind of adjuncts or associates of the empire, participes imperii. They wore the imperial mantle, purple, and diadem, and walked with other marks of the sovereign dignity: they were created, like the emperors, by putting on the purple robe. The dignity of Cæsar remained the second of the empire, till Alexius Comnenus made Nicephorus Mellituris Cæsar by conquest, and it being necessary to confer some higher dignity on his own brother Isacius, he created him Sebablotector, with the precedence over Mellituris, ordering that in all acclamations, &c. Isacius Sebablotector should be named the second, and Mellituris Cæsar the third.

The title took its rise from the cognomen, or surname of the first emperor, C. Julius Cæsar, which, by a decree of the senate, all the succeeding emperors were to bear. Under his successor, the appellation Augustus being appropriated to the emperors, in compliment to that prince, the title Cæsar was given to the second person in the empire, though it still continued also to be given to the first, and hence the difference between Cæsar used simply, and Cæsar with the addition of Imperator Augustus. Athors are divided as to the origin of the word Cæsar, the cognomen of the Gems Julia. The more common opinion is, that the word Cæsar comes à cæsà natriis utero; because his mother's womb was cut open to give him birth.

If this opinion be true, the name must have survived the operation; for we are told by Tacitus (Dialog. de Orat. 28.) that the took care of his education, and by Suetonius (in Cæs. c 26.), that she died when her son was in the war against the Gauls. It is also known that she was alive when he was married to Pompeia. It has been alleged, however, that the words of Pliny (H. N. lib. vii. c. 9.), upon which this opinion is founded, have been erroneously applied to Cæsar the Dictator; whereas he meant only to express, that the first person who was surnamed Cæsar had derived his name from this circumstance.

Some pretend that the laurel crown on medals is never given to Cæsars, but only to Augusti; which is overthrown by a medallion of Maximus: not to mention another medal of the lower empire, wherein Cæsarius Cæsar is crowned with laurel. See August.

Card. Norris observes, that the years of the Cæsars were frequently marked on their medals; of which we have inferences on the medals of Conflantinus, Chlorus, and divers others, whose years are expressed on their coins, though they were never more than Cæsars. Cæsar, Caius Julius, in Biography, the dictator of Rome and founder of its imperial constitution, was a descendant of the Julian family, which boasted its derivation from Venus by Æneas, the son of Anchises, to whom fabulous history ascribes the origin of the Roman state. See Æneas. From the 10th year of the second Punic war, A. u. C. 546, till the time of Cæsarius Julius Cæsar, the emperor's father, some of the family of the Cæsars enjoyed public offices in the commonwealth. The father of Cæsar died suddenly in early life, after having occupied the station of pretor; his mother's name was Aurelia; and his aunt Julia was the wife of the celebrated Cæsarius Marius. He was born at Rome, on the 12th day of the month Quintilis, afterwards called July, A. u. C. 654, B. C. 100; and though he lost his father in his 16th year, his connections were such as to favour his introduction into life in a manner suitable to his talents. In his youth he was betrothed to Coussia, a rich heiress; but in his 17th year he broke this engagement, and married Cornelia, the daughter of L. Cornelius Cinna; and at this time he was invested with the dignity of flamén dialis. When Sylla succeeded in overthowing the Marian party, to which Cæsar owed his advancement, he was urged by this powerful dictator to divorce the daughter of his enemy; but Cæsar, refiling the injunction, was deprived of the pricily office, as well as of his own patrimony and his wife's portion, and subjected to a decree of proscription. This decree, however, was afterwards reversed, by the intercession of the Veital virgins and some distinguished persons of his own family; although in granting their petition Sylla admonished them, that they would repent of their interference, as he foresaw in Cæsar many Mariuses. Cæsar, alarmed at his jealousy, retired from Rome, and after a short interval withdrew to the court of Nicomedes, king of Bithynia, where his conduct gave occasion to some furpicious of an infamous nature. At the siege of Mytilene, in which he was employed by Thermus, who was at this time pretor of Asia, he distinguished himself by his military valour, and obtained from his general the honourable recompence of a civic crown. Having served for a short time in Cilicia, under Servilus Iauroicus, the death of Sylla made way for his return to Rome; where, declining to concur in the ambitious designs of Lepidus, he devoted himself to the study and practice of eloquence. The mal-administration of Dolabella,
Cæsar, who had been praetor of Macedon, and who had been
honoured with the confulate and a triumph, afforded him an
opportunity of gaining distinguished reputation among the
principal orators of his age, although the defeat of Brutus and
Cotta, the two most celebrated pleaders of Rome, pre-
vented his success. As at this time he does not seem to
have formed, or at least to have matured, those ambitious
defijns which led him to prefer the career of war and poli-
tics to that of an orator, he embarked for Rhodes, with
the view of gaining improvement in the art of eloquence from
the instructions of Appolionus Molon, one of the most emi-
nent rhetoricians of that period. In his passage thither, he
was captured by some pirates who infected those fears; and
during his confinement he exhibited those peculiar and extra-
ordinary talents, which were afterwards exemplified in the
progress of his life. His captors demanded 23 talents for
his ransom, but he informed them that they were not duly
apprized of the importance of their prisoner, and engaged
to pay them 500; and whilst his domestics were deputed to
raise the stipulated sum in the neighbouring cities, he re-
mained in culidy, accompanied only by one friend and two
attendants, and amused himself with reciting to his barbarous
auditors, whom he treated with contempt, some orations and
verses which he composed for the occasion; and often,
between jest and earnest, threatened them with future tokens
of his displeasure, if they disturbed his repose. Having been
furnished with the promised ransom by the inhabitants of
Mikthus, he obtained his liberty, and in that city fitted out
some ships, with which he purposed and captured the pirates;
and, having conveyed them to Pergamus, he there inflicted
upon them the punishment of crucifixion, with which he had
threatened them. He then proceeded to Rhodes, and pur-
 sued his studies.
During his residence in this city, he took
occasion to pass over to the continent, and though he had
no commission, to raise troops, and with this force to check
the progress of Mithridates, who was making depredations
on the provinces in alliance with the Romans, and to pre-
serve those cities, which were ready to revolt, ready in their
allegiance. At this time he was only 24 years of age, and
yet conducted this expedition with a prudence and bravery
which would have done honour to the veterans in military
service. On his return to Rome, the chief object of his
policy was to ingratiate himself with the people, and thus
to secure his advancement to those public offices, which would
serve him in the accomplishment of the purposes of his
ambition. Accordingly he concurred with Cicero in promoting
the Manilian law, and in thus securing the favour of Pome-
py. In the several offices of tribune, quaestor, and senate,
he contrived by his general conduct, and by his unbounded
liberality, to attach to himself the affections of the people.
He testified his respect in a variety of instances to the Ma-
rian party, although by so doing he incurred the censure of
the Aristocracy, who charged him with meditating designs
against the government. He also obtained the confulate for
L. Julius Cæsar, one of his own family, who, together with
his colleague C. Marcus Fufinus, under Cæsar’s direction
and influence, condemned many of the partisans of Sylla
either to banishment or to death. Cicatine, however, was
spared; and Cæsar is even suspected to have concurred in
his conspiracy. When this conspiracy was suppressed, and
the Senate deliberated on the punishment to be inflicted on
those who were concerned in it, he delivered an artful speech
in praise of Clemens, and his oration, which is still extant,
and which, as a composition, has been much admired, made
an impression on the assembly, which the severe eloquence
of Cato was hardly sufficient to counteract. Cæsar gave a
single vote against the death of the conspirators; and his in-
terference in their favour excited such indignation that he
escaped with his life by the seconable interpolation of Cæ-
corn, whose testimony contributed to his justification, not-
withstanding the charges alleged against him of his concern
in the plot. During the progress of this contest, Cæsar in-
dulged in the licentious gratifications of intemperance and
gallantry; and Servilia, the sister of Cato, avowed her pas-
tionate attachment to him, and he was supposed to be the
real father of her son Marcus Brutus. See Brutus.
The success of Cæsar, in his competition for the office of chief
consul, against two of the chief personages of the republic,
served to augment the jealousy entertained of him by the
Senator party. Notwithstanding the licentiousness of his
own life, his pride would not allow him to submit to the suf-
piction of domestic dishonour; and therefore, upon the dis-
coverey of an intrigue between his wife Pompeia, whom he
had married after the death of Cornelia, and P. Clodius,
(see BOUS DEO), he instantly procured a divorce, though
he did not succeed so far as to substantiate the charge; al-
leging in vindication of his conduct, “Cæsar’s wife must
not be even suspected.” At this time he was serving the
office of praetor, upon the expiration of which he prepared
for assuming the government of Parthia, Spain, comprehen-
ding Lusitania and Bretania, which fell to his lot; but his
creditors would have prevented his succeeding to his new
province, if Cæfas had not satisfied their demands. In his
journey, he passed through a miserable village on the Alps;
and when one of his companions jealously inquired,
“whether there could be any contentions for power and dig-
nity in such a place?” Cæsar, in token of his ruling passion,
replied, “I protest that I had rather be the first man here,
than the second in Rome.” His ravenous disposition, like
that of other Roman governors, was manifestly on some oc-
casions no less signal than his ambition. He considered
his government as affording the opportunity and means of
enriching himself: and, therefore, availing himself of pre-
texts for disputes, he marched into provinces unsubdued by
the Roman arms, for the purpose of plunder; and brought
back to Rome, in the following year, a sum sufficient for
discharging his debts, though they are said to have amounted
to 1,600,000, sterling.
Having passed through the subordinate offices of the
state, the next object of his ambition was the consulship. In
order to the attainment of this dignity, it was necessary for
him to connect himself with one of the two parties that
divided the power of the state, that of Pompey or that of
Cæfas. In this dilemma, he determined on reconciling the
two rivals; and accordingly he proposed a triumvirate,
in which the whole power of the state should be lodged,
and this was the first triumvirate established at Rome. See
Triumvirate. By this artful expedient Cæsar by means of
the interel of Pompey and Cæfas, secured his election to the
consulship, A. U. C. 654. B. C. 6o. Cato alone forewarned
the conseqiences of this alliance, and opposed the election;
claiming, that Rome had lost her liberty; but his opinion
was disregarded till it was too late to follow his prudent coun-
zel. The only advantage which he and his party obtained was
the election of Bibulus as Cæsar’s colleague; and for this pur-
pose they were under a necessity of counteracting Cæsar’s
interest in favour of another candidate, by outbidding him in
the purchase of votes. As soon as Cæsar entered upon
his office, he confirmed all the acts of Pompey, and pro-
cceeded to use all his endeavours for conciliating the af-
fections of the people. With this view he proposed an Agra-
rian law for the division of certain lands in Campania among
such of the poor citizens as had three or more children;
but the senators, though they approved the act, withheld
Cæsar.

their affent, till at length it was paffed by the people, and the senators were contrained to fignifie it by their affent; inofmuch that it was jocofely faid, that, instead of dating any tranfaition of this year in the usual mode, during the confuhip of Cæfar and Bibulus, it would be more proper to infert "the confuhip of Cæfar and Julius." This victory over the fenate and Bibulus made Cæfar absolute in Rome; and having feured both the people and knights, he governed with an uncontrollable fway.

As Cicero exclaimed againft the trimmivate, and thus provoked the remembrance of this bloody, they relented upon his ruin, and with this view they promoted Claudius to the tribunate, which proved eventually the caufe of his banifhment. The marriage of Cæfar's daughter Julia with Pompey, served to ftrengthen the connection between these two great men; and by marrying Calpurnia, daughter of L. Calpurnius Piso, the conft of the preceding year, he attached him to his caufe.

He also contrived by his influence on the fenate and people, together with the afiilance of Pompey and Crassus, to procure the government of Transalpine and Cilalpine Gaul, contrary to all law, for five years, with the command of four legions.

Having thus established his interef at Rome, Cæfar found it neceffary, in the year B. C. 58, to hale to Gaul, the province which was the fold of thofe military exploits, by which he acquired a degree of reputation and infuence, that ferved in the progres of his career to subjugate his country. The Helvetians, having abandoned their country, and burnt their towns and houfes, were preparing to enter Gaul by way of Geneva. Cæfar, therefore, by forced marches, reached the banks of the Rhine in eight days, and having refuced the Helvetians the liberty they folicited of pafing through the country of the Allobroges, prepared, by procuring fresh supplies of troops from Italy, to defend himfelf againft the effects of their refentment. Accordingly, while they were embaffaded in pafing the Arar, (now Saone,) he fell upon them and totally defeated them. Upon their again rallyng near Bibrae, the capital of the Aedu, and refuing him in his retreat, a bloody battle ensued, which terminated, notwithstanding the valour and obfificacy of the Helvetians, in their total overthrow; fo that they were obliged, after the losf of their baggage and many prisoners, to fupplicate his clemency; and to acquifle in the obligation which he impofed upon them, of laying down their arms, giving hostages, and returning to their own country. This victory was fo complete, that Cæfar received congratulations from all parts of the country, and the Aedu, in particular, implored his protection againft Ariovitus, king of the Germans, whom he drove back from the frontiers of Gaul to his own territories. Having fucceeded in this enterprise, he put his troops into winter-quarters, and corfing the Alps, returned into Cilalpine Gaul, in order to concert measures for the operations of the next year. In the mean while all the nations of Belgium confederated againft the Roman republic, and furnifhed ample employment for his military exertions in the courfe of the second year of his government. The fame of his exploits in difftolving their confedfacy, and fubduing them feparately, extended beyond the Rhine, and induced feve- ral remote nations to fend ambassadors to him, with offers of fubmiffion. Having difpatched his troops into winter-quarters, he reftored the Alps, and feft the winter in Infubria. By fuch conqueffes, Cæfar effaced the remembrance of Pompey's victories in the East, and by the prodigious sums, which he acquired in Gaul, chiefly by plundering the temples of their treasures, he increafed the number of his friends in Italy. The signal successes of this bloody campaign were honour'd at Rome with a fupplication, or religious thanksgiving of the unprecedented interval of fifteen days; and Pompey became jealous of a renown that foon became likely to eclips his own. In the third year of his administration in Gaul, Cæfar, whilst he was in Britan, a part of his province, received information that the Veneti, the ancient inhabitants of Vannes, in Britan, together with some other neighbouring nations, were making prepare- fations for war; upon which he fitted out a fefl, entailed the command of it to Brutus, who engaged that of the ene- my, and gained a complete victory. The Veneti prefembled; but Cæfar put their chief men to death, and sold the reli- for slaves. Crassus also, his lieutenant, reduced the whole of Aquitaine.

After fome other fafeful expeditions, Cæfar reffored the Alps, according to his usual custom, and refided for fome months in Cilalpine Gaul, whence he directed the operations of his party at Rome, and excited Claudius to commit atrocious acts of violence. He likewise concurred with Pompey and Crassus, who afpired to the confuliate, and ordered his agents to spare no ex pense in purchasing the fuffrages of the tribes, fo that these two chiefs were unani mously chosen. In the year B. C. 55, Cæfar renewed his military exploits in Gaul; and having driven back fome German tribes, which had corfed the Rhine with a defign of fetting in Belgium; and having pafed the Rhine, laid waile the country of the Sicambri, and fpread a general alarm through the parts adjacent, he returned into Gaul, refolving to pafs over into Britan, and to punish its inha bitants for furnifhing the Gauls with continual supplies against the Romans. Accordingly he fifted out a fefl, corfed the channel, and difperfed the natives who op- posed his landing. This expedition, however, though the fenate decreted him a fupplication of twenty days in honour of it, was merely preparatory to that of the following year, in which he collected 800 vefsels, and embarged with 5 le- gions, and 2000 horfe, which landed without opposition on the Kentifh cofalt, at the place of his former defcent. His progres was for fome time interrupted by a form which damaged his fefl, and required his drawing his forces towards the sea-coft. But having repaired his fattered ships, and properly fecured them, he put his troops again in motion, and advanced, notwithstanding the opposition with which he had to encounter, as far as Cowey, near Walton, where he corfed the Thames, although the enemy occu- pied the opposite bank, and had driven sharp flakis in the only part of the river that was fordable. The Britons fled in confternation; and Caffivelaunus, finding all his efforts of reffifance ineffectual, fubmitted to Cæfar, who conde- fended to give him peace; after having eftablifh'd a great number of hostages, and impofed a certain tribute to be an- nually paid to the Roman people. Having thus settled the affairs of Britan, he marched back to the sea-fide, where he embarked his troops and hostages, and arrived in safety at the continent. On his return to Gaul, he found the country grievously diftrifled by a famine, which obliged him to difperse his troops into different quarters for their more commodious fubfifience. The natives took this oc- cafion of attacking them in their winter flations; but Cæ- far by his fingular activity quelled the infurrection, and after the moft difficult and glorious campaign of any he had made in Gaul, paffed the winter in this country.

The death of Julia during Cæfar's expedition into Britan diffolved the alliance that had biflubed between him and Pompey, and hafened the revolution which was now ap- proaching. Pompey, however, was not thoroughly ap- prised.
prized of Caesar's designs, and dispatched to him two legions in order to recruit the hordes which he had furloughed. The two next campaigns in Gaul furnished Caesar with insufficient employment, and by completing the work which he had already begun, he reduced the whole country to the flat of a Roman province, and extirpated every spark of its independence. The war in Gaul lasted till the year B.C. 53; and it has been computed that, during his several campaigns there, Caesar took 500 cities or towns, subdued 300 nations, and destroyed by the sword a million of men; "titles sufficient to place him high on the list of conquerors!" The crisis of the Roman flate was now speedily approaching. The power of Pompey was supreme in the senate, and as Crassus was dead, and his interest was altogether detached from that of Caesar, he adopted various measures for mortifying his rival. The enemies of Caesar were advanced to the chief offices of the state; the legions that had been sent to him were withdrawn; and his request of continuing longer in his government was rejected. Caesar, however, professed the affections of the people, and, to him the queen of the state was secretly attached. With a moderation, therefore, real or affected, from which no danger could ensue, he proposed to disband his army, if Pompey adopted the same measure. But Pompey, being less feared by the constitutional party than Caesar, was supported by it in his refusal to acquiesce in any terms of accommodation. The former was continued in his government of Spain, whilst the like indulgence was refuted to the latter, who, having marched with a single legion across the Alps to Ravenna, in order to wait the event, was informed that the senate had issued a decree announcing him an enemy of the republic if he did not give up his command within a limited time. Three tribunes in Caesar's interest, who had proteted against this decree, were driven with violence out of the senate-house; and had fled to Caesar's camp in disguise of slaves, whose presence inflamed the minds of the soldiers. In the mean time the fatal decree was issued at Rome, which required the confunds, the pro-consul Pompey, and the confular magistrates, to provide for the public safety; which, in effect, was a declaration of war. It was in the year B.C. 50 that these important events took place, and that the civil war commenced. Two powerful parties were now taking up arms; both pretended to have nothing in view but the defence of their common laws and liberty; whilst their chiefs aimed only at establishing their own power on the ruins of that liberty which they affected to defend. Pompey's party had on their side the forms of the constitution; he was acknowledged as the general of the commonwealth, and the whole senate, with the confunds, followed his ensigns. On the other hand, Caesar seemed to have the more equitable cause, and the people, with their tribes, took part with him. The poet Lucan, who was of Pompey's party, without absolutely deciding the question between those two rivals, seems to give the advantage to Caesar, when he says, that Caesar, could not bear a superior, nor Pompey an equal.

"Nec quenquam jam ferre potell, Caezarve priorem, Pompeiue parent." Phars. L. 125.

Caesar, as soon as he received the hostile decree, confining in the attachment of his soldiers, resolved to begin the war. Accordingly he marched to the Rubicon, a small stream that separated Cisalpine Gaul from Italy. On the banks of this river he for some time paused and deliberated; but at length, crying out "the die is cast," threw himself into the stream. Having crossed this river, he became the avowed foe of his country; and therefore "this passage of the Rubicon" has been proverbially used to signify a desperate decision. Having seized the neighbouring town of Ariminum, he ordered his main army in Gaul to hasten to him, and augmented his forces by new recruits in Cisalpine Gaul. In his march he took possession of Corfinium, in which many senators had fought an asylum, and whilfe he triumphed in his conquest, he manifested his moderation by granting them their lives and liberty. By this well-timed act of clemency he firmed his cause almost as much as by the power of his arms. Rome was in the utmost confusion. The people and all the senators were alarmed; and determined, as they had no sufficient force with which to defend themselves, to retire to Capua. After the reduction of Corfinium, Pompey withdrew from Capua to Brundusium, whither he was followed by Caesar. From thence he withdrew, whilst his pursuer was inveterating the place and cutting it up by a mole, to Dyrrachium; and by his flight surrendered the whole of Italy to his rival. Whileh the lieutenants of Caesar were deputed to take possession of Sicily and Sardinia, Caesar himself advanced to Rome. On his approach to the city, he sent a message to the senators then in Italy, requesting their counsel in the capital, and quartered his troops in the neighbouring municipia. To the assembled senators he gave an account of his conduct and avowed his moderation and desire of compromising all differences; whilst the people crowdrd to see the famous conqueror of Gaul, and to congratulate him on his return after an absence of 10 years. With a view of providing for the necessary expenses of the war, he repaired to the temple of Saturn and seized the public treasurer; and thus supplied with money, he raised troops in every part of Italy, and sent governors into all the provinces subject to the republic. The war was now prosecuted with vigour. Caesar himself undertook the campaign in Spain, and soon subjugated the whole country; and on his return to Rome the pretor Lepidus nominated him dictator by his own authority. Having exercised this dignity with moderation, he changed it for that of consul. He then purposed Pompey into Greece, and landed with five legions in Chaonia; but the destruction of the greatest part of his fleet by the stronger squadron of Pompey, and the formidable force of his antagonist, induced him to propose terms of accommodation, which, though apparently reasonable, were disregarded. Anxious to effect a junction with that division of the army which was commanded by Antony, he made an attempt, the temerity of which has incurred censure. Dismayed like a slave he embarked on board a fisherman's bark for the purpose of crossing over into Italy; the vessel, however, after struggling with contrary winds, was obliged to return, notwithstanding the earnestness with which Caesar urged the crew to shun the dangers of the voyage. It was on this occasion that he is said to have discovered himself to the terrified maller, and to bid him disperse his fears, as "he carried Caesar and his fortune." This exploit is related by Plutarch, and poetically described by Lucan; but Caesar himself takes no notice of it in his Commentaries. Having received the expected succours of Antony, he followed Pompey to Dyrrachium, and determined to invest the town, together with Pompey's camp. In this siege his troops encountered a variety of hardships, which, however, their attachment to their leader induced them to endure with heroic patience. Pompey, reduced to the want of forage, and disdaining to be cooped up by his enemy in such a nook of land, determined to break through the barrier, and at length succumbed. Caesar, mortified by his escape, retired to Macedonia, whither Pompey followed him; and on the plains of Pharsalia the great conflict between these two commanders was decided, B.C. 48. The army of
of Pompey was totally routed: and Cæsar equally distinguished himself by his valor and conduct in the battle, and by his sagacity and clemency after the victory. He diffused the Roman virtue, who were made prisoners; and buried without permission, the latter, which were contained in Pompey's cabinet. Affirmative and active in pursuing the advantage he had thus gained, he left the plains of Pharsalia on the third day after the battle, and with his cavalry pursues Pompey. Crossing into Asia, and receiving on his passage the submission of a fragments of his forces, which fell into his hands, he entered to Rhodes, and embarked for Egypt.

At Alexandria he was informed of Pompey's murder: and the head of his rival, wrapped up in a veil, was presented to him as a token of his final successes. He turned his eyes from viewing the bloody spectacle, and reflecting on the fate of this eminent personage, once his friend and his kinsman, shed tears on the occasion: and distinguishing the messenger with expressions of displeasure, ordered the head to be buried with due solemnity. As a farther tribute of respect for his deceased rival, he set at liberty all his friends who had been taken on the inhospitable shore of Egypt, and imprisoned by order of the ministers of King Ptolemy. At Alexandria he took up his residence in the royal palace; but by exacting with rigour a sum of money, pretended to be due to the Roman people for their services in retorring to the throne Ptolemy Auletes, father of the present minor king, and also by undertaking to reconcile young Ptolemy with his elder Cleopatra, who, by the will of Auletes, was to have reigned jointly with her brother, but who had been expelled the kingdom, he exercised an authority which offended the Alexandrians. Accordingly they besieged him in his palace, and thus commenced the Alexandrian war, in which Cæsar failed to acquit himself either with prudence or justice. In this war part of the famous Alexandrian library was burnt in consequence of a conflagration of some ships of the Alexandrian fleet. Cæsar, who had possession of Ptolemy's peron, was at length so hardly pressed as to be obliged to surrender him in order to obtain a cessation of hostilities: but he was relieved by Mithridates, king of Pergamus. Ptolemy, however, continued the war, till he was defeated in two actions, and lost his life in the Nile by attempting to make his escape. In consequence of this event Cæsar settled the affairs of Egypt, by conferring the crown jointly on Cleopatra and a younger brother of Ptolemy. Fanciamed by the allurements of this enchanting woman, by whom he had a son, he remained in Egypt in a state of inactivity, till he was called away by the progres of Pharaces, son of Mithridates the Great, who was expelling the Romans from Asia Minor.

When the news of Pompey's death reached Rome, the senate and people concurred in accumulating honours and prerogatives on Cæsar, the only surviving master of the empire. He was proclaimed consul for five ensuing years, made tribune of the people, and created dictator for a whole year. Having defeated Pharaces in Asia, whom he pursued with a celerity, emphatically expressed in a laconic epistle to a friend, "Veni, vidi, vici," I came, I saw, I conquered; and settled the affairs of this province, he returned with only one legion through Greece to Rome, and by the moderation and placability which he exercised on this occasion, diffipated the fears of the vanquished party, and secured the fugitives of his usurpation without shedding one drop of blood. His views were next directed towards Africa, where the remains of Pompey's party maintained a formidable strength under Cato, Scipio, and other renowned leaders; whilst he was preparing for his expedition into this country, a mutiny broke out in his favourite tenth legion, which afforded occasion for a display of his distinguished talents as a commander. Having summoned them to the Campus Martius, with no other means besides their swords, he required them to file the grounds of their complaints. After some pause, occasioned by the awe of his presence, they began mutually to demand their discharge, and the rewards to which they were entitled. "Your demand," said he, "are just; you shall have your discharge. Your frauds, if you deprive of your rewards, as soon as I find we have mistaken the roll of your enemies. Go then, civitas (quiescit) return to your homes and families," Graced and mortified as being addresed with an apellation, which implied that they were no longer soldiers, they made a fresh tender of their services, and supplicated the honour of being still the companions of his victories. After some influence, and a suitable speech, he pronounced their pardon, and again addressed them as felllow-soldiers. This legion, from this time, uniformly distinguished itself by the ardour of its attachment to him. The African war commenced in the year B. C. 46, and was for some time attended with dubious successes on the part of Cæsar. However, by the celerity of his operations, he completely defeated the armies of Scipio, Labienus, and Juba; but the town of Utica was still defended by Cato and his "little senate." This true patriot, perceiving that resistance was infecetual, secured his own freedom by a voluntary death. When Cæsar had settled the government of Africa, and issued orders for the re-erection of Carthage, he returned to triumph to Rome, and was received by the senate and people with unbounded adulation. To the dictatorship, extended to ten years, was added the consulship. A double guard was assigned him, and his peron was declared sacred and inviolable. A thanksgiving of 20 successive days, and four distinct triumphs, were decreed for his victories. His triumphs over Gaul, Egypt, king Pharamas, and Juba, were conducted with singular splendour: he treated the people with shows, feasts, and donations, and conferred ample rewards on his soldiers. He also directed his attention to the reformation of the government, and enacted several salutary laws; but he refused to himself the nomination to all offices and employments. At this time he availed himself of the assistance of Sosigenes, and other men of science, in the correction of the calendar (which fe), and in the establishment of the "Julian year."

Whilst Cæsar was thus employed at home, the two sons of Pompey were collecting a considerable force in Spain, and his presence was necessary to restrain their projects. Accordingly, in his fourth consulship he detached the Spanish war, and having reduced several places, he marched to the plains of Munda, where the elder Pompey was encamped. Notwithstanding the superiority of the enemy, he advanced to the attack; and in the battle which ensued, contended for a long time, as he himself acknowledges, not for victory, but for life. So desperate were his circumstances, that, at one period of the conflict, he thought of killing himself; but recovering his self-possession, he exerted himself with such valor as to turn the fortune of the day, and in the event of the contest to annul the rebels of Roman liberty. After having completed the reduction of Spain, he returned to Rome and received new honours. The dictatorship was abolished for life: and the title of "Imperator," as head of the empire, and denoting the highest monarchial rank, was conferred upon him, and from him it was transmitted through his successors. Notwithstanding all these accessions of rank and honour, Cæsar retained the envious manners of the first citizen of the republic, and studied to ingratiate himself with the nobles and people.
people. He pleased the latter by dismissing his guards, restoring the statues of their former favourite, Pompey, and treating them with shows and largesse; and he secured the attachment of the nobles, by the multiplication of offices of dignity and profit. However, he offended the senators, by increasing their number from 300 to 900, and by admitting several patrons of low origin to this honorable class. The Romans, who entertained an inveterate prejudice against the name of king, were further offended by Antony's offering to Caesar a royal diadem; for though he refused the gift, he was suspected of being privy to the design. See Antony. It has been suggested, indeed, that as Caesar had formed extravagant schemes of conquest, comprehending an expedition against the Parthians, Hyrcanians, Scythians, and Germans, and was emulous of imitating the exploits of Alexander, he and his friends had imagined that the title of king would be serviceable to him in the execution of these grand and extensive designs, and command reverence among remote and barbarous nations. This, and a variety of other circumstances contributed to excite envy, jealousy, and resentment in the minds of several of the first men of Rome; and to concord, with some remnant of an attachment to liberty, in producing a conspiracy against Caesar's life. Caesar himself was warned of it by his friends; intimations had been circulated, for some time, of the perfons concerned in it, and of the time of its execution: and to fully 510. was and have reckoned wounds, discovered could Rolhn's treating of the uses of the Latin language. Alinus Pollio, at a period when the events which it records were recent, questioned its accuracy and veracity; and it is not improbable that the writer might have accommodated the detail of facts to the advancement of his own reputation. We have various editions of this popular work, the best of which are the "Valerius," by Elzevir, 1661; "Gravius," Amst. 1697; "Davis's," Camb. 1717; "Clarke's," fol. Lond. 1712; "Oudendorp's," J. Bat. 1737; "Barbou's," Paris, 1745.

In the exercise of his talents, Caesar polished such variety of application, and such a facility of directing his attention to different subjects, that he is said to have dictated dispatches to three secretaries at once. But whatever excellence he might possess as an orator or general scholar, his ruling passion was "ambition," and to the gratification of this he devoted, in the matured years of his life, all his mental and corporeal faculties. The influence of this passion marked and discriminated his character; and whilst it exhibits him to view as a successful warrior and useful legislator, polishing many qualities, and performing many services, which entitle him to admiration and respect, it throws a shade over his most illustrious talents and actions, and excites an abhorrence of usurpation and tyranny. "Without pretending to palliate the excesses of his youth, or to justify the schemes of his ambition, he was," says one of his biographers, "one of the most accomplished heroes that ever lived. With the molten talents for war and legislation, he polished a liberality of spirit, an elegance of taste and manners, a generosity of heart, a greatness of mind, and an humanity of disposition, which distinguished him from all the other great men of that republic, who were generally cruel, ferocious, and immoveable." "Julius Caesar," as the same writer proceeds, "is accused of having overthrown the liberties of his country. But what liberty did it enjoy before he appeared on the stage, when Rome was defoliated by the civil butcheries of Marius and Sylla? and what liberty did she retrieve, when Caesar, the supposed obstacle, was removed? The truth is, the Romans were become so prolific, vicious, and venal, and such universal corruption of morals prevailed, that they neither desired to enjoy, nor were they capable of reifying, the blessings of genuine liberty; and Caesar was the only person, when living, who could restore peace, order, and security, give confidence to their government, and stability to their empire." "He was born," says another writer, "to command mankind, if great qualities were alone sufficient, and superior to right. Had his birth or a regular election placed him on the throne, he would have been an example to be imitated by all foreigners. But his private conduct would be a very bad model; his whole life being a continued scene of rapine, extortion, luxury, and profusion, and a debauchery to all kinds of scandalous debaucheries." Sueton, Cæsar, Plutarch, C. Cæsar, oper. t. i. p. 97-37, &c. Cæsar's Comment. Anc. Un. Hist. vol. xi. Rollin's Rom. Hist. vols. viii. ix.

Cæsar, in Entomology, a species of Musca, described by Linnaeus.
Linnaeus as being of a flaxen green, with black legs. This is a common European insect.

**Caesar Augustus**, in Ancient Geography, a town of Thither Spain, seated on the river Iberus, formerly called Salduba, and which afterwards became a colony. Augustus gave it to the veteran soldiers of his army, after the war of the Cantabri, whence it obtained its name, the epithet of immunitis, and the right of coinage money; now Saragossa.

Cesarea, a name given to several ancient cities. There were two cities in Palestine of this name, viz. Cesarea Pæan or Cesarea Philippi, and Cesarea-Stratona. The former was built by Philip the tetrarch, son of Herod the Great, and made the place of his residence, as it was conveniently situated between Ituraea and Trachonitis. Luke, iii. 1. He built it, says Josephus, (Antiq. i. 18. c. 3. 1. 20. c. 8.) at Paneas, by the springs of Jordan, and called it Cesarea-Philippi, and Nerodida in honour of Nero. It was feated at the springs of Jordan the Left, not far from Libanus, in the Midland Phœnicia, says Ptolemy, and was a Decapolis city called Cesarea-Pæan, or Sub-Pæan, from the name of the mountain Panius, mentioned by Josephus and Eusebius, under which it lies. It is mentioned Matth. xvi. 13: Mark, vii. 27, and was first called Laes or Lasis, Joth. xviii. 7; and when subdued by the Danites, Dan, b. v. 29. The latter, Cesarea-Stratona, or the town of Strato, was the metropolis of Palestine, after its re-union to the Roman empire, and the seat of the Roman proconsul. As it was a mart-town, with a very incommodious heaven, Herod the Great built on the site of it a large city, with many stately marble buildings, a theatre of stone, a capacious amphitheatre, and an admirable heaven, with marble edifices and towers. Herod also constructed, on an eminence, a beautiful and magnificent temple of Augustus, and placed there a colossal statue of this prince, on the model of the statue of Jupiter Olympius; and a statue of the city of Rome, equal to that of Juno at Argos. Herod, according to Josephus, called the port Sebaite, and the city Caesarea, in honour of Caesar Augustus, which he annexed to the province of Syria. He also established quinquennial games, and distributed a great number of prizes at the first celebration of them, A. U. C. 743. The city was afterwards given to Agrippa, the grandson of Herod the Great, by the emperor Claudius. Judæa and the city of Caesarea were re-united to the Roman empire, at the death of king Agrippa, A. D. 44; nor were they seperated till the invasion of the Arabs, in the 7th century. Caesarea was situated between Doron and Joppa, 35 miles from Jerusalem, and was inhabited partly by the Jews, who had their schools there, but chiefly by the Greeks or Syrians, with whom there were feuds concerning equal privileges; so that the Caesareans killed a great number of Jews, when Florus was procurator of Judæa. In this city Peter converted Cornelius and his kinmen. Acts, x. Here lived Philip the evangelist, Acts, xxii. 8; and here Paul defended himself against the Jews, and their orator Tertullus. Acts, xxiv.

Caesarea, in more ancient times called Mazaca, and afterwards Eucibia, and denominated Cesarea by Tiberius, in honour of Augustus, was the metropolis of Cappadocia, and the residence of its kings. It continued in a flourishing state under the Greek emperors. When it was besieged by Sapor, King of Persia, about A. D. 260, it was supposed to contain 400,000 inhabitants. At this time Demetrius commanded in the place; and when the city was betrayed by the perfidy of a physician, he cut his way through the Peridians, who had been ordered to exert their utmost diligence for taking him alive, whilst many of his fellow-citizens were involved in a general massacre. Sapor is accused of treating his prisoners with wanton and unrelenting cruelty. Deep valleys were filled with the slain; and crowds of prisoners were driven to water like beasts, and many perished for want of food. Zonaras, l. xii. p. 630. After the reign of Heraclius, when the empire was divided into different military departments, Cappadocia, together with Caesarea, its capital, which had surrendered to the Saracens, was comprized in the department of Armenia; but it was, at a period not ascertained in history, ruined by an earthquake. In the 13th century, it was rebuilt about 1/4 of a league more to the north than the old city, by a sultan of the Selgouricide race. It is now called Kaffarije and Kefarea, and is a city of some note. It is the stage of all the caravans of the eali, which here differce themselves to their respective cities. The bazaars are handsone and well flored, and the inhabitants in a considerable degree polished. It was the seat of St. Basil, and its archbishop holds the first rank among the prelates who are under the patriarch of Constantinople.

Caesarea, is also a town of Armenia Minor.—Alfo, a town of Asia Minor, in Bithynia, according to Ptolemy, who places it between the river Rhyanudes and Mount Olympus, near the sea.—Alfo, a large and famous town of Africa, in Mauritania, which was formerly a royal city, and had a magnificent port on the Mediterranean. It gave the appellation Caesarienos to one of the districts into which Claudius divided Mauritania, and it was anciently called Jeral. It was the residence of king Juba, who enlarged and embellished it, and called it Caesarea in honour of Augustus. Claudius made it a Roman colony. It has been ruined for many ages. It was reduced to ashes A. D. 375, by Firmus, who assumed the title of king among the Moors, but who was made to submit by Theodorus, sent to Africa by Valentinian. When it was just recovering itself, it fell under the power of the Vandals, who burnt it. After the destruction of the Vandal government in Africa, it remained in a tranquil state for more than a century under the Greek emperors. This city was encompassed by mountains to the south, east, and west, and Procopius says, that there was no access to it but by the sea. According to Mela, it was situated at the confluence of the rivers Malucha and Ampsga. Sanfon, and other geographers, place Julia Caesarea at Thins or Ternis; but Shaw, (Travels, &c. p. 18.) adduces several arguments to prove, that it is the present Sardis, which fircr Cesarea is also a name said to have been formerly given to the island of Jericho, which fere.—Cesarea was also a town of Italy, in Cialpine Gaul, not far from Ravenna.

Caesarean Section, in Midwifery, an operation by which a fætus is extracted from the uterus of the mother, through a wound, made for the purpose, in the abdomen. The term, cesarean, is said to be derived from the operation "caeco matris utero," and Pliny even deduces the title of Cæsar, given to the Roman emperors, from one of them having been brought into the world by means of it. Whether this was the case, or not, it seems not improbable, from the prevalence of the opinion, that the operation had been performed prior to his time, although no account of it is to be found in the works of Hippocrates, Celsus, Paulus Aegineta, or Albucius, all of whom treat largely on the mode of assisting in difficult parturition. The only method recommended by these writers, for extracing the fætus when it was too large to pass entire by the natural passage, was to diminish its bulk with scissors, or other cutting instruments, and then to draw it away with hooks, or crochetts; a method, in fact, which is now followed, but with instruments more artificially constructed.
and thence is likely to injure the women, than the more rude was contrived by the ancients.

The earliest account we find of the caesarean section in any medical work, is in the Chirurgia Guilelmi de Camhus, published about the middle of the fourteenth century; but the author only speaks of it as related to the death of the woman, as was practiced, he says, on the birth of Julius Cæsar.  

Soاعت menting certain works of Galen, and the things passed;  

qui vetat les relex malheric pregnanti homini, quoniam id cruciat  

fuepsiacens quod mortuus est versus; quia vetat  

les regia malheric praegnans homini, quo fiat  

francis, et affectione filius, et materiam apertam, ut  

veneri medici, operatam nulher fecundam longitudinem, cum  

fuerint in Laete fistulae; quia pars ilia est magis libera  

domus, ut supra dictum hepar; et digitis intersitis  

extrahant fectum. Ita enim extractus fuit Julius Cæsar; ut in  

gentis legitor Romanorum." vide Cap. de extractione fectus.

Vigo, who was born towards the end of the 15th century, in the first chapter he gives on difficult birth, takes no notice of this mode of delivery; and Paré, who greatly improved the practice of midwifery, thinks the operation only allowable on women who the undelivered. He had heard, he says, not without amazement, of women who had been more than once subjected to the caesarean section, it not being practicable to deliver them by any other means; but he considered the operation as much too dangerous to be adopted, "ceterum non possimus fatia mirari cos qui fi visas  

mulieres affirmant, quibus non femel novacula absum  

cum fulfacia utero resiliunt fit ad fectum, nusquam aliquo  

practicissimo, extrahendum. Id enim, facile mater, fieri potest  

mihi perfundere, nusquam potuer." vide "De Hominis  

Generatione," cap. 31. But Rouflet, who was contemporary  

with Paré, having collected accounts of a number of cases in which the operation was said to have been successfully performed, published in 1581, says, "Traitez nouveau de l'Hydrotomotokie, ou Enlantement cæsarien, qui ell l'extraction de l'enfant par incision latérale du ventre et de la  

matrice de la fémme grôfe, ne pouvant autrement accoucher; et ce fans prejudicer la vie de l'un et de l'autre, ni empêcher la fecundité naturelle par après." But though  

Rouflet speaks with great confidence of the safety of the operation, and is warm in its recommendation, it does not appear that he had ever seen it performed, or that more  

than one of the six perfons, whose cases are related by him,  

were known to him. The book, however, soon became  

popular, and being some years after, viz. in 1647, translated  

into Latin by Caspar Bauline, with additional cases and observations, it was quickly circulated over Europe. From that time, the operation began to acquire a certain  

degree of vogue, and to be resorted to in cases of extreme difficulty, particularly on the continent, where it is said to  

have been not unfrequently performed with complete success.  

Not so in this country. In five cases in which it has been  

performed at Edinburgh, three of the children were extracted through the aperture alive, but the women all died. In England, where the operation has been performed ten  

times, one of the women only recovered. This gives little  

encouragement for repeating the trials here. But as this  

almost uniform fatality may be in part attributed to the  

extremely debilitated state of the women, who had been in  

labour several days before the operation was determined on, it has been observed, and with apparent reason, that if it had been performed earlier, before the strength of the women had been exhausted, and a feverish indisposition induced, or before the bladder and other soft parts had been injured by dilatation and pressure, a more favourable termination might have been expected; as to that circumstance, viz. a more speedy, or prompt determination, may be attributed  

the superior success with which the operation has been  

performed on the continent.

Having given this sketch of the history of the Cæsarean section, it remains to state the causes rendering it necessary, and to describe the manner of performing the operation.

Whenever any insurmountable impediment exists, rendering it impracticable to bring the child through the natural passage, recourse must be had to the Cæsarean section, or the woman, and child, must inevitably perish.

The most common impediment is, such a deformed and altered shape of the bones constituting the pelvis, as to leave too small a space for admitting the fingers of the assistant to pass between them; disabling him from introducing and directing the necessary instruments for opening and lifting the head, or other part of the child that may happen to present, or lie over the orifice of the uterus.

Abroad, particularly in France, the Cæsarean section has been performed where no such impediment existed, or, at least, not to the degree that would be required in this country; as is evident, by the accounts published of women, who after being subjected to the operation, have borne living children by the natural passage, which could not happen, if the pelvis was considerably dilated, or morphous.

Cases requiring the Cæsarean section, are very rare in this country; that is, there are very few women whose pelvis are dilated as not to allow a passage for the fingers of the assistant to conduct the necessary instruments for opening the head of the fetus sufficiently to allow its contents to be squeezed out, and its bones to collapse so far as to allow the operator to fix a hook or crotchet, with which it may be gradually drawn down, and extracted. Through how very narrow a space this may be done, we have a remarkable instance related in Dr. Osborne's "Treatise on Laborious Parturition."

Authors mention other causes of impediment to the birth of the child, as confinement of the os uteri, or of the sides of the vagina; or large tumours filling up that passage; but these may be all removed by operations much easier and less hazardous than the Cæsarean section.

Whenever on repeated examination of a woman in labour, the accoucheur finds the pelvis dilated to the degree described above, he should apprise the husband of the dangerous state of the woman, and declare the assistance of one or two of the most experienced surgeons in the profession; and if on a consultation it should appear that it is impossible to bring the child by the natural passage, the husband should be made acquainted with the nature of the impediment, and informed there remains no hope of preserving the life of the woman and child, but by opening the abdomen of the woman, and extracting the child through the wound. At the same time acquainting him, that the operation, though hazardous, is not necessarily fatal, many women who submitted to it having recovered. That the hope of a favourable termination depends on its being performed early, before fever comes on, or any material injury is done to the uterus or neighbouring parts.

If the husband should be satisfied of the necessity of the operation, the woman should then be apprised of her situation, in the most cautious manner, and having obtained her consent, a glycer is to be thrown up to evacuate the contents of the bowels, and the bladder emptied through a catheter, and a few drops of the tincture of opium given to quiet pain as much as possible, prior to the operation, the manner of performing which, is thus described by Mr. Thompson, late surgeon to the London Hospital. "Medico Observations and Inquiries," vol. 4. p. 271.
An incision is to be made on the right or left side of the navel, whichever happens to be most prominent, six inches in length; the middle of the incision to be about level with the navel, from which it should be dilatant a hand's breadth. Drift cut through the skin, then through the tendinous expansion of the abdominal muscles, and the peritoneum. The uterus being now brought to view, a small opening must be made, to enable the operator to pass his forefinger as a guide for the knife, in extending it to the size of the external wound; an astillent must then introduce his hand, and bring away the child, and the placenta. This being effected, an astillent must keep in the bowels, which would otherwise protrude, while the operator makes the gastroscopy, or future of the belly. Proper bandages are then to be put on, and the woman put to bed. The cure to be conducted in the same manner as after other operations. The subject of the Cæsarian section is treated in an ample and ingenious manner by Dr. Daman in his "Introduction to Midwifery," and by Dr. John Hull, physician at Manchester, in his "Defence of the Cæsarian Operation," 1798.

CÆSARIA, river, in Geography. See COHANZI.

CÆSARIANA, in Ancient Geography, a place of Italy, on the Appian way, situate, according to the Itinerary of Antonine, in the route from Rome to Colonia, 39 miles from Neronia, in Lucania.—Also, a place of Panorma, which, in Antonine's Itinerary, is situate on the route from Sabaria to Acenem.

CÆSARIANS, or Cæsarienses, in Antiquity, were ministers or officials of the procurator Cæfari, to whom belonged the keeping of the fiscal accounts, and taking possession of effects devolving or exchequing to the emperor. These were also called cæsarienses. From the appellation Cæsarienses some deduce the modern word sergeant. See SERGEANT.

CÆSARODUNUM, in Ancient Geography, a town of Gaul, assigned by Ptolomy to the Turbones; now Tours, which fec.

CÆSAROMAGUS, a town of Gaul, which, according to Ptolomy, was the capital of the Bilovoci; now Beauvais, which fec. - Alb., a station in the 7th route of Antonine, 28 miles from London; the position of which cannot now be exactly ascertained; but by the distance from London, and the direction of this route, it is supposed to have been at, or near, Chelmford.

CÆSENA, Cæsena, a town of Italy, in Gallia Cispadana, on this side of the Eridanus, with respect to Rome, according to Strabo and Pline.

CÆSIA Sylva, the Cæsian wood, was part of the Hercynian, placed by Clusius, partly in the duchy of Cleves, and partly in Westphalia, between Wezel and Koedel. Germanicus traversed this forest in his march to attack the Maris, whom he found in a defencelas flat, and attacked with great slaughter, A. D. 15. Tacitus.

CÆSIAS, or Kaus, in Meteorology, denotes the north-east or N. E. by wind; called in the Mediterranean, enauta Graec, or Orecteo levans. Pline calls this wind Hellepons, as blowing from the Hellepons. See EURIDYDON.

CÆSTUS, or Cæstus, a large leather gauntlet, or glove, made of straps of leather, and plated with brasses, lead, or iron, rubbed with, used in the combats, or exercises of the ancient athletes, to strengthen the hands of the combatants, and to add violence to their blows. It was called cæstus, a cæstodio, from cæstodio, to flinte, or shoot.

The cæstus originally consisted of many thongs of leather, or raw hides of bulls, wound about the hand and arm up to the elbow, and seems to have been invented, as well for a safe-guard to those parts that were most exposed in the first fury of the combat, as for an offensive weapon; though, when it was lined with plates of lead or iron, as it sometimes was, according to Virgil, (Aen. v.) it seems to have been intended chiefly for the latter purpose. It is observable, however, that the Greek poets, who have given us a description of the cæstus, have not mentioned plates of lead or iron. By thus binding up the hands of the combatants with thongs of leather, they might also design to prevent their laying hold of each other, or with their fingers and nails ripping open the belly; a circumstance, which occurred in the Nemean games, and which gave occasion for bringing the flaps of the cæstus over the fingers, and fastening them upon the wrist; whereas, before this accident, they were tied in the palm, or hollow of the hand. See Pausanius, l. c. 46. This author applies the epithet palpites, or soft, to the ancient cæstus, probably, because it was composed of raw hides. But it is not unlikely, that as the Greeks began to refine upon the gymnastic exercises, and the science of the athlete became a kind of profession, the cæstus should from time to time receive several additions: and, that at length, it should be improved by the Romans, who delighted in bloody spectacles, into thatrible weapon described by Virgil. This conjecture will account for the difference observable between that in Virgil, and those described by the Greek poets. The combat of the cæstus was very ancient, and is said to have been invented by Anyucus, king of the B. Brycians, who was contemporary with the Argonauts, as we are informed by Clemens of Alexandria, Stromat. I. It was revived in the 23d Olympiad, B. C. 488. But we are informed by Plutarch (in Alca.) that Alexander never admitted either the cæstus or the panarmion among those games which he exhibited during his war in Asia. Lycusus also banished these exercises from Sparta, because he would not allow the people to accustom themselves to yield the victory to those with whom they contended, not even in sport. Besides, the combatants in the cæstus fought after, and cherished corpulence, or polyuria, (metablastes) as the Greeks called it, a sort of covering and defence of their bones and muscles against blows and buffets; but this mode of life was improper for a soldier; for, as Olympumus observed to a fellow soldier, whom for his bulk he turned out of the army, it would require three or four shields to cover and defend a belly that hindered a man from facing his own knee. However, it was practised by the heroes of the Iliad, and it was one of the games exhibited by Alexus in honour of his father Archikles; and Amycus valued himself so much upon his superiority in this combat, as to compel all strangers who touched upon his coat, to take up the cæstus, and make trial of his strength and skill in the use of this rude instrument of death. See Wet's dissertation on the Olympic games, prefixed to his "Odes of Pindar," &c. vol. ii. p. 165.

with one or two teeth. Flowers, as well as the general habit of the plant, similar to the preceding. A native of Guinea.

CÆSURA, in Ancient Poetry, is when, in the scanning of a verse, a word is divided, so that one part fees cut off, and goes to a different foot from the rest; e. g.

\[ \text{Menti | ri no | tiu men} \]

Where the syllables ri, ti, quam, and men are cæsuras.

Or, it denotes a certain and agreeable division of the words, between the feet of a verse; whereby the last syllable of a word becomes the first of a foot; as in

\[ \text{Arna vivintur cano, Troja qui primus ab oris.} \]

Where the syllables no and je are cæsures.

CÆSURA, a cut, a separation, a breathing-place, in Vocal Music. The Germans have applied this poetical term to music, with no great analogy, and the French are trying hard to naturalize and adopt it. In the supplement to the fol. edit. of the Encyc. M. Cafliron has given it an article which in the new 4to. Encyc. Methodique, M. Framery has analysed, and contorted in an agreeable manner. The first musical dictionary in which the term occurs, is that of Walther, which, though a small octavo volume only, contains more definitions, explanations, biographical and historical articles, than all the dictionaries that have been published since 1724, when it first appeared in German. Nothing in English expresses so well what the Germans and French mean to inforce by the term cæsura in music, as the word phraseology, which see. In vocal music, the measure of the verse determines the phraseology of the melody. In instrumental music, a symmetry of phrase, to a certain degree, seems necessary, where either grace or energy is required. As to subject, the first two or three bars give the general caft and character to the whole movement. This is more obvious in Haydn's belcanto symphonies, sometimes even through a feeming wildness and freedom of fancy. If you lose the first idea in the treble, you find it in the base, or subordinate parts, as too much symmetry in the upper part is apt to degenerate into monotony and dulness. An even number of bars, and cæsures at equal distances, however, seldom fail to interest and impress the hearer. Metastasio's measures have suggested to composers, and rendered necessary, a greater variety of air, than the epic poetry of Italy, or any other country possessed before. Grace is often obtained by a succeflion of daëtyles and regular resting places.

\[ \text{Vō fōlēndō un mār eruīde} - \]

See PÆSUS, CÆSURE, CÆSURA.

CÆSURIS paribus, a Latin term, in frequent use among mathematical, and physical writers.

The words literally signify, other things being equal; which expresses pretty nearly their meaning as a term. Thus, we say, the heavier the bullet, cæsuri paribus, the greater the range; i.e. by how much the bullet is heavier, if the length and diameter of the piece, and the quantity and strength of the powder, be the same, by so much will the utmost range or distance of a piece of ordnance be greater.

Thus, also, in a physical way, we say, the velocity and quantity of blood circulating in a given time, through any section of an artery, will, cæsuri paribus, be according to its diameter, and nearness to, or distance from the heart.

CÆTOBRIX, in Ancient Geography. See CÆTOBRIGA.

CÆLTSE, in Geography, an island in the Adriatic, or Venetian Sea, which affords anchorage for shipping.

CÆFARA, a town of Portugal, in the province of Alençon, 12 miles E. of Moura.

CÆFARO, in Biography, a Neapolitan composer of great abilities, of the old school, perhaps the last, in the ecclesiastical style, after Leo. He was living in 1774; and at that time was thought by many the best composer for the church in Naples. His style was nervous, yet not rude. In his ecclesiastical productions (lays a French writer, before the revolution,) he proved that there is a style for religious rites capable of interesting a devout audience, and redoubling fervour, instead of diverting their attention from sacred concerns.

CÆFARTUTHA, in Ancient Geography, a town of Albania, or Mesopotamia; placed in the Nabian geography, between Dara and Achebubur.

CÆFER, in Entomology, a species of Cimex, found in Africa, and described by Thunberg. This insect is of a black colour, with a white band on the thorax; ferruginous wing-cafes, and four white spots. See CÆFER.

CÆFER, a species of Scarabæus, green, with the margin of the thorax and elytra spotted with white. Fabrici.ounded at the Cape of Good Hope.

CÆFER, in Ornithology, a species of Meteor, with grey plumage, a yellow spot near the anus, and very long tail. This is the grey bee-eater of Ethiopia.

CÆFER, a species of Picus, brown above, beneath grape-coloured, dotted with black, the under part of the wings and the shafts of the wing-feathers, and those of the tail vermilion-coloured. Found at the Cape of Good Hope. Gmelin.

CÆFERISTAN, in Geography. See KUTTÖRE.

CÆFFA, in Commerce, cotton cloths painted with several colours, and of divers designs; they are manufactured in the East Indies, and sold at Bengal. The length and breadth are not the same in all pieces.

CÆFFA, or Kaffa, in Geography, the ancient and modern Theodotis, a sea-port town of Cim Tartary, now called Taunda, is situated on the south-east side of the peninsula, and forms a harbour of the Euxine, or Black Sea. It was formerly the capital of the Crimea; and the Tartars distinguished it by the name of Half Constantinople. The Genoese, when they attempted to acquire an independent trade with the East Indies, took possession of it about A.D. 1226, maintained it for more than 200 years, and rendered it the seat of an extensive and flourishing commerce. They fortified the port, strengthened and augmented the fortifications, and embellished the city with many flatly edifices, the ruins of which are visible even at this day. Having the dominion of the Black Sea, and thus most commodiously lotted for trade, they were furnished with the means of expenditure by the riches accruing from their commerce. But in the year 1445 they were deprived of this port by Mohammed the Great, after they had closely afflicted in bringing the Turks into Europe, and in reducing Constantinople, against all the rules of true policy, as well as dictates of religion. After the Genoese were dispossessed of the dominion of Caffa, they still carried on, for a long time, as merchants, a very lucrative commerce with the inhabitants, who, by way of the Caffian Sea, found means to conduct a considerable trade in spices, drugs, cotton, silk, and other Indian commodities. At length the Turks became jealous of the intercourse of the Genoese in these parts, and absolutely excluded them, as well as all other nations, from trading to, or even so much as
as entering into the Black Sea. This exclusion, however, did not immediately terminate the commerce between Caffa and Genoa; for the Tartars were so well apprised of the advantages derived from this commerce, that they professed it for some time in their own vessels; and carried the spices, and other Indian goods, which they received by caravans from AEhraea, and which had been brought thither from the opposite side of the Caspian Sea, to Genoa; but the Turks soon put an end to this kind of intercourse, and thus secured themselves from the fears of seeing a Christian fleet in those seas, at least from Italy. Nevertheless, Caffa, notwithstanding all the disadvantages resulting from its subjection to the Turkish government, continued to be a place of considerable trade. Sir John Chardin, who visited it, A.D. 1674, relates, that during his residence of 40 days there, he saw more than 400 ships sailing in and out of this port. He observed also several remains of Genoese magnificence. In 1774, Catherine II. obtained for Russia the possession of the straits of Caffa, together with some other local and commercial advantages; and by the convention of 1783, the whole peninsula of the Crimea was added to the Russian dominions, under the name of the province of Taurida, and the Turks having finally ceded their pretensions to the emperors, declared this a free port in her newly acquired territories, under the apellation of Theodosia. Caffa was formerly one of the best built and richest places of its size in Europe. It stands at the foot of a small hill upon the sea-shore; the buildings extending north and south, with long walls stretching on both sides down to the sea; so that from the port, which is large, safe, and commodious, it exhibits a very agreeable appearance. On the south side is a castle, which used to be the residence of the Turkish bajhaw. The number of houses have been estimated at 5000 or 6000, and the inhabitants have been computed at 20,000. According to M. Pellyonnel, (Commerce de la Mer Noire, tom. i. p. 15.) the number of inhabitants amounts to 80,000. The bay is capable of containing several hundred merchant ships; and the inhabitants are the richest, and drive the most extensive trade in the Black Sea. The productions of Crim Tartary, exported from Caffa and the other towns of the peninsula referred to by the Greek and Armenian merchants, consist chiefly in corn, wine, wool, fine black and grey lamb-skins, and salt. The imports are fine and coarse linens, printed cloths, oaken, Russian leather, fine cloths, velvets, taffeties, furs, ropes, paper, salted fish, and civiarea, tobacco leaves, copper and tin, hardware, gold and silver thread, beads, and corals, earthen wares, a coarse sort of porcelain, and glass ware, &c. N. lat. 45° 16'. E. long. 35° 20'.

Caffa, straits of, the ancient Cimmerian Bolphorus, are the narrow passage, or found, which forms the communication between the Black Sea and the south, and the sea of Azof to the north. Near the northern entrance of these straits are the fortresses of Kertich and Yenikalé, which command the passage. They take their name from the port of Caffa. N. lat. 45° 16'. E. long. 35° 45'.

Caffa, a province or kingdom of Abyssinia, adjoining to the kingdom of Narea, and situate to the south of it. It is wholly mountainous, without any level ground. It is said to be governed by a separated prince, and to have been converted to Chriftianity in the time of Melce Segued, some time after the conversion of Narea. The inhabitants of these lofty mountains are not so dark in their complexion as Neapolitans or Sicilians. It has been said, that snow has been observed to lie on the mountains of Caffa, as well as on the high ridges called Dyre and Tegla; but the fact is discredited by Bruce; Travels, vol. ii. p. 513. About N. lat. 8°, and E. long. 35°. See Narea.

Caffa. See Caffa.

Caffa, or, as it is called, in Mineralogy, or earth of Kaffa, (corruptly called Caffa) is a very fine grained white tenacious clayey marl, dug in the Crimea, and formerly shipped from the port of Kaffa to Constantinople, in large quantities for the use of the Turkish women. Being mixed up with water to the confluence of thick cream, it was rubbed by hand among the hair, which, when washed again with water, was thus rendered perfectly clean and of a silky smoothness. For this purpose it was greatly preferable to soap, which, though it cleans the hair, is apt to discolor it, and render it harsh and brittle. When the Crimea was conquered by the Russians, this branch of commerce was stopped, and is not likely to be resumed, Constantinople being now supplied with a white clay from Asia Minor, which is equally good with the earth of Kaffa. Pallads Travels in the Crimea, vol. ii.

Caffarelli, (Gaetano Majorano, detto) was one of the greatest singers that Italy ever produced. He came to England in 1738, the year after Farinelli's departure. He sung in two of Handel's operas, Furarmond, and Alessandro Severo. But though he afterwards acquired such celebrity on the continent, he was not in high favour here. For though Farinelli, the last year of his performance in this country, had been neglected, no successor would be listened to of inferior fame, or indeed talents; for Caffarelli was never in voice or in good humour, all the time he was in England. The feeds of caprice with which nature seems to have furnished him, began early in life to spring up, and in his riper years, and fame, grew to an amazing height: Many traits of his character were current in Italy, long after he had quitted the stage.

When Giziello first sung at Rome, his performances far exceeded every hearer, that it became the general subject of conversation, which not only contributed to spread his fame through that city, but to extend it to the most remote parts of Italy; it is natural to suppose that the account of this new musical phenomenon soon reached Naples, and equally natural to imagine that it was not heard without indifference in a place where so powerful a propensity to musical pleasures prevails. Caffarelli, at this time in the zenith of his reputation, was so far piqued by curiosity, perhaps by jealousy, that he took an opportunity of the first time he could be spared from the opera at Naples, to ride pot all night, in order to hear that at Rome. He entered the pit, muffled up in a pelisse, or fur-gown, unknown by any one there; and after he had heard Giziello sing a long, he cried out as loud as he possibly could, "bravo! bravilimo! Giziello, è Caffarelli che ti lo dice," 'tis Caffarelli who applauds—and, immediately quitting the theatre, he set out on his return to Naples the same night.

When at his best, Caffarelli was thought by many a superior singer in some respects, to Farinelli; among these Porpora, who hated him for his insolence, used to say, that he was the greatest singer Italy had ever produced. At the marriage of the present King of Sardinia, then prince of Savoy, with the Infanta of Spain, who had long been a fechoral of Farinelli, it was with great difficulty that Caffarelli was prevailed on to go to Turin with the Aflrunt, to perform at the royal nuptials, in an opera which the King of Sardinia wished to have as perfect as possible. But Caffarelli, who came with an ill-will, by order of the king of Naples, seemed but little disposed to exert himself; declaring before-hand that he had lost a book of clothes on the road;
read, and should be able to do nothing. This was told to
by the Sardini Majorly, who was much perplexed how to
was the heir apparent, have a tail or none—yet,
tailed travellers, kills, "il! company now and

the

at the Cape of Good Hope, where it is found in large
in the same district, retiring by day into the thick
and appearing only in the evening and morn-
ing. It is referred to this creature, that it will often
the skin of such animals as it kills, by ticking them with
its rough tongue, as recorded by some ancient authors
of the Bible. The skin is exceedingly strong, and is on
this account in high estimation with the maligns at the
Cape, for its superior excellence in making harnesses, and other
useful articles, in which the strongest and most durable
kind of leather is required.

The body of the Cape Ox is of a black or darkish colour, and
the face is covered with long hair; the horns are
and black, lie flat upon the head, diverging to
widely, but the tips of the horns are sometimes five feet
in length; the ears are pendulous, and not unfrequently
a foot long; tail short, tufted, and black at the tip. The flesh
is coarse, and has the flavour of venison.

CAFFETANS, are long velvets of gold or silver brocade,
flowered with silk, which are presented by the grand
and the viceroy to those to whom they give audience:
by the grand viceroy before, and by the viceroy after audience.
The cacharot or the attendants are more ornate.

CAPPILA, a company of merchants or travellers, or
both together, who join company, in order to go with more
security through the dominions of the Great Mogul;
and through other countries on the continent of the East
Indies. In Peru, the cabilla differs from a caravan; as the former
properly belongs to some sovereign, or to some powerful
company in Europe; whereas, the latter consists of a
company of particular merchants, each of whom trades on
his own account. There are also such cabillas, which cross
some parts of the defects of Africa, particularly what is
called the sea of sand, which lies between Morocco, and
the kingdom of Tembuk and Gago. This is a journey of
four hundred leagues, and takes up two months in going;
and as many in coming back; the cabilla travelling only
by night, because of the excessive heat of the country.
The chief merchandise they bring back consists in gold-
dust.

The cabilla is properly what is called caravan in the
inhabitants of the Grand Mogul; and in other parts of the East
Saharan.

On the coast of Guzerat, or Cambaya, it signifies a small
at the Cape of Good Hope. Fabricius describes it as
being hirsute, black, with the posterior part of the thorax,
and anterior part of the abdomen, yellow.

Caffe, in Ornithology, a species of Certhia, of a
lustre colour, with the breast and abdomen pale, and the
middle tail feathers longest. inhabits the Cape of Good
Hope.

Cafferaria, or land of the Caffers, or Kaffers, in
Geography, an undefined district in the southerly part of
Africa; deriving its name from the Caffers, Caffers or
Kaffers, who inhabit it. The appellation is derived from the
Arabic word Caffer, which signifies an inhabited, and is ap-
plied by the Arabs, as a term of reproach, to all those who
do not profess the Mahometan religion. The Portuguese,
taking the same in a more general sense, have denomin-
ted all those nations of Africa Caffers, who have, or seem to
have
have no knowledge of a deity. Geographers have not agreed in assigning the boundaries of that country in the southern part of Africa, to which the appellation of Caffra-ría has been appropriated. By some, the name has been applied to the whole country that commences at Cape Negro; extending from thence south-easterly to the Cape of Good Hope, thence, north-easterly to the river Del Spiritu Sanóto, which separates it on the north-east from Monomotapa; reaching on the north, almost to the equator, where it borders on the kingdom of Makoko; and bounded on the north-west by Congo, or Lower Guinea, and the kingdom of Benguela. Accordingly, they have divided this extensive country into the kingdom of Matamán, the country of the Hottentots, Terra de Natal, and Terra dos Fumos. Others have divided Caffaria into two parts, viz. Caffaria Proper, and the country of the Hottentots. The inhabitants of Caffaria Proper are generally taller than the Hottentots, more robust, fierce, and warlike, and yet their manners are as inoffensive. Their figure is more graceful, their countenances are not so narrow, nor their cheeks so prominent as those of the Hottentots; neither have they the broad flat faces and thick lips of the inhabitants of Mozambique. If it were not for their colour, many of their females would be deemed beautiful even by the Europeans. They tattoo themselves very much, and wear their hair frizzled. In hot weather they are naked; but in winter they throw a "koss" of calf's or ox's skin over their shoulders, which reaches to the ground. Their huts are larger and more regular than those of the Hottentots; their frames are constructed of wood, and they are plastered within and without with a mixture of cow's dung and clay. The women form vessels of clay, and weave baskets of it close a texture as to be capable of holding milk or water. They are more disposed to agriculture than the others; nor would they wander if they were not compelled by an enemy. Their women principally prepare the fields for receiving feed, which is chiefly miller. Notwithstanding the apparent richness of their pastures, their cattle are much inferior in size to those of their neighbours. Their superior knowledge of agriculture, some dogmas of religion, greater industry, and more address in procuring simple necessaries, indicate, that the Caffres have made greater progress in civilization than the southern people. They practice circumcision, but not as a religious rite. They have elevated ideas of a supreme power, and believe in a state of future retribution; but imagine that the world is eternal. They never pray, nor have any religious ceremonies; but they have faith in forcery. They are governed by a chief, whose power is very limited: he is deemed the father of the people, and is often less rich than his subjects; for, receiving no subsidies, and being permitted to have as many wives as he pleases, his finances are not always equal to the support of his retinue; and his honour is hereditary. The Caffres are more courageous than their neighbours: they dare to face the enemy, and disdain the use of poisoned arrows. Le Vaillant's Travels into Africa. For a further account of the country and history of these people, supplied by Mr. Barrow, in his "Account of Travels into the interior of southern Africa," see KAFFERS; see also HOTTENTOTS.

CAGAR, a town of Egypt. 2 miles E. of Siut.

CAFRES. See CAFFARIA.

CAGACO, in Ancient Geography, a fountain of Greece, in Peloponnesus, near the town of Gythium, according to Pausanias.

CAGADA, in Geography, a small island of the West Indies, near the north-easterly coast of Porto Rico. N. lat. 18° 33'. W. long. 64° 10'.

Vol. V.

CAGADO de agro, in Zoology, the name by which the Portuguese in South America call a species of tortoise, common in that part of the world. The Brazilian name is jurena.

CAGADO de terra, is the Portuguese appellation of the jabotí of South America, a remarkable species of tortoise. This is the testudo terrestris of late writers. Kil. Stobaeus Ad. Litter. et Scient. Soc. 1730.

CAGADOS rocks, in Geography, are two large rocks that lie between the island of Palmas and Cape Formosa, on the western coast of Africa.

CAGANUS, or CACANUS, an appellation anciently given by the Huns to their kings.

The word appears also to have been formerly applied to the princes of Mulcov, now called CLEAK.

From the same also, probably, the Tartar title CHAM, or CHAN, had its origin.

CAGAYAN, or CAGEAN, in Geography, a province in the northern part of the island of Luzon or Manila, in the East Indies. It is the largest in the island, being 80 leagues in length, and 40 in breadth. The chief city is New Segovia, which is seated on the banks of a river of the same name, which runs almost across the whole province. In this city is the cathedral church; and here refines the chief Alenayde, with a garrison of Spanish foot. This province commences with the most northerly cape called Del Engano; and after doubling Cape Bejador, which is 13 leagues from the capital eastward, and coasting from north to south 20 leagues, the province terminates on the boundaries of that of Illocos. The peaceable Cagayans, who pay tribute, are about 8000, besides those that are not subdued. The whole province is fruitful; the men are robust, employed in agriculture, and of a martial disposition; and the women apply to several works in cotton. In the mountains bees are so plentiful, that the poor burn wax instead of oil; and they abound with braflf, ebony, and other sorts of valuable wood. In the woods are many wild beafts, particularly boars, and also deer, which they kill for their skins and horns, purchased by the Chinese.

CAGE, an inclosure made with wire, wicker, or other matter, interwoven latteinewife, for the detention of wild beasts or birds. The word is French, cage, formed from the Italian cagia, of the Latin cagea, which signifies the fame: a cagea theatralibus in quibus includantur ferae. Beaws were usually brought to Rome shut up in oak or beechen cages, artfully formed, and covered or shaded with boughs, that the creatures, deceived with the appearance of a wood, might fancy themselves in their forest. Those of the fiercer sort were kept in iron cages, left wooden pinaaos should be broke through. In some prisons there are iron cages for the clofer confinement of criminals. The French laws distinguish two forts of bird-cages, viz. high, or finging cages, and low, or dumb cages; those who expel birds to sale are obliged to put the hens in the latter, and the cocks in the former, that persons may not be imposed on, by buying a hen for a cock.

CAGES, cagea, denote also places in the ancient amphitheatres, wherein wild beasts were kept, ready to be let out for sport. The cagea were a sort of iron cages different from dens, which were under ground and dark; whereas the caue being airy and light, the beasts rushed out of them with more alacrity and ferceness than if they had been pent under ground.

CAGE, in Agriculture, an inclosure formed of wire or wicker-work, for the purpose of containing different sorts of poultry or other animals. It also signifies a machine for weighing live animals of the sheep, pig, and other small kinds. See MACHINE.
CAGE, in Carpentry, signifies an outer work of timber, enclosing another within it. In this sense we say, the cage of a windmill. The cage of a stair-case denotes the wooden fیدx. or walls which enclose it.

CAGELO, in Geography, a town of Italy, in the kingdom of Naples, and province of Calabria Ultra; 6 miles S.W. of Grace.

CAGGAR, or KENAA, a river of Hindoostan, which rises in the mountains that separate Sirhind from Calillore and Sirinagur, about N. lat. 35° 45', and E. long. 76° 43', and pursing its course to the south-west, and meeting with the Surfooty, and other smaller streams, discharges itself into the gulph of Cutch.

CAGLEW, in Botany, a name given by the people of Guinea, to a plant which they boil in water, and use the decoction to wash the mouth with, as a cure for the tooth-ach. The leaves of this are smooth and shining, like those of the hurel, but they are thin, and bend like those of the bay. Phil. Trans. No. 232.

CAGHNEWAGA, in Geography, the name of a small village or district on the north-side of Mohawk river in the township of Johnstown, about 24 miles W. of Schenectady in North America. It might probably have been formerly inhabited by a tribe of Indians of Lower Canada, of the same name, some of whom are found near Montreal.

CAGIT, in Natural History, a name given by the people of the Philippine islands to a species of parrot, very common in their woods; it is of a middling size, and is all over of a fine green colour.

CAGLI, in Geography, a town of Italy, in the duchy of Urbino, built near the ruins of the ancient Callium, on the Cantiano; the see of a bishop, suffragan of Urbino; 18 miles S. of it. N. lat. 43° 30'. E. long. 14° 12'.

CAGLIA, or MATAPAN capo, the south-west point of the Morea. N. lat. 36° 33'. E. long. 22° 36'.

CAGLIAARI, Paolo, usually called PAOLO VERONESE, in Biography, an historical painter, was born at Verona in 1539, and became a disciple of his uncle, Antonio Badiglio, a principal artist at Verona. His talents displayed themselves at an early period; and at Mantua, whither he was conducted by cardinal Hercules Gonzaga, he was distinguished above all his fellow artists. At Venice, the prize of a large gold chain, offered by the procurators of St. Mark for the best picture painted by six eminent artists, was adjudged to Cagliari, by Titian and Sanfiovino.

Having executed several subjects, chiefly of the light and rural kind, exhibiting the fertility of his invention, and the brilliancy of his pencil, in the Venetian territories, he engaged in larger works for churches at Venice and Verona, which served further to advance his reputation. At Rome, whither he accompanied Grimani, ambassador from Venice to the pope, he much improved his style by an inspection of the works of Raphael and Michael Angelo Buonarotti; and on his return to Venice, the doge conferred upon him the honour of knighthood. Only felicitous of the honour to which he attained, in his own country, he declined accepting the invitation of Philip II. to go to Spain, and paint at the Escorial, and sent Zuccheru as his substitute. Such was the respect in which he was held by his brother artists, as well as by persons of distinction, that Titian is said to have grieved him with an embrace, whenever they met; and Guido declared, that next to Raphael and Correggio, he would rather be Paolo Veronese than any other painter of his time. By the number and value of his performances he acquired not only fame, but wealth; and yet he disregarded money, and generously parted with it, whenever any suitable occasion offered. Of his generosity, as well as facility in the exercise of his art, the following instance is recorded. Having been detained on a journey, and hospitably entertained at the house of the Pilani family, he secretly painted, during his stay, a picture of the family of Darius, consisting of 20 figures as large as life; and leaving the canvas rolled up under his bed, he informed his hosts that he had left something behind him towards paying his expenses. This artific, whose superior merit has been universally acknowledged, died of a fever at Venice, in 1588, at the age of 58 years, and was buried in the church of St. Sebastian, which he had previously decorated by his own hand. The pictures of this master were rendered singularly beautiful by the excellence of their colouring, by the magic effects of light and shade, and by the grace and harmony of composition. But in order to produce this kind of beauty, which charmed the eye, he sacrificed much expression, correctness of drawing, propriety of costume, and other qualities which satisfy the mature judgment. Of his pictures, which are dispersed all over Europe, some of the principal are in the palace of St. Mark at Venice, and in the churches of that city, and of others in the north of Italy. Among his most celebrated pieces, are the Four Banquets; and of these, the Marriage at Cana, once in the refectory of the convent of St. George at Venice, now in the Louvre, containing of at least 150 figures, is reckoned one of the most capital performances in Europe. Many of his works have been engraved by the principal artists of their time. For his amusements he etched some few plates, which flew the hand of the master. Among these are the Adoration of the Magy, and Two Saints, fleeing." His sons, Carletto and Gabriel, acquired, also, eminence as painters. Carletto was born at Venice, in 1570; and possessed a genius, which, under the instruction of his father, manifested itself betimes, and arrived at an early maturity; so that he promised to have equalled, if not to have exceeded his father. But by incessant application, he impaired his constitution, and died in 1596, at the age of 26 years.

Gabriel was born at Venice in 1568, and having talents inferior to those of his brother, he turned his attention to commerce. He died 1651.

These brothers finished works, which had been left imperfect by their fathers; and several pictures of their own design and execution have been ascribed to him; nor can some of them be easily distinguished from those of this great master. They were ascribed by their uncle Benedetto, or Benedetto, who was born at Verona in 1538, and died in 1595. He ressembled his brother Paolo in his style of painting, but his peculiar excellence consisted in the architectural figures, with which he enriched the compositions of his brother. At Venice there are several paintings, designed and executed by himself, which are much admired. D'Argenville. Pilkington. Strutt.

CAGLIARI, or CALARI, in Geography, a sea-port city, and capital of the island of Sardinia, is situated in the northern part of the island, on the declivity of a hill, and has a large and secure harbour, screened by a small island called "Pietra Laidia"; and defended with a castle and fortifications. It is large and populous, the number of inhabitants amounting to about 50,000, and carries on a considerable commerce. It is the seat of an archbishop, and the residence of a vicar; and contains five churches besides the cathedral, and 25 convents. In 1708, it surrendered, upon an attack of the British fleet, to the emperor Charles VI.; but in 1717 it was retaken by the Spaniards, and about two years afterwards ceded to the duke of Savoy in lieu of Sicily, who obtained the title of king of Sardinia. N. lat. 39° 12'. E. long. 9° 14'.
CAGNACCI, in Biography. See Guido.
CAGNANO, in Geography, a town of the island of Corfica; 14 miles N. of Balia.
CAGNANO is also a town of Italy, in the kingdom of Naples, and province of Abruzzi Ultra; 3 miles N.N.W. of Aquila.
CAGNETE, Canete, or Guarco, a town of South America, in Peru, and capital of a jurisdiction of the same name, in the archbishopric of Lima, near the sea-coast; 80 miles S.E. of Lima. S. lat. 19° 40'. W. long. 73°.
CAGNETE, or Canete, a district or jurisdiction of South America, in Peru, beginning at the distance of 6 leagues S. from Lima, and extending along the coast in the same district above 30 leagues. The temperature of the air in this district is the same with that in the valleys of Lima; and the country, being watered by a large river, and other lesser streams, produces great quantities of wheat and maize. The lands are very much planted with cane, which yield an excellent sugar. In the vicinity of Chilca, situated above 10 leagues from Lima, is found salt-petre, of which gunpowder is made in that city. It has also a good fishery, which affords a comfortable subsistence to the Indian inhabitants of the town, particularly those situated near the sea-coast; together with plenty of fruits, pulses, and poultry; whence a large trade is carried on between this jurisdiction and Lima.
CAGNI. See Boufflers.
CAGNICOURT, a town of France, in the department of the Waits of Calais, and district of Baume; 3 leagues N.N.E. of it.
CAGNO, a town of Germany, in the country of Tyrol; 10 miles S.W. of Bolzano.
CAGNOLU, in Ichthyology. See Squalus Zygana.
CAGOTS, in Geography, a name distinguishing a singular class of people, who inhabit some of the valleys contiguous to the Pyrenees. M. Ramond de Carbonniere in his "Observations faites dans les Pyrenees," &c. £vo. Paris, 1789, adopts the opinion of M. de Marca, that this miserable race, whose imbecility of mind and deformity of person have so frequently engaged the attention, and exercised the ingenuity, of philosophical travellers, are the descendants of the Goths and Visigoths, who were exterminated and dispersed on account of their Arian principles. These heretics were treated with cruelty by the Franks, and driven from the borders of the Loire and the Sevre to the most desolate places. After the destruction of the kingdom of the Visigoths by the children of Clovis, those who were degenerated by intermixture, and were not able to follow the warlike Goths into Spain, sunk into contempt on account of their religious tenets. They were excommunicated from the church, and refused Christian burial. They were branded with the names of Cagots, Calas, and Cagnos, which signify, according to Gebelin, "polluted" and "infected." They became leprous, he says, by being, through successive generations, exposed to the most extreme poverty, and by being proscribed from intermarriages with any other families than their own. "Their return to the bosom of the church was not sufficient to remove the stigma of their cast: they ceased from being Arians, without ceasing to be leprous; and they afterwards ceased to be leprous, without being freed from all the evils engendered by a vitiated state of the fluids."
CAGUA, a district of Terra Firma, with a town of the same name, situated in the southern part of New Granada. The town lies in N. lat. 3°. W. long. 70°.

CAGUANABO, a town of the island of Cuba; 60 mile N.N.E. of St. Yago.
CAGUANICO, a town of the island of Cuba; 55 miles N.N.E. of St. Yago.
CAGUATUS, Marsilius, in Biography, born at Verona, about the middle of the 16th century, was educated at Padua, where he acquired so much reputation, that he was invited to teach medicine at Rome. He continued to reside there to the time of his death, in 1710. He was well read in the ancient Greek fathers of medicine, and employed much of his time in commenting on their works, and correcting many errors which time had introduced, often, Haller thinks, happily enough. His works are "Variorum Observationum Libri duo, cum disputatione de ordine ciborum Libri quattuor," Rome, 1731. £vo.; containing principally of critical observations on the works of the ancients. In one case, he had seen the bones of a human fetus which had been voided by the amns. "De Morti, Caussa Partum." He contends, contrary to an opinion held by some anatomists, that the utra pubis do not separate in parturition. "De Sanitate tuenda," 1791. £vo. "De Aetis Romani Salubritate, de Thiberis Inundatione, et de Epidemia Romana, seu de Popularib Epistolis quae anno 1592, et de altera quae anno 1593, orta fuit," 1799. £vo. He contends that the air of Rome is not unhealthy, and modern Rome more healthy than the ancient; that Rome abounds with persons of great age; that though the Tiber frequently overflowed its banks, he had never known any epidemic follow from that circumstance. Haller. Bib. Bot. Med. et Anatom.
CAGU! Minor, in Zoology, the name given by Marcgrave to the species of ape described by later scientific writers under that of Simia scudiet. Edwards after Marcgrave also calls it cagni minor, or fasciin. It is the thirteenth ape of Pennant.
CAGU! Major Brachilephus of Marcgrave is the Simia orbiculata of Gmelin, and little lion monkey of Edwards.
CAGURRIA, in Geography, a town of Spain, in Navarre, situated on a small river, which almost surrounds it, and discharges itself into the Ebro; 6 leagues N.W. of Calahorra.
CAHA, a town of Perdia, in the province of Irak; 40 miles N.E. of Amada.
CAHAIGUES, James, in Biography, born at Caen in Normandy, about the middle of the 17th century, applied early to the study of medicine, in which he took the degree of doctor at the university of Caen, in 1680. In 1683, he published "Eligiorum Civium Cademinentum Centuria," reprinted in 1699, 4to.; "Brevis Facilissimum Methodus curandarum Fœbrorum," Cadom, 1616. £vo. "Brevis Facilissimus Methodus curandorum Capitis Aetet."
CAHIER, or Cahie, in Geography, a small neat port and market town of the county of Tipperary, province of Munster, Ireland, where there is a bridge over the river Suir, and near it, on an island in the river, is a castle, formerly of great strength, which was twice taken, first by Sir George Carew in the reign of queen Elizabeth, and afterwards by Oliver Cromwell. On the bank of the river, opposite to the town, are the ruins of Cahier abbey, which was founded in the reign of king John. Distance S.W. from Dublin 85 Irish miles. N. lat. 52° 22' 32". W. long. 7° 54'.
CAHIR is also the name of a fishing village in the county of Kerry, Ireland, on the coast opposite to Valentia Island, which
which was formerly much frequented in time of war, because no French privateer ever landed there to plunder, as was usual on other parts of the coast; a privilege said to have been procured by the Roman Catholic bishop of the see from the French monarch, Smith's Kerry.

CAIRE, a small island in the Atlantic ocean, on the west coast of the county of Mayo, Ireland, a little south of the entrance into Clew bay. N. lat. 53° 44', W. long. 9° 53'.

CAHIRICONRE, a high mountain, south of Tralee, in the county of Kerry, Ireland, the name of which is supposed to signify the fount of King Con. On the top of it is a circle of mafly stones, laid one on the other, in the manner of a Danish intrenchment, several of them being from eight to ten cubical feet, but all very rude. Different opinions have been entertained respecting this and other ancient monuments of the same kind. Some suppose them to be of saxon origin, and designed for religious purposes in honour of the sun; while others maintain that they are of northern origin, and were monuments of some great action performed near the place, or perhaps a sepulchral trophy raised over some eminent person. Mr. Pinkerton, in his account of Stonehenge, supposes them to have been introduced by the Bege or Goths, whom he considers as the Irish Ptolemy. These people used them, he says, as circles of judgment, or solemn places where courts were held, of all kinds and dignities, from the national council down to the baronial court, or that of a common proprietor of land, for adjusting disputes between his vassals and slaves. According to this account they are of greater antiquity than the Danes, though used by this people. The common people, unable to conceive how human strength could possibly raise stones of such a prodigious weight to the summit of a steep mountain above 2000 feet high, get over the difficulty by supposing it to have been the work and labour of a giant. See Stonehenge. Smith's Kerry. Codettana Hibernica. Ledwich's Antiquities. Pinkerton's Geography.

CAHILLO, in Ichthyology, a name given by some old writers to the fish they also called lupus marinus, or wolf-fish, anarbebas lupus of Linnaeus.

CAHOKIA, in Geography, a settlement in the north-western territory of America, north of Kaskaflasias, which see.

CAHORS, a considerable town of France, before the revolution the capital of Quercy, and seat of a bishop, now the principal place of a district in the department of the Lot, situate in a vale between mountains on the bank of the river Lot. One part of the town seems to lean against the steep side of a mountain; the other is seated in a small plain, watered by the meandering stream of the river, and finely cultivated, with its corn-fields, gardens, and fruit-trees, particularly the almond. The town is irregularly built, and its streets are narrow. The cathedral church is distinguished by its large cupola, which mull in part have been an ancient Roman work; the remains also of a Roman amphitheatre and aqueduct are seen in this place. The number of inhabitants in the north and south districts of the town is 11,726, in the north canton 10,162, and in the south 8,564; the territory comprehends 143 1/2 kilometres and 10 communes. The lands round the town are very fertile; and the wine of this place has high reputation, and is exported from Bordeaux as an article of commerce. It is produced by dwarf or ground vines, on steep mountains, and holds a high rank among the red wines of France. This town is fortified and surrounded with thick walls; but it was taken by assault by Henry IV. in 1580, when mortars are said to have been first used. N. lat. 44° 27', E. long. 1° 6'.

CAHUSAC, Louis de, in Biography, was born at Montauban, and having finished his studies at Toulouse, was admitted an advocate. On his return to Montauban, he obtained the post of secretary of the intendance. He afterwards removed to Paris, and became secretary to the count de Clermont, and after attending him in the campaign of 1743, he devoted himself to literature, and particularly to dramatic compositions. He died at Paris in June 1759. His temper was reticent, lively, and arrogant; and his facility with regard to his reputation was so acute, that it is said to have produced a degree of derangement, which probably shortened his days. His publications were "Griggi," a romance, 12mo.; "The History of the Dance, ancient and modern," 3 vols. 12mo.; "Pharamond," written in 1726, and the tragedy of the "Earl of Warwick," two comedies, viz. "Zeneide," and the "Algerine," the "Fellivities of Polyhymnia," and of "Hymen," "Zais," "Nais," "Zorastre," the "Birth of Ophris," and "Anacreon," all operas; besides the "Loves of Tempe," which is also ascribed to him. Biog. Dict.

CAHUSAC, in Geography, a town of France, in the department of the Lot and Garonne, and district of Lauzun, and 5 miles E.N.E. from it.

CAHUSAC pur Verre, a town of France, in the department of the Tarn, and district of Gaillac, and 2 leagues N. of it.

CAHY, in Commerce, a dry meafure for corn, used in some parts of Spain, particularly at Seville and Cadiz. It is near a bushel of our meafure.

CAl, in Zoology. The Linnean Simia Midas is described under this name by Ray in his History of Quadrupeds.

CAJA, in Entomology, the species of Phaena, known in England by the name of the garden tiger moth. The anterior wings are whitish, with large fulcous spots: posterior pair red with black spots. Donov. Brit. Inf.

Caja, in Geography, a river of Portugal, which runs into the Guadiana, 7 miles E. of Elvas.

Caja, in Ornithology. Buffon gives this name to the hooped Parrot, Psittacus pileatus.

Caja, in the Turkish Military Orders, an officer serving in the post of a deputy or reward, and acting for the body of the janizaries.

CAIAC, in Geography, a town of Persia, in the province of Irak; 64 miles W.S.W. of Iphahan.

CAJANA, or Caianeborg, a town of Sweden in a lehn or district of the same name, and capital of Earl Bodin, seated on a lake near the borders of Lapland, and almost surrounded by the river Pyha, which forms a tremendous cataract in the neighbourhood. The district of which it is a part is about 60 leagues long and 16 broad. It was granted as a barony, in 1650, to Peter Brahe, under the title of the sef of Cajana. N. lat. 64° 15' 30'. E. long. 15° 50' 47'.

CAIANI, in Eccelesiological Antiquity, a sort of heretics, thus denominated from one Caius of Alexandria, their leader, otherwise denominated Aphantodocetse. The same name is sometimes also given to the sect of Cainians or Cainites.

CAIAON, in Geography, a kingdom of the island of Java.

CAIAPHAS, in Scripture History, the high priest of the Jews, at the time of our Saviour's crucifixion. He succeeded Simon, the son of Canithus, A.M. 4019, and after possessing this dignity nine years, till the year A.M. 4038, was deposed by Vitellus, governor of Syria, and the
C A I

the dignity devolved upon Jonathan, the son of Ananus. It appears that Caiaphas was high priest all the time that Pilate was in Judea. Some have thought, that the phrase, "being high priest that same year" (John, x. 49.) implies, that St. John supposed the high priesthood was annual. And on this account, they have been disposed to charge him with a great mistake; for Pontius Pilate was governor of Judea 16 years, and Caiaphas was put into the priesthood by Valerius Gratus, the predecessor of Pilate, and continued in it, till after Pilate's removal. But the phrase "that year," as it should have been rendered, and not "that same year," denotes no more than "at that time." St. John, therefore, merely says, that Caiaphas was high-priest at that time. It is added, that "being high-priest that year he prophesied." By prophesying we may understand his declaring the event; which it was in a peculiar manner the office of the priest to do, when he was inquired of, or when God was inquired of him, concerning any important matter under deliberation. Lardner's works, vol. i. p. 387, &c.

CAJARE, in Geography, a town of France, in the department of the Lot, and chief place of a canton, in the district of Figeac; 51 leagues E. of Cahors. The town contains 1775 and the canton 8126 inhabitants; the territory includes 207.5 square kilometres and 14 communes.

CAIATUS, in Botany, (Rumph. amb. iv. 64. t. 24.).

See Aeschynomena indica.

CAIACACOS, in Geography, a town of the island of Cuba; 40 miles W.S.W. of Bayamo.

CAJARDO, a town of Naples, in the country of Lavora, the seat of a bishop, suffragan of Capua, 8 miles N.E. of it.

CAIC, CAIQUE, CAICA, in Sea-language, is used to denote the skiff, or oolop, belonging to a galley.

The Caiacks give the same name, caic, to a small kind of bark used in the navigation of the Black Sea. It is equipped with forty or fifty men, all soldiers; their employment is a kind of piracy. The Turks have also a sort of caiacs, which serve as conveying by ferries.

The Caics, or Caiques, that navigate the sea of Marmora, are generally manned by two or three rowsers; and they are incessantly employed in crossing the harbour, and proceeding with celebrity to all the villages of the Bosphorus, to Scutari, to Prince's islands, and to every place in the environs. These caiques are long narrow boats, extremely light, equipped with one, two, or three pairs of oars, felled with four. They carry one or two, and even three fails, which are set only in fair weather, or when the wind is not too strong. They are not provided with ballast, and are so buoyant that a somewhat stiff breeze would over turn them, if the boatman did not take care to let go the sheet on the main left danger, and to throw the boat up in the wind by swinging the helm. These caiques are so numerous, and they divide the water with such velocity, that in some caiacs the utmost skill of the rowers cannot prevent their running foul of each other, and one of the two from being overet, especially in bad weather. Such accidents, when they occur, are little regarded. They are no lies swiftly in falling than elegant in their form. In two hours, with a light breeze, they will sail from Constan tinople to Prince's island, distant from 10 to 12 miles; and notwithstanding contrary wind and current, three rowsers never take more time for reaching Bucyl-Dere, distant 18 miles. The Caiques belonging to the Sultan are remarkable for their size, their gilding, their elegance, and the number and dexterity of the rowsers; they carry 14 pairs of oars, and are manned by 50 boatmen, dressed in white, the boatmen's-bachi being the cockswain, or steersman. The caique of the grand vizier has 12 pairs of oars; those of the principal officers of the Porte, and of the ambassadors of foreign powers, have seven pairs each. In these large caiques one man is required for each oar; while those of private perfns are sufficiently narrow for a single man to make use of two oars at a time. When the sultan in summer visits his different palaces on the Black sea, his caique is distinguished by a beautiful crimson awing, spread towards the stern; and he is preceded and followed by a number of others, in which are his principal officers.

CAICANDROS, or CAICANDRUS, in Ancient Geography, an island of the Parian gulf, 400 fathoms distant from Caeca, and before a place named Ilan, according to the journal of the navigation of Nearchus. It is mentioned also by Arrian. It was a small place and uninhabited.

CAICINUS, a river of Italy, in Brutum, near the Epizephryian Lucrians. It was near this river that the Athenians invaded the territory of the Lucrians.

CAICO, in Geography, a town of the island of Cuba; 25 miles S.E. of Bayamo.

CAICOS, or CAZOS, a chaffer of small islands or rocks, called Little and Great CAICOS, lying between St. Domingo, and the Bahama islands. N. lat. 21° 14' to 22° 23'; W. long. 71° 40' to 71° 50'.

CAICUS, in Entomology, a species of Sphinx that inhabits Surinam. The wings are fuscous; posterior pair rufous streaked with black; abdomen cincereous with black rings.

CAICUS, in Ancient Geography, a small river of Asia Minor, in Myria, which passed near the frontiers of Lydia, and uniting with other streams, discharged itself into the sea near Elea; supposed to be the present Gurnabli.

CAIDBEIA, in Botany, (Forb. Egypt.) See FOROCHLEIA.

CAJELI, or CAGELY, in Geography, a bay at the north-east end of the island of Bouro, where the Dutch have a fortress.

CAJELI, a country of Cilices in India, lying on the western shore of the island, towards the north, between Mandrar Mamoeck and Sidenie, which is the southermost place belonging to the government of Ternate. By the treaty of Boni, this country was added to the king of Ternate; but the government at Batavia afterwards issued orders that it should be considered as belonging to the government of Macaeer. It formerly yielded much cocoa-nut oil; but since the year 1730, it has been too much ravaged, first by the internal difensions between their own nobles, and afterwards by the Mandarares, that all the cocoa-nut trees were felled; and the land lies now almost uncultivated and desert, and is subject, for the greatest part, to the Mandarares.

CAJEPUT OIL, Oleum Volatile Melaleuca. This essential oil is prepared from the dried leaves of the Melaleuca Leucadendron, a tree which grows abundantly in many of the Molucca islands. The oil is brought over in considerable quantity from Ambon, Batavia, and other Dutch settlements.

Cajepot oil is a very limpid fluid with a slight green tinge, lighter than water, of a very penetrating and peculiar flavour, somewhat resembling a mixture of ether and camphor, totally evaporable in a moderate temperature when exposed to air, very inflammable and burning without leaving any residue. In chemical qualities it resembles the other essential oils.

To the taste, it is highly acid and stimulating, and it appears to possess valuable medicinal properties as a general stimulant.
Amulut and antispasmody. Hence it is warmly recommended in flatulent colic, paralytic chorea, hooping cough, and convulsive disorders in general. The dose is from one to six drops. It is also of considerable use externally applied for the relief of tooth-ache, rheumatic pains, lprains, and the like. This oil was first introduced into the Amsterdam Pharmacopoeia about the year 1726, and is retained in the last edition of that of Edinburgh.

Infects have a great aversion from this oil, the vapour of which appears to intoxicate and kill them. A peculiar property of cajuput, in which it excels other essential oils, is, that it is a perfect solvent of castor-oil, from which a perfect drying varnish may be made in the manner described under that article.

Caiet, or CAYET, Peter Victor Palma, in Biography, was born in 1523, of poor Protestant parents, at Montelich in Tournai; and after pursuing his theological studies at Geneva, became a domestic in the house of Calvin, and afterwards a minister. However, he left his church to follow the court, and was appointed chaplain to Catherine, sister of Henry IV.; but being addicted to alchemy, he was calumniated as a magician, and charged with publishing a book in favour of the establishment of public fews; and deposed from his ministerial function by a synod. Thus disgraced, he abjured Protestantism, in 1595, and was cordially received by the Roman Catholics, among whom he was ordained priest at the college of Navarre, and made doctor in theology, and appointed royal professor of Hebrew. His zeal, as a new convert, led him to attack the sect he had abandoned in several controversial writings, and in a dispute with Du Moulin. But his principal reputation was founded on his historical compilations. In 1598 he published a relation of the recent war between the Turks and Hungarians; and, in 1605, his "Septenary Chronology," from the peace of Vervins, in 1598, to 1603, to which he afterwards added the history of the nine years' war, terminated at this peace, in his "Novenary Chronology," printed in 1608. He also wrote two works in Latin; one intitled, "Concilium plumin de componendo Religionis Diffludio," and the other, "Instructions in the four principal Oriental Languages." He died in 1610. Gen. Diet.

Cajeta, in Entomology, the name under which Cramer figures the Gmelinian Noctua Follomica, which he described.

Cajeta, in Ancient Geography, a sea port town of Italy in Latium, now Geta.

Cajetan, Cardinal, in Biography, so called from the place of his nativity, Cajeta, (his proper name being Thomas de Vio,) was born in 1469, and entered into the order of Dominicans, among whom he was distinguished for the acuteness of his understanding and his learning. The chapter of his order conferred upon him the degree of doctor in 1494; and after having taught philosophy at Rome and at Paris, he was chosen general of his order in 1508, and raised to the dignity of cardinal in 1517, by Leo X. In the following year he was deposed as legate to the emperor, for promoting the war against the Turks and opposing the Lutheran heresy. At this time he held three conferences with Luther at Augsburg, in the conduct of which he behaved in a manner so imprudent and imperious as to give offence at the court of Rome. Instead of recurring to argument, he used the mere language of authority, and in an overbearing tone infiltrated on the reformer's giving up his opinions and submitting respectfully to the judgment of the Roman pontiff. Luther's temper could not brook such treatment, and of course the breach was widened by these conferences. Pope Adrian VI. sent him as his legate to Hungary, and upon his return he was promoted to the see of his native city. When Rome was sacked in 1527, he fell into the hands of the soldiers, by whom he was treated with great indignity, and they inflicted on a large sum for his ransom. He closed his life at Rome, where he was admirably employed in the study of the Scriptures, in 1544. His earlier works were "Commentaries upon Aristotle," and upon the "Summa Theologica" of Aquinas. In his "Tractatus de Comparatione Authoritatis Papae et Concili," he alleges many frivolous and groundless arguments in favour of the absolute authority of the popes as successors to St. Peter. His theological treatises discuss the most important tenets of the Roman Catholic religion; and in his illustration of the doctrine of indulgences he maintains that they are valid as an abridgment from the penalties enjoined by the church, but that their benefits extend to souls departed merely in the way of suffrage or intercession. With respect to indulgences he contended, in his conference with Luther, that "one drop of Christ's blood being sufficient to redeem the whole human race, the remaining quantity that was shed in the garden and upon the cross, was left as a legacy to the church, to be a treasure from whence indulgences were to be drawn and administered by the Roman pontiffs."

Cajetan's most considerable work is his "Commentary upon the Scriptures," comprehending the Old and New Testament, except the Song of Solomon, the Prophets, and the book of Revelation. In this performance, he restricted himself to the literal sense of the words Scripture in the original languages, without regarding the explications of the fathers. Ignorant of the Hebrew, he employed a Jew and a Christian to furnish him with the exact import of the words according to the letter and grammar, without troubling themselves to give a sense of their own when no sense appeared. In the New Testament he chiefly followed the version of Erasmus. By deferring the vulgar Latin translation, and disregarding the fathers, he incurred the censure of some of his own communion; and, in 1544, the university of Paris inflicted a decree, condemning his work, as containing false, impious, and even heretical propositions. Some more candid Catholics have vindicated him, though he is justly charged with too perfunctorily adhering to the literal version of the rabbins. Many editions of his works have appeared. The whole of the Scriptures were printed at Lyons, in 1539, in 5 vols. fol. Dupin's E. H. 16th century, Molinm's E. H. vol. iv.

Cai-Fong, in Geography. See Kai-Fong.

Cailar, a town of France, in the department of the Herault, and chief place of a canton, in the district of Lodève. The town contains 722, and the canton 3127 inhabitants: the territory comprehends 255 square kilometres, and 8 communes.

Cailhaud, a town of France, in the department of the Aude, and district of Limoux; 3 leagues S.W. of Carcassonne.

Callie, Nicholas Lewis de la, in Biography, an eminent mathematician and philosopher, was born at Rumigny, in the dioce of Rheims, March the 15th, 1712. The amusements of his father, after withdrawing from the army, in mathematical and mechanical philosophy, led the son, at an early period, to form an attachment to mechanics. Having left school in 1729, he prosecuted his studies at Paris, and applied particularly to theology, in the college of Navarre, with an intention of becoming an ecclesiastic. But his inclination to astronomy diverted his purpose; and, by the friendship of the celebrated Cassini, to whom he was introduced,
CAI

introduced, he obtained an appointment in the observatory; and under the influence of this excellent patron, his natural genius had favourable opportunities for cultivation and exercise, and he acquired the reputation of an able astronomer. In 1739 he was connected with M. Caillet de Thury, in verifying the meridian through the whole extent of France; and in the same year he was appointed professor of Mathematics in the college of Mazarine. In 1741 he was admitted into the Academy of Sciences, and from this year to 1763 inclusive, he enriched every volume of the memoirs with some valuable paper. He also published, at different periods, some useful treatises on geometry, astronomy, mechanics, and optics. He also computed all the eclipses of the sun and moon, from the commencement of the Christian era, which were printed in the work intituled, "L'Art de verifier les Dates," Paris, 1756, 4to. He also composed a volume of "Almanach Ephemerides," for 10 years, from 1745 to 1755; another from 1755 to 1765; and a third, from 1765 to 1775. His excellent work, intituled, "Almanach Fundamenta, novissimi Solis et Stellarum Observationibus stabiles," was published at Paris in 1739; and in 1760 appeared his correct solar tables, under the title of "Tabulae solares, quas ex novissimis observationibus deduxit," N. L. de la Caille.

Having completed a series of seven years' observations in the observatory at the Mazarine college, he formed a project, which was approved by the French court, of observing the southern stars at the Cape of Good Hope; and proceeded upon this expedition in 1750. In the space of two years he observed the places of about 10,000 stars in the southern hemisphere, invisible in our latitude; and determined several other important elements, such as the parallaxes of the sun and moon, and of some of the planets, the obliquity of the plane of the ecliptic, the quantities of refraction, &c. Previous to his return he engaged in the arduous attempt of estimating the dimensions of the earth by measurement, at the southern parallels, as other astronomers had done near the equator, and in northern latitudes, with a view of deciding whether the former corresponded with the latter. The results of his labours were satisfactory; for having determined a distance of 430814 feet from a place called "Klip-Fontyn" to the "Cape," by means of a base of 35862 feet, three times actually measured, he discovered an unknown secret of nature, viz. that the radius of the parallels in southern latitude are not of the same length with those of the corresponding parallels in north latitude. He found that a degree on the meridian in 32° S. lat. contains 3422 2 Paris feet. In conformity to orders from the court of Versailles, he also determined the situation of the Isles of France and Bourbon. During his abode at the Cape he likewise made some curious meteorological observations; and he particularly observed, that when the south-eaft wind blows, which is often the case, the stars appear larger and seem to dance; that the moon has an undulating tremor; and that the planets have a sort of beardlike comets.

Upon his return to France, after an absence of 4 years, he replied to some criticisms published by the celebrated Euler, relating to the meridian: he afterwards settled the results of the comparison of his own observations, respecting the parallels, with those of other astronomers. Accordingly, he fixed that of the sun at 50°; that of the moon at 50° 56', that of Mars, in his opposition, at 56°, and that of Venus at 38°. He also settled the laws, by which astronomical refractions are varied by the different density or rarity of the air, by heat or cold, and by dryness or moisture. And he was one of the first promoters of the lunar observations for determining the longitude at sea. In consequence of the reputation which he had thus acquired and established, he was elected a member of most of the academies and societies in Europe: as London, Bologna, Peterburgh, Berlin, Stockholm, and Gottenburg.

Independently of his own publications, he edited the memoirs of Father Feuille, at the Canaries; the journal of the voyage of M. de Chazelle, to the Levant; the manuscript collection of observations of William, Landgrave of Heffe, and Bouger's tracts on the gradation of light.

Although he was attacked in 1760 with a feverish fit of the gout, the energy of his mind was unimpaired; so that besides pursuing his course of studies, he sketched out the plan of a new and large work, proposed to be "The History of Astronomy through all Ages, with a Comparison of the ancient and modern Observations, and the Construction and Use of the Instruments employed in working them." In the year 1761 his constitution gradually declined, without interrupting his studies, in which he persevered to the last: and they only terminated with his life, March 21st, 1762. Mem. of the Paris Academy for 1762.

CAILLE, in Ornithology, among the French, synonymous with the English word quail, as for example, "caille de la Louisiane" of Buffon, the Louisiana quail of Latham; "caille de la Chine" of Buffon, the Chinese quail of Edwards; "caille de l'isle de Lucon" of Sonnet, the Luzonian quail of Latham, &c.

CAILLERE, la, in Geography, a town of France, in the department of the Vendée. 45 leagues N.E. of Lucon.

CAILLOT, in Biography, a most pleasing, theatrical French singer, to the natives of other countries, that France has produced. He continued, during many years, the favourite actor and singer of the comic opera at Paris. His voice, which he could make a base, tenor, or counter-tenor at pleasure, was sweet and flexible. He was an excellent actor, and, in all respects, a most interesting, entertaining, and admirable performer. He first appeared in the part of Colas, in Ninette à la Cour, in 1760.

CAILLY, in Geography, a town in France, in the department of the Lower Seine, and district of Rouen; 32 leagues N.N.E. of Rouen.

CAULO, a small islad in the gulph of Perhia, 80 leagues W. of Ormus.

CAIMACAN, or Caimacan, a dignity in the Ottoman empire, answering to that of lieutenant, or vicar, among us. The word is composed of the two Arabic words, "Caim macan," q. d. he who holds the place, or discharges the functions of another.

There are usually two caimacans: one resides at Constantinople, who is the governor thereof: the other attends the grand vizir, in quality of his lieutenant. Sometimes there are three caimacans: one constantly attending the grand vizir, another the grand vizir, and a third constantly at Constantinople, who examines affairs of policy, and regulates them in great measure. The caimacan that attends the vizir, only officiates when at a distance from the grand vizir; his function ceasing, when the vizir is with the sultan. The caimacan of the vizir is his secretary of state, and the first minister of his council. The caimacan is properly the substitute of the grand vizir, appointed by the sultan, when the latter is absent himself in order to take command of the army. The caimacan discharges his functions, invested with the same authority, enjoys the same rights, but not the same revenues; his salary is fixed, and the emoluments of the place belong to the vizir, to whom the caimacan renders an account of them. It generally a pacha or bashaw.
Cain, in Geography. See Caipman.

Cainmen. See Caipmen and Hiera.

Cain, derived from Γενις, to acquire, and denoting acquisition or possession, in Scripture History, the eldest son of the progenitors of the human race; Adam and Eve, was born towards the end of the first year of the world, B. C. 4003. From the concise history of Cain that occurs in Genesis, ch. iv. we learn, that he devoted himself to husbandry, and his brother Abel, to the keeping of sheep; that when they brought their respective offerings to God, that of Abel was accepted, and that of Cain rejected; that this preference enraged Cain, exciting in his mind jealousy and envy of his brother; and that the indulgence of these wicked passions at length terminated in the murder of his brother. As a punishment of this atrocious crime, God condemned him to be a fugitive and vagabond on earth, and to till an ungrateful soil, which should not recompense his labour with the plenty and incares he had before experienced. Nevertheless he set a mark upon him, or gave him a sign, that none might take away his life in his wanderings. Many ridiculous conjectures have been made both by Jews and Christians concerning this mark. Some have supposed that God signified him with a brand in his forehead, to denote his being accursed; others, that he had a wild aspect and bloody eyes, which rolled in a horrid manner. The fathers, in general, apprehend, that he had a continual trembling of the body, so that he could hardly get his food to his mouth; and this opinion is favored by the LXX, which renders "a fugitive and a vagabond" (κύρος καί ἄστρος), lamenting and trembling. Others say, that wherever he went the earth shook under him; and others again intimate, that he had a horn growing out of his forehead, to warn people to avoid him; and others have indulged him with the sign of the crofs. Le Clerc imagines, that God ordered him to wear some distaffineshing garment, perhaps of some glaring colour, as a mark or sign upon him for his preservation. To these fanciful conjectures we may add a more probable opinion of Dr. Shuckford (Conn. vol. i. p. 8), who renders the words מְצֹא יַעַרְנָא יְהֵן as "God gave to Cain a sign," or token, probably by some apparent miracle, that he would providentially protect him; so that none that met him should kill him. In this sense the word מַעַרְנָא is used, when the rainbow is called the מַעַרְנָא, that is, the sign, or token, of the covenant which God made with Noah, affuring him that he would drown the world no more. (Gen. ix. 12-17.) See also Judg. vi. 17. Pfalm, lxxxvi. 17. Dr. Geddes (Crit. Rem. vol. i. p. 59.) translates the words above cited, "and the Lord gave a token of security to Cain," and he observes, that the original cannot admit of the common interpretation, as there is not a single passage in the Bible where מַעַרְנָא signifies a mark or brand let on one. It always denotes a sign, a token, a wonderful event; but never a mark. And although מַעַרְנָא signifies to place or set, it has often a meaning like that of מַעַרְנָא; and מַעַרְנָא is here equivalent to מַעַרְנָא, and such is its signification wherever it is connected with the word מַעַרְנָא.

Pr. lixv. 4. lxviii. 43. ev. 27. lix. 10.

Cain at length settled with his wife and family in the land of Nod, on the coaft of Eden, where he built a city, calling it after the name of his fons, Enoch. But Josephus says (Ant. l. 1. c. 2.) that instead of being reformed by the punishment inflicted on him, he became more wicked and violent, and headed a band of thieves, whom he taught to acquire riches by oppression and robbery. He is said to have corrupted and changed the simplicity and honesty of the world; and to have invented weights and measures. He was also the first who set bounds to the fields, and who built and fortified a city.

Cainman, the son of Enos, was born A. M. 1215, B. C. 3679, Enos being 90 years of age. Gen. v. 9. At the age of 70 he begat Mahaleb, and died at the age of 910 years, A. M. 1235, B. C. 2769.

Cain was also the fons of Arphaxad, and father of Salah, whose name does not occur either in the Samaritan or Hebrew text, nor in any of the ancient versions of Gen. xi. 12, &c. except the LXX; and hence it has been generally deemed an interpolation. The name, however, occurs in the genealogy of Chrift, Luke iii. 36, between Salah and Arphaxad. Dr. Jackson, in the first volume of his "Chronological Antiquities," labours hard to shew, that the reading of the LXX is the true original reading, and that it flowed in the original copies till after the Christian era. It must be acknowledged, that it is not easy to determine by what means it could have got into the Septuagint version, if it had not been found in their Hebrew copy; and it is certain, that it must have been in the copy used by St. Luke in forming his genealogy of Christ. It is not easy to conceive, how fuch an interpolation could have been made, or for what purpose; whereas its having been dropt out of the Hebrew text may be readily accounted for. On the other hand, the conformity of the Samaritan with the Hebrew copies, the silence of Josephus and Philo, and its omission in the chronological computations of Julius Africanus, Eusebius, and Tholusius, are urged as cogent proofs that the passage was not in the original copies of the Septuagint; and Grotius even afferts, that it was not to be found there before the 4th cent. But it may be asked, how came it to be inserted? To which it is replied, that it was foituted into St. Luke's gospel by some careless copyist from ver. 37, where it rightly occurs; and this interpolation, being transferred by other copyists, got imperceptibly into almost all the exemplars; and, on these exemplars, the copies of the LXX were next interpolated, in order to make them agree with the evangelist. This indeed, though not an impossible, is certainly a strange, rapid, and almost incredible process. For we find the fame interpolated Caipman in the Syriac, Vulgate, Arabic, and Ethiopic versions. Upon the whole there is reason for inclining to the opinion, that the comma in question flowed originally in the Septuagint version, and that Luke drew his genealogy from that version. After all, it is a point, in its connection with Biblical criticism, of no great moment, as the design of the evangelist was only to present us with the genealogy of Christ in its ascent to Adam, which is equally clear, whether we reckon Salah as the immediate descendant of Arphaxad, or whether we consider him as his grandson by Caipman. We must not, however, omit to mention, that the comma is wanting in three of Holme's MSS. in the Coptic (which indeed has Caipman, but makes him one of the fons of Shem, and places him after Aram), and Armenian, edited copies, and in one Arab. MS. Nor was it read by Theophilus; nor by Jerom in his Heb. Questions: where he expressly says, "Arphaxad genuit Sala."

Caipnites, or Caipniates, in Ecclesiastical History, a sect of ancient Gnostics, that sprang up towards the close of the second century, and paid extraordinary honours to those perfons represented in Scripture as the worft of mankind; so called from Cain, whom they esteemed their patriarch, and the chief object of their veneration. They held that Cain, Eilaw, Core, Dathan, and Abiram, and thofe of Sodom, were born of a moft eminent celestial virtue; that Abel,
Abel, on the contrary, was born of a virtue much less eminent: to Cain, and others of the same order, who, according to them, had a mighty knowledge of all things, they associated Judas, whom they held in so much esteem, that they had a book among them called the gospel of Judas. S. Epiphanius, who seems to have borrowed his account from Ireneus, relates, and at the same time refutes, their errors.

Ireneus and Epiphanius concur in their accounts of the gross errors and atrocious wickedness of these people. Dr. Lardner, however, disputes the credibility of their relation. The wickedness ascribed to them, he says, is incredible; as it is not easy to conceive, that any number of persons calling themselves Christians should honour Cain, Core, and Judas, and all who lie under just condemnation in the scriptures, both of the Old and New Testament, for the most notorious wickedness; and besides, the account is inconsistent with itself; for it is not possible that men should be extremely wicked in principle and practice, and at the same time he concerned about the salvation that is by the crofs of Christ, and honour Judas for his love of truth, and solicitude for the salvation of the world and the general good. Moreover, the rife of this denomination of Cainites may be accounted for another way, without making a particular feat. It might arise from the SETHIANS, those who called themselves by that name, and extolled their ancestor Seth. Could not well avoid declaiming against Cain; and they might sometimes lay of those in a different course of life from themselves, that they acted as if they were the children of Cain, who was of the evil one; and deemed to shew themselves kindred of Core, and Dathan, and even Judas himself. From this circumstance, or mode of speaking, some persons, who were diffused to multiply heresies, took occasion, or by mistake were led to talk of a sect under the denomination of Cainites.

CAINO, in Botany (Prof. Gen. 12. ic. 69.). See CHRYSOPHYLLUM CAINIO.

CAINO, also, the new court, in Antiquity, a civil court of justice at Athens, sometimes called παρείσχον παραγώ, which took cognizance of trifling matters, not exceeding in value one drachm. The judges in this court were the eleven magistrates. See ATHENS.

CAINS, in the island of Cauda, denote Greeks revolted, and retired to the Venetians, either at Suda or Spinna Longa; who, in time of war, burn, pilage, and commit all manner of cruelties on their ancient brethren under the Turks. When a Cain, or false brother, is taken, there is no mercy for him; they either impale him, or put him to the ganeche.

CAINUM, in Ancient Geography, a town of Asia, in Mesoopotamia. Not Imp.

CAJORI, in Geography, an isle near the mouth of the Ganges, at the bottom of the bay of Bengal, on the west side of the river.

CAJORI, CASHEW, or CASU. See ANACARDIUM.

CAIPHA, CAIPHA, or HEPHA, in Ancient Geography, a town at the foot of Mount Carmel, to the north, on the gulf of Poilemais; its ancient name was Sycaminos, or Portophyron. It was separated from Aco, or Polemais, by a large and beautiful harbour. The distance from Aco to Caipha, or Capha, by sea, is not above 15 miles; but it is twice as much by land.

CAIPA, in Geography, a river of South America, which runs into the Orinoko, or Orinoc. N. lat. 7° 16’. W. long. 65° 1'.

CAIRINA, in Ornithology, the Mufcovy duck, Anas Moschata, according to some authors.

CAIRN. See CArn.

CAIRNEY, in Geography, a town of Scotland, in Aber.

Vol. V.
CAIRO.

In the year 572 of the Hegira, A.D. 1176, he built the walls that encompassed Grand Cairo, and the citadel on Mount Mokattam. It is said to be about 224,000 cubits (3 leagues) in circumference; 1/4 league from north to south, or, according to Browne’s estimate, about 1700 yards, and 2 of a league from east to west. To the south-east and south of Grand Cairo is a ridge, called Mokattam, of the extensive chain, which runs along the course of the Nile to Upper Egypt, sometimes receding and leaving a plain about a league broad, and at other places opposing its barrier to the stream. This mountain is totally without verdure, and presents nothing to the eye but a dry land and insensibility calcined by the sun, which, of course, reflects a suffocating heat upon the town, whenever the northern wind does not blow. To the north of the city a plain extends to the Delta, which it resembles in flat and productions. Immediately under the mountain is the castle, now incapable of defense, though conceived of great strength, before the invention of artillery. As it is commanded by the neighbouring mountain, it could not furnish a battery from thence for two hours. It is more than a quarter of a league in circumference; and the sea-coast to it is by two very deep passages, cut out of the rock on which it stands, which lead to two gates, entwined to the guard of Alkins (no longer existing) and Janizaries. The former occupied the lower part of the fortres, and the others, the part called the citadel. The interior of the castle contains the palace of the sultans of Egypt, almost buried under their ruins. In one of the halls of these ruined buildings, exhibiting only some shattered remains of their ancient magnificence, is fabricated the rich carpeting, or embroidered cloth, which the Emir Hagg, or hey, who is prince of the caravan, carries every year to Mecca, for the purpose of covering the Caaba. The pacha’s apartments in the castle are mean and incommmodious; the audience-hall, where the divan is held three times a week, is a long room stained with the blood of the boys, sacrificed by order of the Porte. At the extremity of the place called “Cora Midan,” is the mint (the only one for Egypt), where they coin gold mabubis, and half-mabubis, the first being worth about 5 shillings each; and in copper washed with silver the small coins worth about a half-penny, called in Turkish “paras,” in Arabic “diwani,” “fudda,” or “madi;” and by European writers, “afrers,” and “medines.” On one side is the name of the reigning sultan, and on the reverse “Mifs,” and the date. The sequins are worth about 6s. 3d. English, and are made of the gold-dust brought from Abyssinia, which furnishes annually upwards of four millions. One of the most curious monuments in the castle is the “Well of Joseph,” hewn out of the rock, which, according to Pococke, was sunk about 700 years ago by a virth, called Joseph, by order of sultan Mahomed, son of Calaoun. The Egyptians ascribe it to Salah Edin. It is hardly necessary to observe, that fabulous tradition attributes it to Joseph the patriarch, whose palace this castle is said to have been. The well is 280 feet deep, and 42 in circumference. A hair-cake of gentle defiant winds round it. Within this well, at a considerable depth, is an esplanade with a bason; where oxen turn the wheel that raises the water from the bottom of the lower well; other oxen, placed above, raise it from this reservoir by the same mechanism. The water proceeds from the Nile, and, as it filters through a sand impregnated with salt and nitre, it is brackish. From the façade of the palace of Salah Edin, situate in the quarter of the Janizaries, and exiling only in ruins, the view extends over an immense horizon, including the whole extent of Grand Cairo, a multitude of mosques and minarets, the river, and on the side of Boulac, a rich country covered with her- vaets, and interpersed with groves of date-trees. Maftufat appears to the south-west, and the plains of the Said, or Upper Egypt, when overflowed by the Nile, present to view different hamlets, built on eminences, now converted into islands. The landscape is terminated by the pyramids, which, like the tops of mountains, lose themselves in the clouds. This isle commands the town, which forms an immense crescent around it. The streets of this famous city are narrow, crooked, and unpaved, intersected here and there with huge vacancies, which become lakes during the incresce of the Nile, and are gardens during the roll of the year. In the month of September they are passable by boats; but in April they are covered with flowers and verdure. The narrower of the streets, however, affords protection from the fierce effulgence of the meridian sun.

The “Chalige,” “Khlag,” or canal, which traverses Grand Cairo from north to south, and which is opened every year with great solemnity, takes its rise near Mafr El Artike, or Foslat, fills the lakes of the city, and leaves itself four leagues beyond it, in the “Borgue” (large piece of water,) of the pilgrims of Meccas. Mr. Shaw calls this the canal of Trajan. Pococke, and other modern writers, ascribe the construction of it to this emperor; and it has been commonly ascribed to “Amnis Trajanus.” Macrili says it was built by the emperor Adrian. Elmacin, cited by Savary, says, that this grand project was executed by Amron, who, having announced the capture of Alexandria to Omar, received instructions to cut a khlag, by which the produce of Egypt might be transported into the sea of Columbus (or Red Sea), and from thence to the port of Medina. It was called “the river of the prince of the faithful!” and boats, passing from Foslat, conveyed the commodities of Egypt into the Red Sea. Through the negligence of succeeding caliphs it has been choked up, so that it no longer conveys its waters to the Red Sea. By opening this important communication with the Red Sea, a project which engaged the attention of Bonaparte during his short abode in Egypt, Grand Cairo would again become the richest and most commercial capital in the world. For a further account of it, see Canal. At different feasons of the year, this canal, in its pallahage through Cairo, assumes various aspects; but its most permanent character is that of a dung-hill, or public receptacle for all kinds of offal. Before the rise of the Nile, it is cleaned, and becomes a street; it is then filled by the incresce of the river, and exhibits the appearance of a canal covered with boats. The kites thrice wildly over this canal; and the city is infested with its usual herds of dogs; while the turtle-doves, unloastened by men or children, breed in the houses, building their nests under the projecting beams.

The principal street of Cairo runs parallel to the “Chalige.” And on this canal are all the houses of the Europeans, notwithstanding the French that proceeds from it, and is said to produce the pestilence, to which, however, that order of men is leaft subject. Within the walls of Grand Cairo are more than 300 mosques, most of which have several minarets, or high fleeples, of a very light architecture, and surrounded with galleries. These elevated structures give to the city an agreeable variety, which would otherwise appear too uniform, on account of the flatness of the roofs, all of them being in the form of terraces; and they seem, also, to accommodate the public criers, who call the people to prayers at the hours prescribed by the Mahometan law. About 800 voices may be heard at the same instant in every quarter of the town, reminding the people of the seafons of devotion.
The population of Cairo consists of the Arabs, or lower classes of Mahometans, who form the body of the people; of the Coptic Christians, who are numerous; of Mamlukes, whom Browne estimates at no more than 10 or 12 thousand; of Greeks, Syrians, and Armenians; and of Magyars, from Tripos, Tunis, and Morocco, to whom an appropriate quarter is assigned, who are remarkable for industry and frugality, and are attracted hither by the great profits of trade. Besides those above recited, there are other Mahometans from Arabia Proper, and countries farther east. There are few Turks who are permanent inhabitants, but they occasionally resort hither on business, and return to Constantinople. Jews were once numerous; but they are now on the decrease. Exclusively of negro slaves, every house, there are blacks from Nubia, who act as porters at the gates of the rich, and sometimes fell eunuchs. It is not easy to calculate the precise amount of the whole population, because the Turks have no registers of births, deaths, or marriages; and if the number of houses were known, it would furnish no sufficient datum for computing the number of inhabitants, as in Egypt a large proportion of the people have no visible dwelling. Baron de Tott states the whole number at Cairo, and the adjacent port Boulac, on the authority of an officer of the customs, at 700,000; and Volney, admitting with Niebuhr, that the circumference of Cairo is 3 leagues, and comparing it with Paris, after proper allowances, estimates the number at 350,000. Browne thinks it cannot be less than 300,000. The women of Cairo are, in general, well-formed, but not tall. Those of the upper ranks are tolerably fair, in which quality, and fatness, confide the chief constituents of beauty in the Egyptian climate. They marry at 14 or 15, and at 20 are passed their prime. The Coptic women have interesting features, large black eyes, and a genteel form. See Copts.

Life at Grand Cairo, says Savary, is more a passive than an active existence: the body during nine months of the year being oppressed with excessive heat, and the mind partaking of this state of indolence. The Mamlukes breakfast before fun-rife, make their second meal at ten, and the third about five in the afternoon. They have plenty of animal food, and in the middle of the table appears a large dish of pilau, surrounded with small dishes of meat, fish, and fowl. Before they dres their meat, they cut it in small pieces. Their drink is water, which is brought from the Nile into the houses, and put into jars, called "hamman," previously rubbed in the inside with a kind of pale, made of bitter almonds. Thus preferred, it becomes quite clear and limpid in two hours. But it is often drank in its muddy state, without any ill effects. After the meal, coffee is served; and at the tables of the great thorough is introduced. A fermented liquor made of maize, millet, barley, or rice, pleasant to the palate, but in the hot season spoiling in the course of the day, is drank at Cairo, as well as in Said, in considerable quantities. The native Chritians mostly difil for themselves, from dates, a liquor called by the general name of "araki," it is also made from currants, or the small grapes imported from Cerigo.

The principal dishes to which the inhabitants of Cairo are subject, are defluxions in the eyes, sometimes terminating in blindness; the disorder called by the vulgar the "blest evil," or Neapolitan discale, as the syphilis has been sometimes improperly called, hydrocele, malignant fevers, and the plague.

Among the amusements of Cairo, we may mention its dancing girls, (see Alem) and rope-dancers; its chief games are chess, and Polish drafts; on solemn occasions, fire-works are exhibited; and on Friday, a mafs without the walls is frequented by the ladies as a pilgrimage of pleasure. Parties are also formed for failing in light boats, like Venetian gondolas, on the incres of the Nile.

Before the discovery of the passage to India by the Cape

of
of Good Hope, the commerce of Cairo was very extensive; but though it has since declined, this city may still be regarded as the metropolis of the trade of eastern Africa. As Tripoli chiefly possesses that of the west. From Yemen are imported coffee, oodours, gems, and some useful drugs; from Susat, and other neighbouring parts of India are obtained muslins, and various articles of cotton manufacture; from Ceylon, spices; and shawls from Calahire. A few slaves are brought from Abyssinia by the way of Jidda and Mecca. Caravans passing to and from Senaar, Darfur, and Fezzan, bring slaves, gold-dust, ivory, horns of the rhinoceros, ostrich feathers, guns, and drugs. See CARAVAN. From Tunis and Tripoli are brought oil, red caps, for which Tunis is famous, and fine flannel; from Syria arrive cotton, silk, soap, tobacco, and glass beads; from Constantinople they obtain white flaves, male and female, and all kinds of brass, copper, and iron manufactures. Numerous negro slaves pass from Cairo to the more northern Mahometan countries.

"Two powerful cauæs," says Volney, "have contributed to render Cairo the seat of an extensive commerce: the first of which is, that all the commodities consumed in Egypt are collected within the walls of that city; and all the persons of property, that is, the Mamelukes and lawyers, are assembled there, and draw thither their whole revenues, without making any return to the country from which they receive them. The second is the situation, which makes this city a centre of circulation, while, by the Red Sea, it corresponds with Arabia and India; by the Nile, with Abyssinia and the interior parts of Africa; and by the Mediterranean, with Europe and the empire of Turkey. Every year, a caravan from Abyssinia arrives at Cairo, and brings from 1000 to 1200 black flaves, as also elephants' teeth, gold-dust, ostrich feathers, guns, pumice-stones, and monkeys; while another, defined for Mecca, leaves the extremities of Morocco, and receiving pilgrims, even from the river of Senegal, coasts along the Mediterranean, collecting thofe of Algiers, Tripoli, and Tunis, and arrives by the defeat at Alexandria, consisting of not less than three or four thousand camels. From thence it proceeds to Cairo, where it joins the caravan of Egypt. They then jointly set out for Mecca, whence they return one hundred days after."—"The lading of these caravans consists in India rubs, shawls, guns, pearls, perfumes, and the coffee of Yemen."—"The same commodities arrive by another route at Suez, to which port the fouterly winds bring, in May, 26 or 28 fail of veffels from Djiedda. Small caravans also arrive from time to time from Damasæus, with silk and cotton rubs, oils, and dried fruits. Besides, "there are always some veffels in the road of Damietta, unloading hogheads of tobacco from Latakia, the consumption of which in Egypt is enormous. These veffels take rice in exchange, whilst others arrive successively at Alexandria, bringing clothing, arms, furs, fias, and wrought silk, from Constantinople. Veffels come likewise from Marfelles, Leghorn, and Venice, with cloths, cochineal, Lyons' rubs and faces, grocery, paper, iron, lead, Venetian fequins, and German dollars. All these articles conveyed by fea to Rosetta in barks called "djem," are first landed there, then remarked on the Nile, and sent to Cairo. From this account, it appears, that we need not hesitate to admit the report of the commissioner general of the eunuchs, who afferted, that in 1783, Cairo had traded to the amount of near 150 millions of livres, or fix millions 250 thousand pounds sterling.

Among the manufactures are fugar, of a bad quality, alf ammoniac, which is very good, glasses, lamps, salt-petre, coafe gun-powder, red and yellow leather, and linen cloth, made of the fine Egyptian flax. The only manufacture in any degree of perfection is silk furt; but the workmanship is lefs highly finished, and the price much greater than in Europe. Their mercery, their hardware, their gun and pillof barrels are all imported from foreign countries. It is difficult to find at Cairo one watchmaker who has fiff enough to repair a watch, and he too is an European. Jewellers, indeed, are more common here than at Smyrna and Aleppo; but they know not how properly to mount the fimplest role. For the mode of hatching eggs at Cairo without incubation, see HATCHING.

The government of Cairo, and of Egypt in general, is vefted in one of the 24 boys (fie Dey); and the chief judicial authority in the city is delegated to a "Mulla," who is annually appointed from Conflantinople; but his jurifdiction is principally directed to cafes of doubt and difficulty. There are, besides this officer, "Cadus" in all the diocfeis, which, in this great city, amount to more than 100. There are also "Imams," or priets of the four fefts, each having the direc- tion of the adherents of his fect. The revenue of the eafis arises from a tenth of the value of the thing litigated. See CADIS.

In Cairo every trade or profession has its fheikh or leader, who has great authority over the fclav of the clafs to which he belongs; and this circumstance much contributes to the good order of the city. The gates also, which are at the end of every ftreet, impede the progres, and render dif- cult the ecape of ill-intentioned persons. Notwithstanding these forms of government and subordination, Cairo affords no inceurity either for life or for property; and, therefore, the stranger on his arrival is struck with the universal ap- pearance of fqualid wretchednels. Indeed, he often meets with horfemen richly clad; but this display of luxury only renders the contrats of indigence the more shocking. Everything that he fees or hears, reminds him that he is in the country of favery and tyranny. The chief jufbles of conver- fation are intellefe diffentions, the public fillery, pecuni- ary extortions, baffinodces, and murders. "The blood of men," says Volney, "is fleed like that of the hift animals. Juifice herfelf puts to death without formality. The officer of the night in his rounds, and the officer of the day in his circuit, judge, condemns, and execute in the twinkling of an eye, without appeal. Executioners attend them, and, on the firft signal, the head of the unhappy victim falls into the leathern bag, in which it is received, for fcar of foiling the place."—"Without any other reafon than the avarice of a powerful chief, or the information of an enemy, a man is fummoned before fome bevy, on fulpifion of having money. A fum is demanded of him, and if he denies that he poftleffes it, he is thrown on his back, and receives 2 or 3 hundred blows on the foles of his feet, nay, fometimes is put to death."—

To the north-eaft of Cairo are gardens, and large houses, to which perfons of rank and opulence occasionally retreat; and the Mamelukes also perform their military evolutions, and exercife their horfes, in an open fpace appropriate to this purpofe. The ground under the mountains to the eaft is filled with tombs. The gates of Cairo are numerous; but the most remarkable are two at the northern extremity of the city, called "Bab-el-Nafr," and "Bab-el-Fitusch," which prefent a splendid display of Saracenic architecture. N. lat. 30° 2' 44". E. long. 31° 18' 16". Cairo by the mean of feveral accounts is about 59 geographical miles W. of Suez, equal to 1° 8' of longitude; and accordingly, Ca- rio should stand at 31° 20' of longitude. Savary's Egypt, vol. i. Volney's Travels, vol. i. Somnial's Travels. Browne's Travels in Africa. See EGYPT.

CAIROAN,
CAIROAN, or KAIR-WAN, the Pisa Augusta of the Itinerary, a wall'd city of Africa, in the ancient Bizzarion, or modern kingdom of Tunis, inferior in trade and in number of inhabitants only to Tunis, is situated in a sandy barren plain, 8 fagues W. of Sufa, and about the same distance S.W. of Herka. In this city and its vicinity are several fragments of ancient architecture. Its present name seems to be synonymous with "Caravan," and might originally denote the place where the Arabs had their principal station in conquering this part of Africa. It is said to have been founded for this purpose, and colonized by Akba, or Hueba, in the 53rd year of the Hegira, A.D. 670. Notwithstanding the inconveniences of its situation, which renders it necessary to obtain vegetable food from a great distance, and to collect a precarious supply of rain-water in cisterns or reservoirs, Akba encumbered it with a wall, enclosing a circumference of 3600 paces; and in the space of five years, the governor's palace was surrounded with a sufficient number of private habitations; a spacious mosque was supported by 500 columns of granite, porphyry, and Numidian marble; and Cairoan became the seat of learning, as well as of empire. Under the government of Ibrahim Ben Aqlab, from whom was derived the dynasty of the Aglabites, in the year 184 of the Hegira, A.D. 860, its buildings and inhabitants were very considerably augmented; and its inland situation, 12 miles westward of the sea, protected it from the Greek and Sicilian fleets. In the year of the Hegira, 585, A.D. 1494, it had its own sovereign, who was an Arab; but he was deposed of part of his dominions by Dragut, who commanded in the city of Tripoli for Soliman II. emperor of the Turks. N. lat. 35° 5' E. long. 10° 13'.

CAISIOMU, a town of the island of Cuba; 30 miles E.S.E. of Villa del Principe. Architecture. The practice of building in caissons is a method sometimes adopted in laying the foundation of bridges in very deep or rapid rivers. There are large hollow vessels framed of strong timbers, and made water-tight, which being launched and floated to a proper position in the river where the ground has been previously excavated and levelled, are there sunk. The piers of the bridge are then built within them, and carried up above, or nearly to the level of the water, when the sides of the caisson are detached from the bottom, and removed; the bottom, composed of a strong grating of timber remaining, and serving for a foundation to the pier.

The most considerable work, which has come to our knowledge, where caissons have been used, is in the building of Wellmington-bridge; of these, therefore, a particular account may be acceptable. Each of the caissons contained 150 loads of fir timber, and was of more tonnage than a man of war of 40 guns; their size was nearly 80 feet from point to point, and 30 feet in breadth; the sides, which were 10 feet in height, were formed of timbers laid horizontally over one another, pinned with oak trellons, and framed together at the corners, except the alant edges, where they were secured by proper iron-work, which being unscrewed would permit the sides of the caisson, had it been found necessary, to divide into two parts. These sides were planked across the timbers inside and outside with 3-inch planks, in a vertical position. The thickest of the sides was 18 inches at bottom, and 15 inches at top; and in order to strengthen them the more, every angle, except the two points, had three oaken luce timbers properly bolted and secured. These sides when finished were fastened to the bottom or grating, by 26 pieces of timber on the outside, and 18 within, called straps, about 8 inches broad, and about 3 inches thick, reaching and lapping over the tops of the sides; the lower part of these straps were dovetailed to the outer curb of the grating, and kept in their places by iron wedges. The purpose of these straps and wedges was that when the pier was built up sufficiently high above low-water-mark, to render the caisson no longer necessary for the masons to work in; the wedges being drawn up, gave liberty to clear the straps from the mortices, in consequence of which the sides role by their own buoyancy, leaving the grating under the foundation of the pier.

The pressure of the water upon the sides of the caisson was relieved by means of a ground timber or ribbon, 14 inches wide, and 7 inches thick, pinned upon the upper row of timbers of the grating; and the top of the sides was secured by a sufficient number of beams laid across, which also served to support a floor on which the labourers flood to hoist the stones out of the lighter, and to lower them into the caisson.

The caisson was also provided with a sluice to admit the water. The method of working was as follows: A pit being dug and levelled in the proper situation for the pier of the same shape as the caisson, and about five feet wider all round; the caisson was brought to its position, a few of the lower courses of the pier built in it, and funk once or twice to prove the level of the foundation; then being finally fixed, the masons worked in the usual methods of tide work. About two hours before low water, the sluice of the caisson, kept open till then, left the water, flowing to the height of many more feet on the outside than the inside, should float the caisson and all the stope work out of its true plane, was shut down, and the water pumped low enough, without waiting for the lowest ebb of the tide, for the masons to set and cram the stope work of the succeeding courses. Then when the tide had risen to a considerable height, the sluice was opened again, and the water admitted; and as the caisson was purposely built but 16 feet high to save expense, the high tides floored some feet above the sides, but without any damage or inconvenience to the works. In this manner the work proceeded till the pier rose to the surface of the caisson, when the sides were floated away to serve the same purpose at another pier. (Labeye's Description of Wellmington-bridge.)

CAISSON, in the Military Art, is sometimes used for a keel; and in particular for a bomb-keel. The caisson is considered as a superficial mine, or fourenus. Caisson is also a covered wagon to carry bread, or ammunition.

CAISTRUM, in Geography. See CASTOR.

CAISTRUS, in Ancient Geography, Kaisfer, a small river of Aia Minor in Ionia, formed by the union of two branches, which had their sources in mount Tmolus, and from the south-west, watered Metropolis or Ephesus, near which it discharged itself into the sea. It is called at present by the Turks "Kitschik Meander," or the Little Meander. Virgil refers to it, "Jan varias pelagis volubris, et qua Aia circum Dulcius in flagna rimantur prata Cayliri." — Georg. l. 1.

CAITAIA, in Zoology, the name under which Marcgraf notices fumia cicuris of Gmelin.

CAITHNESS, in Geography, sometimes denominated the shire of Wick, is the most northerly county of Scotland. Its S.W. border unites with the county of Sutherland; and the remainder is washed by the waters of the Pentland-Firth, and the German Ocean. This district, includes an area of about 35 miles from N. to S. by 22 miles from east to west. Mr. Pennant describes the country as a large morass interspersed
The rocky, student one... "I do," and large, A divided land is Dunbar-head, pointing to the opening of Pentland-firth; Orcaes, or Holburn-head, and Dunnet-head, both pointing northward to the north. Scrire-bay is a good harbour for shipping. There are two other smaller bays named from the contiguous places, Reay and Thuto. The only island annexed to this county is Stroma, which is situated in the Pentland-firth; the property of which was formerly claimed by the Earl of Orkney, but was afterwards attached to Caithness.

The cause of this reversion is said to have resulted from a curious experiment. The Earl of Orkney and Caithness contended for the property of this island, it being situated about midway between their respective districts. Instead of retorting to the sword in this dispute, they mutually agreed to abide by the issue of a more inoffensive trial. As venomous animals would not live in the Orkneys, some were conveyed to Stroma, and finding that they continued to thrive in the island, it was determined that it naturally belonged to Caithness, and was adjudged to that earldom accordingly. This county is well watered, and contains a few birch plantations; but the soil and climate are unfavourable to the growth of timber. At some parts of the coast, the sea is generally very impetuous, being continually agitated by violent counter tides, currents, and vortices. Fish are caught in great abundance, but from the above named causes, and the want of convenient harbours, the proprietors do not derive much advantage from this exportation. The rocks round the shore are perforated into numerous caves, which are frequented by an abundance of seals. Many of these are destroyed by the inhabitants. Eagles, hawks, and a vast quantity of sea-fowl frequent these rocks.

Caithness is well peopled with a race of hardy, athletic inhabitants, whose chief employ, and source of livelihood are fishing, and breeding sheep and black cattle. Of the latter it has been recorded, that from 1000 to 2000 head have been sent from this county in one year. In bad seasons, the farmers moly kill and salt them for home consumption and for exportation. Great numbers of swine are also reared here, but according to the opinion of Dr. Morison, (Sir John Sinclair’s Statistical Account, viii. 150.) “the damage they do in the winter to the graps and corn lands, as they are allowed to roam at large, far exceeds any advantage that can accrue from them.” Thes animals are rather peculiar in character and species: they are short, high-backed, long-haired, shaggy, sly, and long roled, have high erect ears, and are very wild in aspect. Barns and granaries are unknown to this county; the corn is threshed out and preserved in the chaff in byres, which are flacks in the shape of bee-hives, and thatched quite round. Much salmon is taken in the rivers of this county, particularly at Caife hill, Dunnet, Wick, and Thurso. At the last place there was “a miraculous draught taken within the memory of man; not less than 1500 being caught at one tide.” (Pennant’s Tour in Scotland, i. 232.) Caithness is divided into ten parishes, and contains one royal borough, Wick, and the town of Thurso. It sends a member to Parliament alternately with the county of Bute. The principal landholders are the earl of Caithness, Sir John Sinclair, bart. Sir Benjamin Dunbar, and — Sinclair, esq. all of whom polled seats in the county. Many monuments of antiquity are still remaining in Caithness, most of which are of a military nature. Of the more ancient kind are the Cairns, Duns, and Tumuli; which are scattered over many parts of the county. Some ruins of castles are still left at Caife-Sinclair, Germenico, Auchnaven, Dirlot, and Lochmire. In mineralogy, Caithness possesses some articles of value, as excellent free-stone and lime stone; also, copper, lead and iron ores. At the N. E. point of Caithness is Dunbar-head, the most extreme northern promontory of Britain. At this place the breadth of the frith does not exceed twelve miles, and is the most usual ferry or passage to the Orkney Islands. In the fords of Moray and Bradda, are abundance of red deer, roe-bucks, &c. and the county abounds with gruthe, heathcocks, plower, hares, and moor other game. Birds of a peculiar species, called Snow-fleets, frequent this county, in large flights, about the middle of February, and depart in April. They are about the size of a sparrow, and esteemed very delicious in flavour. The last private war in Scotland was occasioned by a dispute relating to this county. Pennant’s Tour in Scotland ed. Sir John Sinclair’s Statistical Account of Scotland.

CAIUS, Pope. In Biographia, succeeded Eutychianus in the pontificate A.D. 283, and held it till A.D. 296. The church of Rome reckons him among her martyrs; but history informs us, that, having concealed himself under the perfecution of Diocletian, he died in peace A.D. 296. To him is ascribed a decree that bishops should pass through the seven inferior orders of the church before they assumed the episcopal office.

CAIUS, or CAIUS, an ecclesiastical historian, who flourished, according to Cave, about the year 210. Photius says, “that he was ordained bishop of the nations,” i.e. as some have interpreted the phrase, that he was ordained to preach the gospel to infidel countries, without the allotment of any particular diocece. Fabricius reads, instead of “nations,” Athens; and accordingly suppofes, that, having been at first a presbyter of the church of Rome, he was afterwards made bishop of Athens. It has been ascertained by many writers, but upon disputable authority, that he was a disciple of Irenæus. Three or four books are ascribed to Caius, viz. “A dialogue or disputation with Proclus or Proclus,” a follower of Montanus; “Of the Universe;” the “La-byrintli;” and a treatise against the “Here of Artemon.” Some fragments of these works are still extant. The first, however, is, in Dr. Lardner’s opinion, the only piece justly ascribed to him. In his dialogue are some passages that indicate the author’s respect for the ancient scriptures generally received by Christian; though he seems to have thought, the epistle to the Hebrews was not written by St. Paul, and that the book of the Revelation was not genuine, but probably an impudence of Cerinthus. Cave, H. L. T. i. p. 100. Lardner’s Works, vol. ii. p. 371, &c.

CAIUS, BEARNARD, born at Venice towards the end of the 16th century, where he received his education, published, in 1606, “De Vefcicantum Ufu.” He entirely rejects blisters in all acute diseases, as adding greatly to the malady by irritating the system. He also published in 1608, “De Alimentis, quos esse naturam convenient,” de Voluptate, Sapere, Frigida Puteane, Viribus Salis Nitrata refurgiandam,” 4to, republished in 1610. Haller Bib. Med.

CAIUS, KAFV, or KEY, JOHN, an ingenious and learned physician, was born at Norwich, October 6th, 1510. After passing through the usual school education at Norwich, he was admitted a student in Gonvill Hall in Cambridge, Sept. 1st, 1529, and having distinguished himself by his proficiency in literature, he was made fellow of that community in 1532. His thirst for knowledge, and his desire of perfecting himself in the different branches of medicine, determined him to visit the Continent, and to pass some time at Padua, then famed for the celebrity of its professors, particularly in that branch of science. He here studied under John Baptista Montanus, having Vesalius for his fellow student.

dent. His progress here in Greek and Latin, as well as in the knowledge of anatomy and medicine, equalled the pro-
mifes of his early years; as was evinced by his translations and
and commenataries on various parts of the works of Hippo-
Gratus, Galen, Scribonius Largus, &c. correcting the errors
of the transcribers, and elucidating and explaining the more
difficult passages. With the view of hearing other pro-
feffors, and of examining ancient manuscripts, he visited
of the principal cities of Italy. At Bologna he resided some
time, and there took his degree of Doctor of Medicine, in
1541. He then returned to Padua, and in conjunction
with Realus Columbius, read lectures on the Greek text of
Ariftotle. In 1544, he came to England, and for some
time read lectures in anatomy to the corporation of surgeons
in London. He afterwards practised medicine at Shrewsbury,
where he was at the time when the sweating sickness made
its appearance in 1551; of which he published a popular
account, with the view of instructing his countrymen in the
nature of the complaint, and of the methods he thought most
proper for opposing its progress. This he afterwards, in
1556, published again in Latin, much enlarged and
improved, under the title of "De Ephemera Britannica." As
it contained an accurate description of the disease, whatever
might be the value or the efficacy of the practice, it was
thought deserving of being preferred, and was reprinted in
1721, 12mo. His reputation for learning and abilities
being established, he was admitted a fellow of the College
of Physicians in 1547. He was also appointed physician to
King Edward the Sixth, and in succession to the queens
Mary and Elizabeth. To the College of Physicians he was
a warm and strenuous friend, and on the death of Lmacer,
under whom it was founded, he was appointed president,
under which office he held for seven years. During this
time, he revised their laws, appointed a president, and,
to encourage the study of anatomy, he obtained a grant of
the bodies of two malefactors every year, to be dissected
under the direction of the College. He also drew up their
annals in Latin, or an account of their institution, with a
journal of their proceedings, which he left with the College.
Mindful of his alma mater, he obtained from Queen Mary a
power of erecting Gresham Hall into a College, adding to
its endowments, provisions for three fellows, and twenty
scholars. He added an entire new court to the College,
and built three gates. They cost him together 18,321.
The improvements were begun in 1553; and when completed he
was made Master of the College, and continued in that post
until a short time before his death, when he resigned it to Dr.
Legge, but still resided as a fellow commissor; and died
there in 1573, aged 63 years, having in his last illness
supported himself by woman’s milk. On his tomb, by his
inscription, was engraved, "Fui Causus." Besides his versions
from the Greek, and the "Ephemera Britannica," he pub-
lished "De Cambus Britanniciis," 1570, interested entirely by Mr.
Pennant in his British Zoology; to which were added
"Historia rarioarum Animalum," originally printed in
Gefener’s collection; also, "De Libris propriis," and "De
Antiquitate Cantab. Academici"; and from numerous
medicated manuscripts, appears to have projected various
Mem. of Medicine in Great Britain.

CAJUS, in Entomology, a species of Papilio (Hesperia
Fabricius), having entire brown wings, with a bluish disc;
beneath, varied with cinerous and white, with brown occi-
doral dots. Inhabits India.

CAJIX, in Geography, a town of France, in the de-
partment of the Somme; 12 miles E. of Amiens.

CAKE, a short sort of bread, denominated from its flat,
round figure. We meet with divers compositions under the
name of cakes; as feed-cakes, made of flour, butter, cream,
sugar, coriander and caraway-seeds, sage, and other spices
and perfumes, baked in the oven; plum-cakes, made
much after the same manner, only with fewer seeds, and
the addition of currants; pan-cakes, made of a mixture of
flour, eggs, &c. fried; cheese-cakes, made of cream, eggs,
and flour, with or without cheese-curd, butter, almonds,
&c.; out-cakes made of fine oatmeal flour, mixed with yeast,
and sometimes without, rolled thin, and laid on an iron
or plate to bake over a low fire; sugar-cakes, made of
fine sugar beaten and scoured with the face flour, adding
butter, rose-water, and spices; rose cakes, planatae reficis,
are leaves of rose dried and pressed into a mass, fold in the
shops for ephepith. See EPHIPHEM.

CAKE of Copper, denotes a quantity from 1 lb. to
one hundred-weight.

CAKE-IN, a denomination sometimes given to the white
of virgin-wax.

CAKE-soup, lands distinguished from soap and bal-
soap. See SOAP.

CAKET, in Geography, a town and capital of a country in
Asia, in the northern part of Persia, near mount Caucasus,
trading principally in silk. N. lat. 43° 21’. E. long. 46° 49’.

CAKEL, in Botany, (Tournefort, Gartner, and Ven-
tenat.) See BUNIA.

CALA, in Geography, a town of Spain, in the country of
Seville, on the borders of Estramadura; 14 miles S. of Lerena.

Cala, See El Callah.

CALABA, in Botany. (Pluhot.) See CALOLYPHUM.

CALABAR, or CALABARI, in Geography, a country
of Africa in the kingdom of Benin, or Upper Guinea, usually
distinguished into New and Old Calabar, with a river of
the same name in each. The entrance into New Calaba is
in N. lat. 4° 30’. W. long. 9° 10’. That into Old Cala-
bar is in N. lat. 4° 32’. W. long. 10° 58’. The Dutch
carry on a considerable trade with this country. See
BENIN.

CALABASH, or Botany. See CURCUMA PEP.

CALABASH-tree. See CRESCENTIA.

CALABASH, African. See ADANSONIA and BAOBAB.

The word is Spanish, cabaza, which signifies the fame.
The Indians, both of the North and South sea, put the
pales they have filled in calabashes, and the negroes on
the coast of Africa do the same by their gold-dust. The smaller
calabashes are also frequently used by these people as a mea-
ure, by which they weigh these precious commodities to the
Europeans.

CALABASH-bay, in Geography, lies on the S.W. side of
the island of Jamaica, between Flint bay on the east, and
Swift’s river on the west, and affords good anchorage.

CALABER, Quintus, in Biography, a Greek poet,
appoited to have flourished under the emperor Anaxiades I,
about the year 451, and to have derived his name from Cal-
abria, though he refuted chiefly at Smyrna. He is known
as the author of a poem, consisting of 14 books, on the
"Paraphrasmata" of Homer, or the events of the Trojan
war, not related by that poet, and commended for its ele-
gant verification. It was discovered by cardinal Della-
in a monastery near Otranto in Apulia. Two of the books, describing the capture of Troy, were published separately by Neander, in his "Opus Aeneum," Leip. 1557. Editions of the whole have been given at Hanau, Svo. 1604; and by Pau at Leyden, Svo. 1734. Voss. de Poet. Graec.

CALABREZA, in Geography, a town of South America, in Terra Firma, on Oronooko river.

CALABITE, a small island of the East Indian ocean, being one of the Philippine islands, between Mindoro and Luzon.

CALABRIA, in Ancient Geography, a name supposed to have been received from the oriental "calab," or pitch, on account of the resin obtained from the pines of this country, and corresponding to that part of Italy more generally denominated "Mellapia," and the present Calabria.

CALABRIA, in Geography, a country of Italy, in the kingdom of Naples, divided into Calabria Citera and Calabria Ulteria, or Hitler and Further Calabria. The former is bounded on the north by Baficatia, on the east by the gulf of Taranto, on the south by Calabria Ulteria, and on the west by the Mediterranean, and a small part of Principato Citera. Swinburne estimates its extent at 1,460,592 acres, (five moggie being equal to four English acres) and the number of inhabitants at 315,326. It abounds in excellent fruits, corn, wine, oil, hemp, cotton, flax, saffron, honey, salt, wool, silk, and cotton. It has some mines of gold and silver, lead and iron, together with sulphur, alabaster, and rock-crystal. Hogs and sheep are numerous. Its coasts are defended by towers. Its principal towns are Cozenza, Paola or Paula, Diignano, Caffano, Scalea, Cariati, Roffano, Umbriatico, Strongoli, Carenza, Martorano, and Amantea. Its chief rivers are the Co-chile, Cratte, Lao, Celano, Trionto, Aquilone, and Bato. Calabria Ulteria is bounded on the north by Calabria Citera, and on the east, well, and south, by the Mediterranean sea. The productions are nearly the same with those of Calabria Citera. The extent, according to Swinburne, comprehends 1,591,878 moggie; and the number of its inhabitants is 493,392. The principal towns are Catanzaro, Cotrone, St. Sorgeta, Holan, Taverna, Nicaladro, Delcalfro, St. Eufemia, Squillace, Tropea, Nicotera, Mileto, Oppido, Gerace, Reggio, and Bova. The chief rivers are the Adda, Angiota, Tacia, Aro, Alice, Atmo, Motaro, and Metrano.

In Calabria all the oxen are white, large, and long-horned, except those of the red breed, which have been introduced from Sicily by the princes of Cariati and Gerace. The buffaloes are black; and the milk of the goats, sheep, and hogs is of that hue. The last species have no hair, but their hides are as flax as those of elephants. In some parts of this country dormice are accounted delicate game, as they were in ancient Rome, where they were kept in warrens, and fattened for the tables of the most refined epicures. They are smoked out of their nests in hollow trees, and caught with sharp hooks. Their skins make very fine leather. The Calabrian horses are pretty spirited, and brilliant in their motions; but generally low, and seldom free from vice. All live animals in Calabria are taxed. Six carlini (or about 28, 3d.) are paid for an ox, 4 grains (to which make a carlini) for a sheep; and therefore it is no wonder that the graziers should be indigent, and that the cottagers should keep no beast of any kind, and that they should live upon casual and insubstantial nutriment, instead of milk, cheese, and other wholesome diet, which is the rich patrimony of the country ought to afford them. Arable land is ploughed four times; but instead of laying down their fallows with hay, as in the northern counties, the Calabrians plough them. The Calabrian farmers think he does his farm ample justice if he ceases to plough it for two or three years, and leaves the good grass, accidently produced there, to make its way, as well as it can, through the matted fibres of various sorts of rank weeds. The Calabrian foresters no amelioration of his condition from any of his efforts; and he is discouraged by the apprehension that increasing activity and produce on his part would subject him to an additional weight of taxes and oppression.

The Zingari, or gypsies, of Calabria do not contract alliances with any other clans of inhabitants, but marry among themselves. They have no permanent property, nor any fixed habitation. They subsist by the profits of little handicrafts, and chiefly by trucking asses and horses, which they do for the smallest trifles to boot. They generally work in iron, and make trivets, knitting-needles, and bodkins, and baubles of that kind. Their dress is very mean; they have their chins, but wear long hair, to which they apply neither comb nor scissors. Their religion is altogether mysterious; and though they occasionally conform to the ceremonies of the Roman Catholic church in marriage, burials, &c. they often perform these functions according to their own customs, which resemble those of the heathens. At their weddings they carry torches, and have parapymas to give away the bride, with many other unusual rites. With regard to their conduct, they are depraved and licentious; and are universally accounted to be pilferers, cheats, faithless, thievish, and abandoned to all manner of dissoluteness. They accustom themselves to tell fortunes, and to play juggling-tricks, as they do in other countries. In 1590, they were banished the kingdom as thieves, cheats, and desperadoes, for the Turks. In 1569 and 1571 the order was renewed; but not being enforced, it had little effect. They make use of two languages, one Calabrian, with a foreign accent and pronunciation; the other peculiar to themselves, which, in found, bears a great affinity to the oriental tongues, and is spoken by them whenever they have secrets to impart to each other.

There is a visible difference in the dress and manners of the two Calabrins; the inhabitants of the south part resemble the Sicilians; and, like them, they are alike clothed in their turn and what they wear. The Sicilians, it is supposed, even now betray strong marks in their character of their ancient connection with the Africans, and the North Calabri compared to their disposition, much German solidarity, arising perhaps from colonies transplanted thither by the Swabian princes; and in the southern Calabri, and Neapolitans, particularly the latter, are evident traces of Grecian manners and temper. Calabria is in bad repute with respect to the safety of travellers; and yet the people seem perfectly honest with regard to one another; for their houses have no bolts or bars to their doors; and during the owners' absence, they are left to the mercy of every passerby. Swinburne's Travels in the Two Sicilies, vol. ii. and iv.

Calabria, formerly peopled by the Bruttii and other Greek colonies, has been in all ages convulsed and desolated by earthquakes. In 1638 and 1639 the two provinces of Calabria were almost utterly destroyed; and that of 1744, though not equally injurious, was very calamitous and distressing. The dreadful effects of the succession of earthquakes of 1753, are particularly described by Count lapsioli and Sir William Hamilton. The part of Calabria, according to Sir William's account, which was most affected, is comprehended between the 58th and 59th degree; and the greatest force of the earthquake seemed to have exerted itself from the foot of those mountains of the Appenines, called the Monte Duro, Monte Sacro, and Monte Cautore, extending westward to the Tyrrhenian sea. The towns, villages, and farm-houses, nearest
CAL

CALACTA, a maritime town, seated on the northern coast of Sicily. Ptolem. CALADIN, in Botany, a plant which Limnæus afterwards called Arum eufulentum. Ventenat has separated it from Arum; and uniting it with the ovatum, the fagittæolum and arborecenis of Limnæus, and the bicolumnum of Aiton, with two other sorts known, has formed a new genus under the original name given by Rumphius, with the following general character. Spathe swelling, folded in its lower part. Spadix or ament shorter than the spathe, simple, straight, cylindric, with the male flowers on the upper part, and female on the lower. Anthers sese, disposed in a spiral form, with twelve furrows full of pollen in molecules agglutinated together, and terminated at the top by a flat surface in the shape of a lozenge, which is sprinkled with shining dots, and crenulated at its border. GCM numeros; orbicular, concave. Sizga sese, umbilicate; full of a viscous liquor. The space between the flaments and pistils occupied by four rows of oblong, obtuse, elevated glands. Fruit similar to that of Arum. Its essential character, according to Ventenat, is founded on the situation and structure of the anthers, and even of the pollen itself, on the direction and form of the glands, and on the umbilicated stigmas. See ARUM.

CALAHUNNUM, in Ancient Geography, a town of Spain, assigned by Ptolemy to the "Callaici Bracarii" in the Terragonum, and situate, according to M. d'Anville, to the north-west of Aquae Flavium.

CALAE, islands of the Indian ocean, placed by Arrian at the mouth of the Peric gulf.

CALÉNUS, a fountain of Asia Minor in Lycia. Steph. Byz.

CALAF, in Botany, (Alpinus Ægypt.) See Salix Ægyptiaca.

CALAF, in Geography, Karaaghoun-Souli, a stream of Asia in Mesopotamia, which, running from west to east, discharges itself into the Tigris, near Amida.

CALAGORINA, a town of Spain, attributed by Ptolemy to the Vocabenses.

CALAGORRIS, Cazeris, a place of Gaul, belonging to the "Volcæ Teufofages," at some distance S.W. of Tolosa, and comprehended within the Narbonensis Prima.

CALAGUM, Chaille, a place of Gaul, belonging to the "Maldi," S.E. of Maldi or Tatamine (Meaux.) It was included in the Lyonnaesis Quarta.

CALAGURIS, now CALAHORA, a town of Hispania Citerior, seated on the Iberus, belonging to the Vaconces. Allo, a town of Spain, belonging to the Hébertes, according to Ptolemy; now Lobariz. It was situated N. W. of Olca.

CALAH, or CALF, in Ancient Geography, one of the four cities built by Alhor, of which we have an account in Gen. x. 11, 12. This is supposed to be the Calach, situate about
the springs of the river Lycus, and mentioned by Strabo as the capital of a province called Calachene, seeming to be the same with Tpomey's Calache, above Adiabene, towards mount Niphates.

**CALATXORRA**, in Geography, an episcopal town of Spain, in Old Castile, seated on the south side of the Ebro, on the borders of Navarre; 62 miles N.W. of Saragossa.

N. lat. 42° 18'. W. long. 7° 7'.

**CALAI**, a sea-port town of France, and chief place of a canton, in the department of the Ais, and district of Boulogne; the place contains 6,750, and the canton 15,266, inhabitants; the territory includes 165 kilometres, and 12 communes. Calais has a citadel on the N.W. side, and near the sea, as large as the town, with one entrance, and is strongly fortified; but its chief strength depends upon its situation among the marines, which may be overthrown at the approach of an enemy. It is encompassed, except for a short space towards the harbour, by a moat and wall, which latter serves as a public walk. It is a regular well-built town, with a spacious and handsome square, and its streets are tolerably clean and well paved; and has several churches and monasteries. Its harbour, formed by a small rivulet, is too much obstructed by sand to admit of large vessels or even common merchant ships, except at high water. This haven ebbs dry at every tide; but at high water, with a common flow, it has not less than 3 fathoms. The flood sets in N.E. by E. The harbour commences at the gate of the town, where a fine massive quay terminates in two long wooden mole, which extend far into the sea. Calais is a trading town, and in time of peace regular packets for the mail sail from and to England; and other passage boats form a constant intercourse between this place and Dover, from which it is distant 22 miles S.E. Some have supposed that an island formerly joined Calais and Dover; and that the rupture of it was occasioned by an earthquake, and has been gradually widened by tides and currents. Calais communicates by means of canals with St. Omer's, Gravelines, Dunkirk, &c.

About the close of the 12th century, Calais was only a fishing village; but from the success of its inhabitants in the herring fishery, it soon acquired so much importance as to attract the notice, and excite the rapacity of the church; so that in the year 1180, we find that pope Alexander III. granted the title of all the herring there taken to the abbey of St. Bertin, recorded for its immense wealth, for the luxurious and diffolute lives of its monks, and for the wealthfulness of its abbots. The honest fifemen, not readily comprehending the pope's right to give away their property, declared that they would sooner decimate the monks than suffer their herring to be decimated. They were, however, reduced to obedience by the count of Flanders, who was then their regent, as guardian to Idi, count of Boulogne. Its walls and canal were built in the year 1228 by Philip count of Boulogne, brother of Lewis VIII.; but its municipal laws and privileges are supposed to have been granted by the countess Idi, and her fourth husband, Renauld de Dammartin, in the year 1191. From these laws it appears that the city was governed by its own magistrates elected by the citizens, and by a bailiff appointed by the count. Among its privileges we find that, if a woman offered to the king, as her husband, a man condemned to death for theft, the might demand and obtain his pardon. In 1347, Calais was taken by Edward III. of England, after having been reduced to extreme distress by famine. Edward, having been detained under its walls for eleven months by the obstinate resistance of its defenders, conveyed a messenger to the governor, who informed him that he would grant them no terms; but that they must surrender at discretion. At length, in consequence of the frightful calamities of the governor, and the intercession of sir Walter Manny, whom he had deputed as his messenger, Edward consented to grant their lives to the garrison and its inhabitants, except those of the principal burgesses, who were required to deliver to him the keys of the city, with ropes about their necks. In this extremity of distress, Eustace de Pierre, one of the most wealthy merchants of the place, voluntarily offered to be one of those fixed victims; and his example was followed by five others of the richest citizens. These illustrious patriots, barefoot and bared-headed, with ropes about their necks, were attended to the gates by all the inhabitants with tears, blessings, and prayers for their safety. When they were introduced into the presence of Edward, they laid the keys of the city at his feet, and, falling upon their knees, supplicated his mercy in straits so moving, as to melt the spectators into tears. The queen enforced their intercession, and impressed and obtained their lives. Having thus succeeded, she conducted them to her own apartment, entertained them honourably, and dismissed them with presents. Edward, having taken possession of the city, found it necessary to turn out all the ancient inhabitants, and to people it with English. Calais remained from this time in subjection to England till the reign of queen Mary, when it was retaken by the duke of Guise. The duke obliged all the inhabitants to abandon the place, and conferred the government of it upon Des Termes, who was soon after made a marshal of France. By the treaty at Chateau Cambresis, it was agreed, that Calais should, after the expiration of 8 years, be restored to England; and, at the expiration of that term, queen Elizabeth dispatched some troops to recover it; but the surrender was refused, because, five years before, the English had taken Havre, and violated the terms of the treaty. In the year 1506, it was taken by the Spaniards, under the conduct of the adelaidue Albert, but was restored two years after by the peace of Vereins. In 1694, it was bombarded by the English, under sir Cloudy of Shovel, but without fulfilling much damage. Calais is distant 7 leagues from the South Foreland, and 40 from Dunmose; 5 polls S.W. from Dunkirk, and 34 S. from Paris. N. lat. 5° 57' 31". E. long. 1° 50' 56". High water 11' 30'.

**CALAIS,** St. a town of France, and principal place of a district in the department of the Sarthe; 6 leagues E.N.E. of Chateau du Loir. The place contains 3,530, and the canton 15,249, inhabitants; the territory comprehends 307½ kilometres and 14 communes. N. lat. 47° 56'. E. long. 0° 39'.

**CALAIS,** a township of Caledonia county, and state of Vermont, in America; 105 miles north-easterly of Bennington; containing 45 inhabitants.

**CALAMA,** in Ancient Geography, Gela, or Calma, an episcopal town of Africa, in Numidia; situate to the south-west of Hippo-regius. St. Augustine mentions a disturbance that happened in this place, A.D. 405, or 409; and that soon followed a law enacted by Honorius in 407, or 408, expressly prohibiting the solemnities of the Gentiles.

**CALAMA,** the name of a village of Asia, in Carmania, or Gedrosia, according to Arrian.

**CALAMA,** in Geography, a town of Naples, in the province of Calabria Ultra; 6 miles N.E. of Reggio.

**CALAMAE, or CALAME,** in Ancient Geography, a borough of Peloponnesus in Messenia, seated on the river Aris, and mentioned by Polybius and Pausanias.

**CALAMA-**
CALAMAGROSTIS, in Botany, (Trag. ic. Dalech. Hift.) See Triglochin palustris. Linnaeus has given it as a trivial name to a species of Agrostis, and also to one of Arundo. Dr. Withering has made it a generic appellation for such species of Arundo as have only one floret in a calyx: but, as Dr. Smith justly observes, (Flor. Brit. vol. i. p. 145.) the very natural genus arundo ought not to be broken merely on account of a difference in the number of florets, and, if that were not the case, the term calamagrostis is not admirable, as a generic name, on the established principles of the Linnaean Nomenclature.

CALAMARCO, in Commerce, a woollen stuff manufactured in Brabant and in Flanders, particularly at Antwerp, Lille, Tournay, Turcoin, Ronbaix, and Lannoy. It is commonly woven wholly of wool; there are fome, however, wherein the warp is mixed with flax, and others with goat’s hair. There are calamanses of all colours, and diversely wrought. Some are quite plain, others have broad stripes adorned with flowers; some with plain broad stripes; some with narrow stripes; and others watered. This has been also an inconsiderable branch of the woollen manufacture in England, both for home wear and exportation; but of late it has declined.

CALAMRACUM, in Ancient Geography, a place of Italy, in Magna Graecia, between Petelia, and the north of Lucania.

CALAMARIA, in Botany, (Dillen. Musc.) See Isogalium lacustris.

CALAMARIE, one of the natural orders of Linnaeus, nearly allied to the galesies, and having commonly the same kind of leaves, but differing from them in not having a two-valved glume. The calamaria have a culm which is generally triquetrous, rarely cylindrical, often leafless, or bearing only a few leaves. The leaves are generally more rigid and rough, and the flowers are often diploed in an imbricated manner. The genera enumerated in the Systema Naturae are,bobartia, (but the genus is now abolished; see Bobartia) scirpus, cyperus, eriophorum, carex, and schanus; with a doubt, whither flagellaria, juncus, and fcheuchzeria should not be added. In the posthumous lectures of Linnaeus, as published by Giecke, they stand thus: sparganium, typha, eriophorum, scirpus, carex, fcleria, cyperus, schanus, reftio, galinia, kyllingia, fuierna. The genus fcleria is added by Giecke.

This kind inhabits America: general colour livid with linear brown fritters and dots: beneath teffellated with brown.

CALAMATA, in Geography, a town of European Turkey, in the Morea, seated on the river Spinazea; taken by the Venetians in 1665; but since retaken, together with the rest of the Morea, by the Turks; 13 miles W. of Miftra.

CALAMBA, or CALAMBA, in Commerce, a kind of wood brought from China, usually sold under the denomination of Agalma aloes, or agallochum. Sir Phil. Vernetti makes calambe and lignum aloes synonymous. Others seem to distinguish, refining calambe wood to the bell fort of aloes wood, growing chiefly in Malacca, and Sumatra; and much used in India for making of beads and crucifixes. Phil. Trans. N. 43. p. 863.

CALAMENTHIA, or CALAMINTH, in Ancient Geography, a town of Africa, in Libya, belonging to the Phoenicians.

CALAMIANES, in Geography, a cluster of islands in the Indian Sea, among those called the “Philippine Islands,” situated at a small distance from the northern cape of Paragusa, and west from Manila, and giving name to a province or government. They are reckoned twelve in number, which are all small, and inhabited by peaceable Indians, who pay tribute. The chief product of their mountains is wax, which they gather twice in the year. The rocks over the sea afford some of the effumed birds’ nests, and on the coasts are fine pearls.

CALAMIDES, a cluster of islands, amounting to about seventeen, situated in the Indian Ocean, 14 or 15 leagues S.W. of Lubar, and forming a province; the largest of which is Paragua, which fea.

CALAMIFEROUS, in Botany, a denomination given by one to those otherwise called culminiferous plants.

CALAMINA, in Ancient Geography, a lake of Afa, in Lydia; in which, according to Phryn, were floating islands, which, during the Mithridatic war, served as a place of refuge for the Roman citizens.

CALAMINE, or LAPIS CALAMINARIS, is an ore of Zinc, which fce. The lapis calaminarsis, calcined, powdered, and sifted, forms a heavy brownish-yellow powder, which when mixed with wax and oil forms the “ceratum lapidis calamarios,” (ceratum eptoleum of the old difpenaries,) the most commonly used of all the fimple ungualts. Calamine is much used for taking off films from the eyes of horses, &c.

CALAMINE, in Rural Economy, an ore of zinc, having a white-grey brown, or red colour, and varying in hardness. It is found in Derbyshire, and some other districts, and is supposed by some writers to be capable of being made use of in agriculture with advantage, from its containing oxygen in a large proportion, as one of its constituent principles. Too few experiments have, however, yet been made with this material to fully ascertain its utility in this application.

CALAMINT, in Botany, (Smith Flor. Brit.) See Thymus Calamintha, and Nepeta, removed by Dr. Smith from Meliss.

CALAMINTHIA, (Pluk. Mant. 34. t. 344. in. Mor. Hift. iii. p. 413. S. 11. t. 19. f. 7.) See CUMI-

LA mariana.

CALAMINTHIA arvensis verticillata, (Bauh. Pin. 229.) See MENTHA arvensis.

CALAMINTHIA aquatica belgarum, (Lob. ic. 505.) See MENTHA exigua.

CALAMINTHIA hederaeace, (Scop.) See GLECHOMA hede-

racea.

CALAMINTHIA vulgaris, (Bauh. Pin. 228.) montana, (Dod. Pemp. 98. Riv. t. 96. Blackw. t. 166.) See Melissa calamintha, Linn. Thymus. Dr. Smith.

CALAMINTHIA incana, (Bauh. Pin. 228. Pulegii odoris minor Bar. ic. 1166.) See Melissa ericita.

CALAMINTHIA bituminosa fruticosa, (Tourn. Infl. 194.) Montana incana minor. (Mor. Hift. 3. p. 413. n. 3.) See Melissa frutescens.

CALAMINTHIA teretius genus, (Fuch. Hilf. 456.) See ISULA dyserina.

· CALAMINTHIA, in Ancient Geography, a town of Libya, probably of Mauritania, taken notice of by Herodotus and Hecataeus, whose situation is unknown; but supposed by Bochart, from the etymology of the name in the

Phoenician
Loerii

flanges three, simple. Peric. membranous, top-shaped, or
globular, covered with scales imbricated backwards and

obtuse, one-celled, at first pulpy, afterwards dry. Seeds one,

two, or three, globular, fshy.

Eff. ch. Calyx of six leaves, or with six divisions. Cal-

Gall

rolls none. Fruit a one-celled berry covered with scales

imbricated backward.

Obf. The three inner leaflets of the calyx have the appear-

ance of petals, and it is not easy to determine why they

were not considered as such by Linnæus. The division of

the fyle and the three flanges make it probable that these

are naturally the rudiments of three germs, but two of them

generally prove abortive. Julifon observes that this genus

forms the connecting link between the palms and the gradales,

having the flower of the former and the habit of the fagio.

The fagio palm so nearly resembles calamus in its parts

of fructification that it scarcely seems a distinct genus. The

only difference between them, according to Gurriner, is

that the flowers of the former are monocious, and of the lat-
ter hermaphrodite; and that the embryo of the former is on

the side, and of the latter at the base of the seed. As

the flowers, at least of one species of Calamus, are now al-

lowed to be monocious, the former difference vanishes;

and whether the latter alone be a sufficient generic distinc-

tion, may justly be doubted in the present imperfect state of

our knowledge.

Linnæus makes only one species, but mentions eight va-

rieties, all taken up from Rumphius, who calls them Pal-
mijuncet from their similarity to the palms in their fructifi-
cation, and to the iunco, or rushes, in their flexibility.

Lou-

reiro has distinguished and described six species. Wilkesenow,

has enumerated eight, at the same time acknowledging that

he cannot identify the scipionum, amarum, and dicium of

Loureiro. Poiret has extended them to twelve, from the
descriptions of different authors, but without being abso-

lutely certain that his synonyms arc in all cases exact.

As he is the latest writer on the subject, we shall take him for

our guide.

Sp. 1. C. petreus, Lour. (Rotang. Willd. var. and Linn.

Arundo zeylanica Rumphius: Barm. zeyl. 36. Flor. 468.

Thraci-ficul: Rheed. Mal. v. 12. p. 12, t. 6. 46; Palmituncus calapparins: Rumph. Amb. v. 5. p. 97, t. 51.) "Stem
toch, fett with prickes; prickles erect; spadix erect." Willd. Stems more than a hundred feet high, and at least

the thickness of a man's arm; internodes cylindrical, unequal, furrowed, spotted, about a foot long, downy toward

downy towards the summit. Leaves, or fronds, in terminating tufts, alternate, winged; leaflets sword-shaped, long, straight, beft with

numerous, straight, long, very sharp prickles. Spadix nearly straight, moderately branched. Calyx with six divisions. Berry rather egg-shaped, acuminate. A native of the East Indies and Cochinchina, where it is used for making long

pikes. The inner part of the young shoots, stripped of the bark, is eaten either boiled or roasted on the hearth. The plant is pleasantly acid. 2. C. rudentum, Lour. (C. roting

var. γ Linn. Palmituncus culmus: Rumph. t. 53.) "Prickles of the item reflexed; spadix divergent, straight." Willd. Stems very tough, not more than an inch

thick, but rising by the means of trees, and passing from one tree to another, sometimes to the length of more than

five hundred feet; internodes nearly equal, round, a foot and a half long. Leaves, long, winged, reflexed: common

petiole lengthened into a naked, pendant, prickly frail;

leaflets, short, straight, acuminate, downy, terminated by a long bristle. Spadix, large, spreading out in a loose panicle. Flowers, numerous, nearly fesh. Ber-

ries, very small. It is one of the most common species, and is used instead of ropes to bind untame elephants, to draw

heavy loads, and to make cables for ships. 3. C. fepticemum,

walking cane, rattan. Lour. (Kutatufre: Rheede. Arundo

rotang dicra: Pifon mant. 188. La Marek illuf. pl. 770.

f. 1.) "Internodes of the item, very long, awl-shaped, shing;
finishing; prickles recurved, spadix thick, with short branches. Stem. Stems smooth, gloydy, marked with dark spots; internodes three feet long, or more, unequal. Leaves, winged: leaflets, sword shaped, acuminate; armed, as well as the petioles, with short, recurved, prickles. Flowers, few, but rather crowded on the branches of the spadix. Berry, globular, of a moderate size, and a clear yellow colour. Seed, one, globular. It grows abundantly on both sides of the fronds of Maldace, whence it is exported into China and Europe; and on account of its long internodes and glossy surface, has been long preferred for walking canes. 4. C. caerulea. Lour. (Palmijuncus verus; Rumph. t. 54, rotang var. S. Linn.) "Prickles of the stem horizontal; spadix erect; three of the leaflets of the calyx very long." "Willd. Stem, single and not, as in other species, several from the same root; more than a hundred feet high, and about the thickness of a man's finger; very flexible, and of a yellowish brown colour; internodes very long, almost equal. Leaves long, winged; leaflets ovate lanceolate, three-nerved. Spadix racemose. Spadix oblong, prickly. The three interior leaflets of the calyx white, having the appearance of petals. Berry rather large, brown; common in forests of the East Indies. Its stem cut into thongs, is used to make cables and other ropes, canoe chairs, and many kinds of household furniture. 5. C. longifolius. Beauv. t. 9, 10. "Leaves, winged, flexible, reflexed, gibbons at the base, and of a yellowish brown colour; internodes very long, almost equal. Berry long, winged; leaflets ovate lanceolate, three-nerved. Spadix racemose. Spadix obovate, prickly. The three interior leaflets of the calyx white, having the appearance of petals. Berry large, brown; common in forests of the East Indies. Its stem cut into thongs, is used to make cables and other ropes, canoe chairs, and many kinds of household furniture. Stem. Stems slender, very supple; internodes short, equal, smooth, furnished near their summit with alternate, winged leaves: leaves, alternate, from eight to ten inches long; pinnate, extended beyond the leaflets, but prickly to the end. Berry round, about the size of a pea. A native of humid, rocky places, in the island of Anhonia. It is in general use in the East Indies as a riding cane. 11. C. Solanii, Lour. Stem. Stem very slender; leaves and prickles shorter; flowers dioecious. Nearly allied to the two preceding. It may possibly be only a variety of one of them; or it perhaps is an intermediate species. Stem very slender, the leaflets of a goose-quill, twenty feet high, very flexible and regular, pale and glossy; internodes a foot long; leaves winged. Berry of little size; Calyx with its unequal divisions; the three inner ones resembling petals, white, ovate-lanceolate, fringed. A native of Cochinchina, on the banks of rivers. 12. C. calaba, Willd. Gard. Taf. 135. f. 1. Linn. Pl. 775. (var. [2] copied from Gaertner. C. rotang var. S. Willd.; Calabasas, ten rotang zalak, Rumph. t. 57, f. 2. Fructus Baty. inflatus: pyritiformes. J. Benth. Herb. p. 401, with a figure.) "Prickles spreading; spadix radical," Willd. Stem. Stems, in a tuft, from the crown of the root, from ten to twelve feet long, winged; leaflets long, acuminate; petioles strong, flat, spreading, prickly. Spadix racemose, nearly radical. Berries rather large, top-shaped, of an irregular form from their pustules and other parts; round, thin, papery; scales somewhat cartilaginous; the upper ones erect, the root pressed close, imbricated downward; marked with a raised line along the middle, and a little reflexed at the tip, so as to make the berry rough to the touch. Seeds three, fixed to the bottom of the berry, two generally abortive, nearly globular, with a small umbilical fleshy, thick, rather heart-shaped lobe allied to them below. Fruit. Fruit rather larger than a pea, of a pleasant acid flavour, which has been compared to that of the pineapple. They are eaten either raw or pickled, and are a general de-store. A native of Java, and other parts of the East Indies. This species has the habit of a palm, and connects the others with the Sago Palm. See SAGUS.

**CALAMUS**, in Ancient Geography, a place situated on the Thracian Bosporus, which is said to have taken its name from the quantity of roses which grew there.

**CALAMUS aromatites**, in Botany. See ACORUS Calamus.

**CALAMUS ascotterpus**, or calamus flabellum, among Fowlers, signifies a bird call.

**CALAMUS indicus petrifolius**, in the Natural History of the Ancients, a name given to a substance found often in the fofible kingdom usually of about three inches long, half an inch broad, and one third of an inch thick, and covered all
over its surface with large round figures in form of radiated stars within. This very much resembled in external appearance the root of our common *Calamus aromaticus* of the thorns turned into stone; and seems to have been vulgarly supposed to be that substance petrifed. The more accurate among the early writers, however, have by no means countenanced so wild a conjecture; and Theophrastus, though he records the substance under that name, as it had no other in his time, yet joins it to the corals, which, he says, grow in the sea, and are vegetables; and adds, that these and this substance are properly the substance of another treatise, not of a history of stones.

This author's placing it among the corals is perfectly right, since the speciments of it now found are plainly no other than corals of the related kinds, which have been long buried in the earth.

**Calamus odoratus**, Mathioli, in Botany. See Andrographum narthex.

*Calamus pashoralis*, in Myres, the shepherd's pipe; an ancient musical instrument, the origin of the flute: at first, made of a straw or reed; *sevena* and *calamus*. It should seem of the *musaeus, monoes*, with holes to produce different tones, must have been suggested by the syrinx, or Pan's pipe, an instrument in which pipes of different lengths, of one tone each, without ventificies, produced the scale by moving them over the lips; but afterwards it was discovered, (as it is said, by Minerva,) that one single pipe, perforated, would furnish as great a variety of sounds, and more conveniently, than all the pipes of the *flute* Panis. Flutes were improved and multiplied, almost to infinity. See Pl. of ancient musical instruments, and Hist. vol. i. pp. 408, and 412.

According to Horace, the flute had undergone various changes and improvements from its first invention:

* Tibia non, ut nunc, orichalco vindis, tubaque
  *Arumula; sed tenuis simplexque, foraminis paucis,
  Apfinare.*

A. P. 202. See Flute.

*Calamus scripторius*, properly denotes a reed or rush to write with, answering to the use of the ancient stylus and modern pen. The ancient Egyptian calamus was a sort of *arrow aquatic* growing plentifully about Memphis, and on the banks of the Nile; whence it was also called *calamus Memphis, Niloticus*, &c.

*Calamus scriputorius*, in Anatomy, is a dilatation of the fourth ventricle of the brain; so called from its figure, which resembles that of a quill. See Brain.

*Calamus* also denotes a sort of measure otherwise called *canne, cane*, or *reed.*

**CALAMY, Edmund**, in Biography, an eminent divine among the English Nonconformists of the 17th century, was born in London in the year 1600, and educated at Pembroke Hall in the university of Cambridge; where he took his degrees of bachelor of arts, and bachelor of divinity, but on account of his hostility to the Armenian party, he was prevented from obtaining a fellowship in that society, to which his standing, talents, and literary acquirements entitled him. His industrious difpersion and religious character, however, recommended him to Dr. Felton, bishop of Ely, who made him his domestic chaplain, and gave him the vicarage of Swaffham prior in his neighbourhood. In this situation, he studied at the rate of 16 hours a day, and acquired that large fund of solid and useful learning, which enabled him to discharge, with great ability, the several offices which he afterwards occupied. After the death of the bishop in 1626, he was chosen one of the lecturers at Bury St. Edmund's, and resigned his vicarage. During his 10 years' residence in this place, he distinguished himself for the most part as a strict conformist; but when bishop Wren's articles, and the reading of the book of Sports were enforced, he avowed his dissent, made a public apology for his conduct from the pulpit, and, from this time, was regarded as an undistinguished and active nonconformist.

Being much in favour with the earl of Essex, he was presented by his lordship with the rectory of Rochford in Essex, which, though a valuable preferment, was, on account of the infalubrity of its situation, the occasion of permanent injury to his constitution. In 1639, he was chosen minister of St. Mary, Aldermanbury, and removed to London, where he took an active part in the controversy concerning church-government, which was then agitated. In 1640, he engaged with other writers in the composition of the famous book, entitled "Sacramentum," from the initials of the names of those that were concerned in it; viz. Stephen Marshall, Edmund Calamy, Thomas Young, Matthew Newcomen, and William Spurliow. This treatise, though written with a considerable degree of asperity, has been considered, not only by the Nonconformists, but by Dr. Wilkins, bishop of Chelfer, as a capital work against episcopacy. Calamy himself says of it, that it gave the first deadly blow to this system of church government. In 1641, Mr. Calamy was appointed by the house of lords a member of the sub-committee, which ineffectually attempted to accommodate the differences that subsisted with regard to religion. And he afterwards distinguished himself, by his learning and moderation, in the assembly of divines. He was also at this time one of the most eminent preachers in the city of London, and held in high estimation, particularly by the Presbyterian party. With this party he concurred in opposition to the Independents and Sectaries, and in testifying his disapprobation of the violent measures that brought on the king's death, an event which he ardently deprecated. During the usurpation of Cromwell, he withdrew from all public concerns; but he boldly opposed the project of his single government, which he undertook to prove to be both unlawful and impracticable. As soon as a favourable opportunity occurred, he was active in promoting the restoration of Charles II.; and he was one of the divines delegated to compliment the king in Holland on the occasion. In 1660, he was appointed one of his majesty's chaplains; and he was offered the bishopric of Litchfield and Coventry, which, after previous deliberation, he declined accepting. As soon as the act of uniformity was passed, he consecutively discontinued his public sermons in the church, and preached his farewell sermon at Aldermanbury, August 15, 1662. He joined several of his brethren, however, in a petition to the king for liberty to retain their public functions, and on the occasion made a long and moving speech; but this last effort for toleration proved ineffectual. After he had ceased to officiate in the church, he attended its public service: at one time, viz. December 28, 1662, when the appointed preacher did not appear, he was urged by some of the principal parishioners to take his place; but taking occasion to speak with freedom concerning the parish, and the situation to which he was then reduced, he was arrested by the lord mayor's warrant, and committed to Newgate. Doubts, however, occurred as to the legality of his confinement; and the hardship of his case being duly considered, he was liberated in a few days by the king's order. After the fire of London, he was driven over its ruins in a coach on his way to Enfield, and the fight so much afflicted him, that he died within two months afterwards, October 29, 1666.

Mr. Calamy was well acquainted with the subjects appropriate to his profession; as a preacher, he was plain and practical; he boldly avowed his sentiments on all necessary occasions. Several of his sermons, delivered on particular
peculiar occasions, were printed separately; and a set of five sermons, entitled "The godly Man's Ark, or a City of refuge in the Day of Dilectis," was published in 1683, 12mo, and became a very popular book in those times. Biog. Brit.

Calamy, Benjamin, a divine of the church of England, of the 17th century, was the son of the preceding by a second wife, and having received the rudiments of education at St. Paul's school, he completed his course at Catharine Hall, Cambridge, of which he became a fellow, and an eminent tutor. In 1677, he was chosen minister of St. Mary, Aldermanbury, and soon after appointed one of his majesty's chaplains in ordinary; and in 1682, he took his degree of doctor in divinity. The attention of the public was very much engaged by "A Discourse about a scrupulous Conscience," which he published in 1683. It was dedicated to Sir George Jefferies, afterwards the chancellor of notorious memory, whom he compliments as his friend and patron. This discourse, which was designed to give the crime and danger of separating from the established church on the pretext of a tender conscience, and which inculcates the notion, that "such wayward, skittish confessions, as doubt of and suspect the rights of the crown, ought to be well briddled and restrained," was much decried by one party, and extolled by the other. Mr. Thomas de Laune, a Non-conformist school-master, published a warm reply to this discourse, for which, and some other intertemporal publications, he was committed to Newgate, and sentenced to pay a fine, which he was unable to discharge; so that the event proved fatal to himself, his wife, and children. It is alleged, however, in vindication of Dr. Calamy, that he exerted himself in favour of this antagonist; and that though he avowed himself a strenuous advocate for the principle of religious intolerance, and was unfortunate in the election of his patron, he was far from postfiling the spirit of a persectator; and it is further said, that his opinions on this topic underwent some change before his death. In consequence of the high estimation in which he was held by the best men of all parties in the city of London, he obtained in 1683 the visiting of St. Lawrence, Jewry, and in 1685, a prebend in the cathedral church of St. Paul. Towards the close of the year 1685, his health declined in consequence, as it is said, of the calamitous state of public affairs, by which he was deeply impressed, and he died of a pleuritic complaint in January, 1686. He was distinguished by his zealous attachment to the government and church of England; and at the same time respected and esteemed for his piety and charity, by persons of different denominations. As a preacher, he was much applauded: and some of his polished sermons, published by his brother, have been frequently reprinted, and are at this day read and admired. Biog. Brit.

Calamy, Edmund, an eminent dissenting divine, was grand-son of the first Edmund Calamy, by a father of the same name, and born in London, in 1671. After a previous course of education in some private and public schools, he was placed under the tuition of Mr. Samuel Cradock, by whom he was instructed in logic, metaphysics, and natural philosophy. In 1688, he removed to the University of Utrecht, where he distinguished himself by his proficiency in philosophy and law, under De Vries, Vander Mayden, and Grevius, some of the most learned professors in their respective departments at that period. In these several stages of education, Mr. Calamy recommended himself to his tutors by the diligence of his application, and to all his associates by the sweetness of his temper, and the urbanity of his manners. Having declined the offer of a professorship in the college of Edinburgh, he returned from Holland to England, and spent some time at Oxford, without becoming a member of the university, availing himself of the patronage and counsel of Dr. Pocock, and Dr. Edward Bernard, and also of the instructive conversation of Mr. Henry Dodwell. Determining to devote himself to the profession of divinity, he directed his course of studies to this object; and having deliberately investigated the grounds of the controversy between the established church and the Separatists, he resolved to connect himself with the latter; and in 1692, he commenced the regular exercise of his ministry at a meeting-house in Black-fryars, London. In 1694, he was ordained; and this was the first instance of the kind that was performed among the dissenters, after the passing of the act of uniformity: and in 1703, he was chosen pillar of a large and respectable congregation in Westminster. To the dissenters he performed an acceptable service, by publishing "Baxter's History of his Life and Times," which he afterwards abridged, annexing an account of many of the ejected ministers, and an apology for their non-conformity. Baxter's history terminated with the year 1694; but Calamy's continuation extended to the year 1691; and was published in 1702, 8vo. A new edition of this work was published in 1713, in 2 volumes 8vo, in which the history of the Non-conformists is continued through the reign of king William and queen Anne, to the time of passing the occasional bill. The third edition of this work was, as we may reasonably imagine, very differently received by persons of different parties and opinions; and it occasioned a controversy of some extent and continuance, which, however, was carried on with a greater degree of candour and moderation than most controversies of a similar kind. In Scotland, which Mr. Calamy visited in 1709, he was received with singular respect; and each of the three Universities of Aberdeen, Glasgow, and Edinburgh, presented him with the degree of doctor in divinity. In 1718, he wrote a vindication of his grandfather, and several other worthy persons against the reflections of Archdeacon Eachard, in his History of England. About this time the question of subscription to the first article of the Church of England, relating to the Trinity, began to be agitated among the dissenters; Dr. Calamy, however, remained neutral, and he has incurred reproach among the present race of dissenting clergy, for not having joined those 53 ministers who carried it against 69 for the Bible, in opposition to human formulaires. As to the belief of the doctrine he was decidedly orthodox, which was also the case with several others; and he published a set of sermons in defence of it, which was dedicated and presented to the king, and for which he received from his majesty a gratuity of 50l. and likewise the thanks of several dignitaries of the church. In 1727, he completed his great design of preserving the history of ministers, &c. ejected and silenced, after the restoration, in a work intitled, "A Continuation of the Account of the Ministers, Lecturers, Malters, and Fellows of Colleges, and Schoolmasters, who were ejected and silenced after the Restoration in 1660, by, or before the Act of Uniformity, &c." 2 vols. Lond. 1727. This is a work of laudable industry and labour, and contains a valuable collection of memoirs, which would have been otherwise lost. In 1735, the rev. Mr. Samuel Palmer of Hackney published in two large volumes 8vo, under the title of "Non-conformists Memoir, an abridgment, with corrections, additions, and new anecdotes, of Dr. Calamy": 4 volumes, concerning the ejected and silenced ministers; and a new edition of this work, with improvements, has been lately reprinted. Dr. Calamy distinguished himself by other learned and useful writings, confining chiefly to sermons and controversial pamphlets. Of his publications, besides those already noticed,
ed. we may mention his "Inspiration of the Holy Writings of the Old and New Testament, in 14 Sermons;" and "His Defence of moderate Nonconformity," in 3 parts. The introduction to one of these tracts, representing the true state of the controversy between the Church and the Diftants, was so much approved by Mr. Locke, that he sent a message to our author informing him, that he thought it such a defence of nonconformity as could not be answer'd; and that, in adhering to the principles thus laid down, he had no occasion to be afraid of any antagonist. After an honourable course of professional services for which he was much esteemed, and after sustaining a character which was much respected, not only among dissenters, but also among the moderate members of the established church, both clergy and laity, with many of whom he lived in great intimacy; he closed his life June 3, 1792, in the 66th year of his age. In his funeral sermon by Mr. May, his character is very justly delineated, as "a person of sound judgment, extensive learning, sincere piety, of a candid and benevolent temper, and very moderate with regard to differences in points of religion." [C. 325.]

CALANDA, in Geography, a town of Spain in Arragon, on the river Guadaloupe; 3 leagues W. S. W. of Alcaniz.

CALANDRA, in Ornithology, a bird of the Alauda, or lark genus, called by some the calandrea lark, and which appears to be a general inhabitant of Sardinia, Italy, the South of France, Syria, Russia, and Tartary, and also of America. This is the calandra of old authors. Briffon calls it aluda major f. calabra: it is the calandra of the arctic zoology, of Aldrovandus, Willughby, and Edwards, and grofie alouette on calandre of Buffon. The length of this bird is about seven inches and a quarter. It builds its nest on the ground: sings finely, and imitates the notes of other birds extremely well. It is specifically distinguished by having the first exterior tail feather on each side white on the outer web; second and third with white: pectoral band brown. Gmel. &c. Obs. The bill and legs are pale grey: body above varied with brown and grey: chin white: throat with a white crescent, and beneath that a whitish band spotted with black: belly white: quill feathers dusky edged with white: the lesser ones with white: tail black.

CALANDRE, in Natural History, a name given by the French writers to an insect that does rull mischief in granaries. It is properly of the scarab clafs.

The female lays a considerable number of eggs, and the increase of these creatures would be very great, but nature has so ordered it, that while in the egg state, and even while in that of the worm, they are subject to be eaten by mites: these little vermin are always very plentiful in granaries, and they destroy the far greater number of these larger animals.

CALANDRO, in Geography, a town of Alsatian Turkey, in the province of Caramania; 100 miles S. of Cogni.

CALANGAY, in Natural History, a name given by the people of the Philippine islands to a species of parrot very common there; it is all over white, and has a cireil of white feathers on its head; it is of the size of a pigeon, and is easily kept tame, and learnt to talk. It is called also in some of the Philippines catata and abacay.

CALANNAS, in Geography, a town of Spain, in the county of Seville, near the river Odei; 40 miles N. of Seville.

CALANTIGAS, an island of the East Indian ocean, not far from Lingen, which see.

CALANUS, in Biography, a brachman or Indian philosoper, who followed Alexander the Great, in his expedition to India. Having passed 83 years without sickness, a feat of the colic made him impatient of life, and he resolved to render his exit as elegant as possible. Accordingly, having obtained permission of Alexander to burn himself, a funeral pile was erected and drawed with perfumes; and the whole army was arranged round it in battle array: upon which, Calanus, magnificently dressed, ascended the pile with a composed air, and saw the flame applied without emotion. When he was asked if he had any message to Alexander, he only replied, "I shall soon see him again at Babylon!" which declaration some have interpreted as prefigurative of his death in that city; and the last words he uttered were, "Happy hour of departure from life, in which, after the mortal body is consumed, the soul shall go forth into light." This event took place on the borders of the Indus, 20. C. 325. See Alexander.

CALAO, in Ornithology, synonymous with the modern Latin Bacucos, and Hornbill of the English. Petiver called the Philippine hornbill (Bicornis Linn.) Calao, and since that period, the French have adopted the expression as a generical name for the other species of the same tribe. Thus, Buffon has calao d'Abyfianie, calao d'Afrique, calao de Malabar, calao de casque rond, calao à bec rouge de Senegal, &c. all which refer to the corresponding synonyms, Abyfianian hornbill, African hornbill, Malabar hornbill, Helmet hornbill, red-billed hornbill, &c.

CALAON, in Ancient Geography, a river of Asia Minor, in Ionia, near the town of Colophon.

CALAPADA, in Geography, a cape on the north side of the isle of Candia, to the east of cape Melche, and about one-fourth part of the length of the island from the west end.

CALAPIS, in Ancient Geography, a colony of Asia Minor, in Bithynia; established, according to Strabo, by the inhabitants of Heraclia.

CALAPIZZATI, in Geography, a town of Naples, in the province of Calabria Citra; eight miles N.W. of Catrini.

CALAPPA, in Botany, Rumph. See Cocos mefera.

CALAPPA, in Entomology, a species of Cancer that inhabits America. The thorax is crenelated, with the posterior angles dilated, and very entire; hand-claws crested. Fabricius.

CALASCIO, in Geography, a town of Naples, in the province of Abruzzo Ultra; eight miles E. of Aquila.

CALASCIONE, a musical instrument much in use by the Turks and their musicians throughout the kingdom of Naples. It is a species of guitar, with only two strings, tuned 8th to each other. It has a very long neck, which is fretted. See fret. The Turks have an instrument of the like kind, with three strings, called in Arabic, dambara. Sometimes the strings are struck with a plectrum, and sometimes with a quill. See Plectrum. The tone is rough and coarse; the neck is sometimes fixed long. The frets amount to 15 or 16. But the Napolitans have a smaller sort called callifoneca. See Maj. Pl. of mod. ital.

CALASH, or Cales, a small light kind of chariot, or chair, with very low wheels, used chiefly for taking the air in parks and gardens.

The word is French, caleche, which Menage derives from the Latin, carrus, carri, carifius, carriffa, carrifis, calefis, calefis, caleche.

The calash is for the most part richly decorated, and open on all sides, for the convenience of the air, and protected; or at most enclosed with light mantlets of waxed cloth, to be opened or shut at pleasure.
In the Philosophical Transactions, we have a description of a new sort of calash going on two wheels, not hung on traces, yet easier than the common coaches; having this further advantage, that whereas a common coach will overturn if one wheel goes on a surface a foot and a half higher than that of the other, this will admit of a difference of three feet and one third, without danger of overturning. Add that it would turn over and over, that is, after being turned so as that the spokes are parallel to the horizon, and one wheel flat over the head of him that rides in it, and the other flat under him, it will turn once more, by which the wheels are placed in *flata quo*, without any disorder to the horse or rider. N. 172. p. 1628.

CALASIO, MARCIUS DE, in Bibliography, a Franciscan, professor of Hebrew at Rome, and author of "Concordance of the Hebrew Words in the Bible," in four volumes folio, printed at Rome in 1621, and at London in 1747. This Concordance has been highly approved both by philosophers and papists; and contains, besides the Hebrew words occurring in the Bible, the Latin version, and, in the margin, the variations between the LXX version, and the Vulgate. Besides, at the beginning of every article, there is a kind of dictionary, which gives the signification of each Hebrew word; and it furnishes an opportunity of comparing it with other oriental languages, viz. the Syriac, Arabic, and Cilacide.

CALASIRII, in Ancient Geography, the denomination of a people, who, according to Herodotus, formed a clan of Egyptians, amounting in number to 250,000 persons, devoted, from father to son, to the profusion of arms, without being attached to agriculture, or to any art. The kings of Egypt had always one thousand of them among their guards.

CALASIRIS, or CALASIS, in Antiquity, a linen tunic worn by the Phcenician, Egyptian, Roman, and other priests. We also find mention of the calasiris as worn by the soldiers and by women. In which half clothes, it seems to have been a habit in the women's gown, whereby it was drawn about the neck.

CALASTRI, in Geography, a town of Hindostan, in the Carnatic; 15 geographical miles E.N.E. from Tripetty, and 61 from Arcot: but major Rennell has some doubts concerning the accuracy of its position.

CALATABELLOTTA, formerly the Crimijs, a river of Sicily, with the waters of which the inhabitants overflow their beautiful rice grounds; and also a town of Sicily in the valley of Mazzara; six miles S.E. of Sciacca.

CALATAFIMI, a town of Sicily, in the valley of Mazzara; 19 miles E.S.E. of Trapani. It is built on a ridge between two valleys, and its inhabitants are estimated at 10,000.

CALATA-GERONE, or CALACIRONE, a royal city of Sicily, in the Val di Noto, situate about 20 miles from the sea, on the summit of a very high infalded hill, embosomed in thick groves of cypresses, and containing about 17,000 inhabitants, who live by agriculture and the manufacture of potters' ware. The road to it, though paved, is very steep, and difficult of passage for any animal except a mule or an ass. The inhabitants of this city are deemed the politest people in the island, and many of them live in a very elegant style. The natives have an idea that this city is very ancient, and that it figured as a republic among the Sicilians, during the zenith of Grecian glory, under the name of inland Gela or Gelone. The Saracens fortified it, but the Genoese wrested it from them; however, their force was dwindled into a shadow when the Normans arrived. Earl Roger availed himself, on many occasions, of the treaty va-
CALATRABA, Knights of, in History, a military order instituted in 1158, by Sancho III, king of Castile. In the following order. When the Moors proposed to attack the little city Calatrava, the Templars, who held it, surrendered it up to the king, on a promise of their inability to defend it; upon this, Diego Velazquez, a Cisterian monk, but a man of quality, perfumed Raymond, abbot of Fitero, a monastery of Cistercians, to beg Calatrava of the king. He obtained it; and Raymond and Diego put themselves in it; being followed by a great number of people who joined them out of zeal, for the defence of Calatrava. The Moors abandoning the enterprise, many of those who came to the defence of the city, entered under the order of the Cistercians; and that under a habit more fit for military than monastic exercise. Accordingly, they began to make excursions on the Moors; and this was the rise of the order of Calatrava.

The first grand master was Gracián; under whose government the order was approved by Alexander III. in 1159, and confirmed by Innocent III. in 1198. In 1289, Ferdinand and Isabella, with the consent of pope Innocent VIII., reunited the grand mastership of Calatrava to the Spanish crown; so that the kings of Spain are now become perpetual administrators, or great masters of this order. The badge of the order is a cross flory gules, which is worn at the stomach pendant to a ribbon.

Their rule and habit were originally those of the Cistercians, but their dres was a little shortened, on account of their exercises; and in process of time they were permitted a secular habit. The present habit of ceremony of the order is a mantle of white silk tied with a cordon and tassels, like those of the garter; and on the arm, a cross flory embroidered gules. Mariana observes, that this noble institution has gradually degenerated: the commanderies, which were formerly the reward of military merit, being frequently bestowed on minions and favourites. The order is said to have at present 34 commanderies, and eight priories, which produce an annual revenue of £50,000 a year.

As the order of St. James is distinguished by the epithet of the rich, and that of Alcantara is styled the noble, this of Calatrava is entitled the gallant.

Alphonus IX. having recovered Alcantara from the Moors, in the year 1212, committed the custody and defence thereof, next to that of the knights of Calatrava; and two years afterwards to the knights of the Pear-tree, or of St. Julian, another military order instituted at Peresio, in 1156, under the protection of Ferdinand II. king of Leon, and raised as a religious order under the title of St. Benedict, by pope Alexander III. in 1177, at the request of Gomez Fernandez, the first prior or grand master; and on which, they changed their name, and assumed the denomination of the knights of Alcantara. The king of Spain is sovereign of this order, which is in high estimation in that kingdom; the mantle worn by the knights of this order is of red silk, with a flap of five points embroidered on silver on the left breast. The badge is a cross flory of gold, enamelled vert, and worn at the bosom with a broad ribbon.

The religious order of Calatrava for ladies was instituted by Don Gonzalez Yanes in 1229. The badge of the order is the same as that worn by the knights of Calatrava, only embroidered on the front of the ladies' habits.

CALATUM, in Ancient Geography, a town of Britain, in the country of the Brigantes, according to Ptolemy. It is placed by Horsey at Appleby, and by Baxter at Kirkby-thorpe in Westmorland. But both the name, and the relative situation assigned to it by Ptolemy, might incline us to place it in or near the Galaterium Nemus, now the forest of Galters in Yorkshire. In the itinerary of Antonine, it is denominated Galacum, and placed 47 miles from Brometum.

CALAU, in Geography, a town of Leptis, which carries on a large trade in wool; 15 miles N.W. of Cothas.

CALAU-CEN, a town of Egypt; 12 miles S. of Abu Girgê.

CALAVON, a river of France, which runs into the Durance, about 8 miles W. of Caunaion.

CALAURES, in Ancient Geography, a river of Afia Minor, in Phrygia, which ran, according to Livy, between Chyra and Mandropolis.

CALAURIA, one of the Greek islands in the Argolic bay, situate, according to Strabo, in the bay of Hermione, over against Trozen, a maritime city of Argia, from which it was distant four furlongs, being itself 30 in compass. It was famous for a temple consecrated to Neptune, and an asylum. Democritus was an exile in this island, and was buried in the temple, after having poisoned himself, because he would not surrender to the order of Antipater. In the time of Paulus, the inhabitants and strangers paid great respect to the memory of this illustrious orator. This island was also denominated Irene. Anthedonias, Hypericis, and Poliddonia; however, Pliny distinguishes Irene from Calauria. Ancient tradition reports, that Latona gave this island to Neptune in exchange for that of Delos, whence the proverb, "Pro Delo Calauria." A fort of lighthouses, denominated "Calauri," was brought to the Greeks from this island, and applied by them to medical purposes.

CALAURIA, a town of Sicily, mentioned by Plutarch.

CALAUWE, in Geography, an inhabited island of the Indian Ocean, near Saleyrer, (which feel), and belonging to it. It is chiefly inhabited, as well as Bonarette in its vicinity, by Bruginefe.

CALABARI, or CALABAR, the name of two rivers, as well as of a district in Africa, called Cape Formosa. See CALABAR.

CALABARIA, a province of Africa, adjoining to Rio Real, or Royal River, called also Calabar; deriving its name from that river, which, though broad, is too shallow to be navigated by ships of burden. Near the coast, on the west bank of it, is a town called by the Dutch, Wyndorf, and by the negroes, from the great quantity of wine, Tooke; two branches spread to the east and west from the river, whose course runs constantly north. In the west branch is a road, three or four leagues long, for trading vessels; and the town Calabar is situated on the north side of this arm, and is a place of great trade with the Dutch, enclosed with palisadoes, watered on the south by the river, and defended on the north by a boggy wood. On the south of this rivulet is an island of an oval figure, at a distance from the continent, from which it is divided only by a shallow canal, the land low and covered with woods. About 12 leagues westward of Calabar, lies Beli, governed by one captain; and 20 leagues above the mouth is an arm of Rio Real, running east-north-east, and many other rivers are near the banks. The province of Kriker, belonging on the west bank of Moco, lies about 20 miles from the coast; on the back of Rio Real, southward of Moco, towards the coast, is the province of Bani, whose chief town is Cuba, the principal of this country, which extends westward from the river Calabar, as far as Sangma, and has ten under officers. The cannibals, negroes, inhabitants of the eastern banks of Calabar, circumcise the women that are marriageable, cut only the face, and sell the prisoners of war at Calabar. The canoes used by the Calbarian negroes are pointed at both ends,
ends. 60 feet long and six broad, with a fire place in the centre for dressing victuals, and planks across for rowsers. Near each rower hangs a quiver of arrows, in case of an attack; these rations being in continual war. The canoes carry 80 persons: the lives only are exposed to the damps of the air, the mourners being sheltered in the night by red mats spread upon poles, and fixed in the form of tents. At the end of Lontoba river, called by the Portuguese Rio do Santo Antonio, which is three leagues from the mouth of Rio Real, is a large town inhabited by negro traders, who traffic in slaves, which they bring from distant countries. Next to Lontoba is Old Calbaria, or Colborg river. The interjacent country is supplied with water: the town from Rio Real to ancient Calborg is 24 leagues in extent, north-north-west. See CALABAR.

CALBE, a town of Germany, in the circle of Lower Saxony, and district of Magdeburg, on the Saal; 20 miles S. of Magdeburg.

CALBE, or KATZE, a town of Germany, in the circle of Upper Saxony, and district of Brandenburg; 8 miles from Gerd-Jesen.

CALBERGA, a town of Hindostan, in the country of Hyderabad, formerly a large city, and the residence of the Kings of the Deccan; but now lost populus, since it ceased to be the seat of royalty; 8 miles W. of Hyderabad, and 110 miles S. of Vellore. N. lat. 17° 25', E. long. 77° 25'.

CALBIS, a town of Egypt, 3 miles N. of Rosetta.

CALCIS, in Ancient Geography, a river of Aisa Minor, in the Doric, according to Ptolemy, and in Asia, according to Pompianus Mela. They call it Indus, and says it is sprung from the mountains of Cbya, and that it received in its course 60 rivers, and more than 100 torrents. Its mouth was in the north-west part of the gulf of Glausus, W. of the promontory of Pelusium.

CALBONGA, in Geography, the inhabitants of a country in Africa, which is near the source of the river Río do Rey, or the Kings River, and borders on Bafra, at a distance from the coast. They are described as a wicked, deceitful, and filthy people, who are naked, except that they cover their private parts, and who bedazzle their bodies with various colours, and figures traced on their foreheads. They are represented as delinquent of natural affection, as well as sincerity, innumerable that parents fell their children, husbands their wives, and brothers their fathers. In this country, those that are declared innocent, who make an illusion and suck the blood out of their arms. See Río do Rey.

CALBUCO, a town of South America, in the kingdom of Chili, and military government of Chiloe, on the coast of the south Pacific Ocean, inhabited by Spaniards, Moluscos, and Indians, with one parish church, a convent of Franciscans, another of the Fathers of Mercy, and a college of Jesuits. In this town resides a Corregidor, who is nominated by the President of Chili. It is 180 miles S. of Valdivia. S. lat. 42° 40', W. long. 73° 32'.

C. ALBUM, in Entomology, a species of Cuculio found in Europe, and defended by Scopoli. This insect is variegated with copper and black, and is particularly distinguished by having an incurved line on the wing-edges at the base, next to the external angle.

C. ALBUM, is also the specific name of a well known species of the European Papilionae, called in England the comma butterfly. This insect has the wings angulated, fulvous spotted with black; posterior wings beneath marked with a white curved line resembling the letter C, whence its name. See C. ALBUM.

CALCADA, in Geography. See CALABAR.

CALCAGNIUM, in Middle Age Welsh, a tax or contribution paid by the neighbouring inhabitants towards the making or repairing of a manor canaley.

CALCAGNINI, Crisio, in Biography, a learned Italian, who was probably the illegitimate son of the apostle Paul. His monastic order was at Ferrara, and born in 1570. Having come to Rome, after the completion of his studies, under the patronage of Maximilian, and pope Julius II., he was employed in various embassies, and returned from Hungary, whither he had been sent to the church of Ferrara, in 1518, he was made professor of belles-lettres at the university of Ferrara, where he held till his death in 1541. He was distinguished by his promotion of the Academy, "Deu Elvetius," in that city, and by the liberal donation of his valuable library, and collection of mathematical instruments to the Franciscans of Ferrara, on condition of their preferring them for public use. He wrote much both in prose and verse. His prose works were collected by Frobenius at Basle in 1444. Among those that relate to antiquities are, the 3 books, "Quaelibet in Egyptia," and his treatises, "De Re Coptica," and "De Nautica," and "De Tabula, Taferinum, et Calculo," etc. Others relate to philosophy, morals, and politics. Before Cephalus published his system, he wrote a book to prove, "Quod China est, China moneatur." Enthusiastic highly applauds this author; though others condemn his style as laboured and overcharged with quotations. His poetical style was more effective. Three books of his Latin poems were published at Venice in 1553, with those of Tindia and Ariosto. Traboschi.

CALCANEUM, or CALCANUS, in Anatomy, the same as calcis, os calcis, or the heel bone.

It lies under the astragalus, to which it is articulated by ginglymus; behind it is a large protuberance, which makes the heel, and into which the tendon achillis is inserted.

CALCANTHUM, in Mineralogy. See Vitriol.

CALCAR, in Anatomy, the same with CALCANTHUM.

CALGAR, of Kelkar, John, in Biography, a painter of history and portrait, was born at Calgar in 1470, and excelled so much as a disciple of Titian, that several of his designs and paintings have been ascribed even by Goltzius to this eminent master. Sandart states, that he also imitated the works of Raphael so exactly, that some of his productions have been esteemed to be Raphael's own. His "Nativity," which was a much admired composition, and which exhibited the light proceeding from the infant, was in the possession of Rubens; and after his death purchased by Sandart, and sold to the emperor Ferdinand, by whom it was very highly prized. Calgar designed all the heads for the works of Vafari, and the anatomical figures in those of Vetus. He died in 1546. Pikington's Dictionary by Fitch.

CALCIS, in Botany, a conic projection from some part of a flower resembling a cock's spur. Tropozonum, the institution of, or Indian creas of the gardeners, is an influence of a calcar or spurred calyx; delphinium, or larkspur, of a calcar corolla; and orchis of a calcar nectary.

CALCIS, in Canthology, a species of Turbo, the shell of which is somewhat perforated and depressed; whose februous; spines above compressed and hollow. Linnaeus, etc. This is the Calcar of Rumphius and Argenville. Chemnitz gives several distinct varieties of this shell from India, the South Seas, and the Mediterranean.

CALCAR, a species of Nautilus, found in the Adriatic Sea, and described by Plancius among his microscopic shells.
flakes. It is distinguished specifically by the aperture being of a linear form, and having the joints of the whorls elevated.

This is a minute shell of an opaque white colour, and has been found on the shore of Shetland island.

**Calcari**, in *Fossilogy*, a species of *Cerambyx*, the colour of which is black: thighs with a single tooth: antennae and feet tawny. Fabricius. This is a small insect, and inhabits Germany.

Calcari, in *Geography*, a town of Germany, in the circle of Wasphalia, and duchy of Cleves, about 5 miles from the Rhine. It contains two convents and two churches, one for Roman Catholics, and one for Protestants, and all other sects are tolerated; 7 miles S.E. of Cleves. N. lat. 51° 47'. E. long. 5° 41'.

Calcari, in *Gips-making*, is the name of a small oven, or reverberatory furnace, in which the first calcination of sand and falt of pot-aloes is made, for the turning them into what they call fre.

**Calcariat**, in *Entomology*, a species of *Buprestis* that inhabits Germany. The wing-cases are bidentated, and somewhat frayed; thanks of the middle pair of legs toothed; body coppery. Scholl. Heribit gives this the name of *Buprestis argenniogin*.

Ob. This is of a small size, with four lines on the wing-cases, and a single black blue line on the thorax.

**Calcarius**, an European species of *Cerambyx*, of a violaceous-black colour, with rufous thighs, the posterior ones dentated. Sop. Ann. Hilt.

**Calcarius**, a species of *Cimex*, of a fuscous colour, with the abdomen fumaceous above, and the posterior thighs fuscous. Fabricius. Inhabits Europe.

**Calcaceous**, something that partakes of the nature and qualities of *calc*., or lime.

**Calcaceous cements.** See *Cements calcareous*.

**Calcaceous earth.** See *Lime*.

**Calcaceous earth, in Agriculture*, a sort of earth in which calcareous matter abounds. Earths of this kind have the following properties in common:—They become friable when burnt in the fire, and afterwards fall into a fine white powder, which is promoted, if after being burnt, they be thrown into water, by which a strong heat arises, and a partial solution takes place.

They cannot be melted by themselves into glasses in a close fire; but when burnt, they augment the cavaliety of pot-aloes, and they are dissolved in acids with effervescence. This earth is found pure, in the form of a powder, in some places, and called by chemists *litharge*. It is of a white colour, and is met with in some moory situations, at the bottoms of lakes, and in the fissures of free-stone quarries, in some of the midland districts.

In some countries, as Sweden, the colour varies to red and yellow. This is supposed to be lime-stone washed from the rocks, and pulverized by the motion of the water. It is, however, found in quantities too small to admit of any applications to agricultural purposes. It is frequently met with in a friable or compact slate in the form of chalk. The white chalk is the purest, yet it contains, according to Lord Dundonald, a little silicious, and about two per cent. of argilaceous earth. There is more fixed air in chalk than in any other calcareous earth, generally about forty per cent. It is also seen in a hard or indurated slate in lime-stone; and united with the sulphuric or vitriolic acid, in the form of gypsum, selenite, or what is generally termed plaster of Paris. It is likewise combined with clay in the form of marl. See *Lime-stone, Gypsum, and Marl*.

It is maintained by lord Dundonald, in his treatise on the "Connection of Agriculture with Chemistry," that it constitutes not only the surface, or soil, but likewise the under stratum of many countries to a very great depth; and that under this general name of calcareous matter are included chalk, marble, lime-stone, coral, shells, &c. The three first mentioned are frequently mixed with iron, and with different proportions of the simple earths, but are considered as calcareous when the proportion of that earth predominates. This material is capable of absorbing, and of retaining moisture, though in a considerably less degree than clay. By the action of the fire it becomes lime, and returns again to the state of chalk or calcareous matter, by exposure to the air or atmosphere." And it is slated by Dr. Fordece, in his "Elements of Agriculture and Vegetation," that when combined with gas or fixed air it is termed *vitrill*, but that when free from it, it is *calcite*; that calcareous earth, when mixed with clay, gives a greater friability to it than sand does; that it unites with sulphur, forming *bipar sulphur*; and with animal and vegetable substances, forming a *coprolite*. It prevents putrefaction. It attracts acids more strongly than volatile alkali or magnesia. If it be exposed to the air, it attracts from it the fixable air, and returns to the state it was in before it was burnt. Mould calcareous earth forwards putrefaction. It is soluble in water, and when reduced to the state of a powder, and applied to a soil, it is apt to be washed through it. Calcite volatile alkali will not precipitate calcareous earth, if dissolved in an acid; but fixed vegetable alkali will. This distinguishes it from the other earths. Vitriolic acid will not dissolve it, so as to form a clear solution; and if this acid be added to a solution of it in any other, it will make a precipitation.

It is suggested by the author of *Phytologia*, that one great use of calcareous earth consists in its uniting with the carbon of the foal in its pure or calcite state, or with that of the vegetable or animal remnants, during some part of the process of putrefaction; and thus rendering it insoluble in water, by forming an *arsenical carbonate*. This is a method by which an *arsenical carbonate* is produced by lime and sulphur, by which, proceeds, it is supposed, the carbon is rendered capable of being absorbed by the leaves of vegetable roots. The black liquor which flows from dunghills, it is thought, probably a fluid of this kind; but the author speaks hypothetically, as he has not verified it by experiment; and the carbon may be simply supported in the water by mucilage, like the coffee drunk at our tea tables; or may be converted into an *arsenical carbonate* by its union with the fixed alkali of the decaying vegetable matter, or by the volatile alkali which accompanies some stages of putrefaction." And a second mode by which it is believed to fulfill the purpose of vegetation "is by its union with carbo-cyclic acid, and rendering it thus soluble in water in its fluid state, instead of its being expanded into a gas; and thus a great quantity of carbon may be drawn up by vegetable absorptive vessels. In the practice newly invented of watering lands by driving streams over them for many weeks together, it has been said, that water from springs is generally more effectual, in promoting vegetation, than that from rivers; which, though it may in part be owing to the azotic gas, or nitrogen, contained in some springs, as those of Buxton and of Bath, according to the analysis of Dr. Priesley, and of Dr. Pearson, yet it is supposed to be principally owing to the calcareous earth, which abounds in all springs, which passes over marly foils, or through calcareous strata; and which does not exist in rivers, as the faults washed into rivers from the soil all seem to decompose each other, except the marine salt, and some magnesian salt which are carried down into the ocean. The calcareous earth likewise, which is washed into rivers, enters into new combinations, as into gypsum, or perhaps into siliceous sand, and subfuses." And a still farther mode in which
which calcareous earth may promote vegetation, it is conceived, "by its containing phosphorus, which by its union with it may be converted into an aspir, and thus rendered soluble in water without its becoming an acid, by the addition of oxygen. Phosphorus, it is supposed, is probably as necessary an ingredient in vegetable as in animal bodies; which appears by the phosphoric light visible on rotten wood during some stages of putrefaction; in which, it is supposed, the phosphorus is set at liberty from the calcareous earth, or from the fixed alkali, or from the carbon of the decomposing wood, and acquires oxygen from the atmosphere; and both warmth and light are emitted during their union. But phosphorus may, perhaps, more frequently exist in the form of phosphoric acid in vegetables, and may thus be readily united with their calcareous earth, and may be separated from its acid, by the carbon of the vegetable during calcination, and also during putrefaction, which may be considered as a slow combustion. The existence of a solution of phosphoric acid and calcareous earth in the vesicles of animals is proved by the annual renovation of the shells of crabfish, and by the fabrication of the egg-shells in female birds; and is occasionally observed, where it cements the wounds made on snail shells; or where it joins the present year's growth of a snail shell to the part where a membraneous cover had been attached for the protection of the animal during its state of hibernation; and lastly, it is further evident from the growth of the bones of quadrupeds, and from the deposition of callus to join them when they have been broken." It is therefore contended, that "many arguments may be adduced to show, that calcareous earth, either alone, or in some of the states of combination, mentioned above, may contribute to the nourishment and support of both animals and vegetables. First, because calcareous earth constitutes a considerable part of them, and must of course be either received from without, or formed by them, or both; and secondly, because from the analogy of all organic life, whatever has composed a part of a vegetable or animal, may again, after its chemical solution, become a part of another vegetable or animal; such, it is observed, is the transmigration of matter. See Lime and Natron.

Calcareous manures, are all such as abound in calcareous matter. Chalk, pounded lime-stone, lime, calcareous marl, shells, and various other substances of a similar kind are of this description. They are found particularly beneficial on all the flatter forts of soil when made use of in due proportions.

Calcareous soils, such as are composed of this sort of material in a large proportion. From their dry and friable nature, soils of this nature are in general well suited to the growth of most sorts of grain, as well as to some plants of the artificial graft kind, such as clover, foin, &c. See Soil.

Calcareous sand. See Lime-stone.

Calcaria, in Ancient Geography, thought by some to be Calysene, a city of Gallia Narbonensis, upon the Aurelian way, west of Aquitaine.

Calcaria, a town of Ancient Britain, 9 miles from Eburacum and 20 miles from Cambodunum, according to the itinerary of Antonine, placed by some at Tadeacor, by others at Newton-burke.

Calcaniares, in Geography, a jurisdiction of South America, in the country of Peru, situate between Cufco and the sea, and commencing 4 leagues west of the city of Cufco. The air in this jurisdiction exceeds that of all the other provinces, and accordingly it produces an excellence of all kinds of grain and fruits. In the hottest parts called "Lares" were formerly very large plantations of sugar canes, but for want of hands to cultivate them, they are now so diminished, that instead of 60 or 80,000 acres which they annually produced, they are now reduced to less than 30; but the sugar is of such an excellent kind, that without any other preparation than that of the country, it is equal both in colour and hardness to the refined sugar of Europe. This diminution of its sugar has greatly lessened the principal branch of its commerce.

Calcearium, or Calcarium, in Antiquity, a donative, or large bequest on the Roman soldiers for buying shoes. In the monasteries, calcarium denoted the daily service of cleaning the shoes of the religious.

Calcemonials, a denomination given by Cop to writings for the Melchites, on account of their adherence to the Council of Caledon. See COPHYS, MONOPTERIS, &c.

Calcemonialus is a term used by the jewellers for a defect in some precious stones, when, in turning them, they yield white spots, or flakes, like those of the calcendy, or chalcedony. This defect is frequent in granites and rubies. The lapidaries usually remedy it by hollowing the bottom of the stone.

Calceldon. See Chalceldon.

Calcena, in Geography, a town of Spain in Arragon, 14 miles S. of Tarracon.

Calcena, a term used by some medical writers to denote a morbid tartsorm in the body.

Gen. ch. Cal. one-leafed, with four, equal, spreading divisions; permanent. Car. monotelous, bilabiate, inverted; upper lip very small, constrictedly globular; lower lip large, inflated, concave, flipper-shaped, gaping before. Stam. filaments two, very short, within the upper lip; anthers inbent, two-lobed. Fil. stem superior, roundish; style very short; stigma rather obtuse. Peric. capsule somewhat conic, two-furrowed, two-celled, two-valved. Seeds numerous, egg-shaped.

A native of Peru and Chili. "C. orastra. Smith in loc. ind. 1. t. 3. C. dichotoma. Linn. in Flora, C. integrifolia. Linn. Supp. "'Stem branched, leaves egg-shaped, foliollad." Smith. Pubescent in all its parts. Roset annual, filiform. Stem slender, round, diichotomous, seven or eight inches high. Leaves small, opposite; upper ones sessile, truncate; lower ones corded and rather obtuse. Flowers small, yellow, on firm peduncles, solitary and terminating. Found in Peru by Humboldt. It flowered in the royal gardens at Paris in 1761. C. f. p. flaccid a. Linn. Sup. Mus. Amer. v. 1. t. 3. Smith in loc. ind. 1. t. 5. "Leaves perfoliately, arrow-shaped, downy on both sides." Smith. A hardy plant, very different in its appearance from all the other species. Stem about a foot and half high, round, pubescent, branched. Leaves opposite, triangular, or almost arrow-shaped, irregularly toothed, woolly and white beneath. Flowers yellow, large, in clusters at the tops of the branches, on simple or branched peduncles. Calyx large. Petals reflexing toward the leaves, but egg-shaped and feljite, not perfoliate. Found in North America by Maton, and in Peru by Joseph Jussieu. 5. C. c. Willd. La Mark. "Leaves sessile, oblong, acute, foliollad, flowers in cymes terminating the stems and branches." Stem about two feet high, downy. Leaves opposite, almost embracing the stem, resembling those of Rhamnthus crista gali, green above, downy and pale beneath. Found in Peru by Joseph Jussieu. 6. C. f. varii-<br>
I. C. varii-<br>
specie, Willd. La Mark. "Leaves linear, very entire, reflexed at the margin, downy beneath; stem smooth." Stem about a foot and half high, round, more or less branched. Leaves opposite, smooth and viscid above, especially when young. Flowers yellow, in terminating cymes on smooth, viscid peduncles. Found in Peru by Joseph Jussieu. 7. C. p. Wiliil. Smith in Ind. 1. t. 2. La Mark. "Scapes with few flowers; leaves rhomb-shaped, serrated." Leaves only from the root, veined, smooth, fringed with jointed hairs, narrowed at their base into petioles, about two inches long. Scapes two or three, as long again as the leaves, with two yellow flowers. Found by Commeron at the Straits of Magellan. 8. C. f. n. Willd. Smith in Ind. 1. t. 1. C. uniflora, La Mark. Pl. 15. t. 3. "Scapes one-flowered; leaves egg-shaped, very entire." Smith. Leaves all radical, scarcely an inch long, smooth, narrowed into a petiole at their base. Scapes as long again as the leaves. Flowers large, yellow, spotted with red; upper lip very short, vaulted; lower lip elongated, pedunculous, and swelling; edge membranous, folded back, angular. Found at the Straits of Magellan by Commeron. 9. C. Fothergillii, Willd. Acton. R. 1. t. 1. La Mark. Pl. 15. t. 1. copied from Hortus Kewensis. "Leaves petiolaris, very entire; peduncles in the form of scapes, one flowered." Biennial. Stems scarcely an inch high, subdivided near the root. Leaves scarcely an inch long, opposite, many-nerved, obtuse, hairy above, narrowed into petioles. Peduncles solitary or in pairs, twice the length of the leaves. Division of the calyx acute, bent in at the end, hairy without. Upper lip of the corolla yellow, crested, vaulted, a little shorter than the calyx; lower lip descending, four times as long as the upper, dilated in front, inflated, pale yellow underneath, above red at the sides, in front yellow with red spots, near the palate yellow; aperture large, open; filaments inserted into the sides of the corolla at the base of the aperture; stamens roundish, large; style thick, the length of the stamens; stigma thickened, flat. A native of Falkland islands, introduced by Dr. Fothergill in 1772.

Propagation and Culture.—The first and the last are the only ones hitherto cultivated in England. The first may

be easily raised from seeds found on a gentle hot-bed in the spring; the seedlings, when of a proper size, may be transplanted into the borders of the flower garden, where they will flower, ripe, and scatter their seeds; but when a delicate plant, it appears to most advantage in a thin-floe, in which, as it will grow from cuttings, it may be had in flower all the year, by planting them in succession. Curtis.

Calceolaria (L. Flem.). See Viola Calceolaria, and Opposita.

Calceolus, a genus formed by Tournefort corresponding with cypripedium of Linnaeus. Tournefort's name is that of nearly all the old authors.

Calceolus Lappamum (Sect. Lap.). See Aconitum Lappamum.

Calceolus Philippiensis (Petiv.). See Cormionia Philippiensis.

Calchas, in Fabulous History, a famous diviner, who followed the Greek army to Troy. He is said to have predicted, that the siege of Troy would last ten years, and that the fleet, which was detained in the port of Aulis by contrary winds, would not set sail till Agamemnon's daughter had been sacrificed to Diana. After the capture of Troy, he is said to have retired to Colophon, and to have died there with grief, because he could not divine what another man of his own profession, called Mephisto, discovered; thus fulfilling a prediction mentioned by Sophocles. According to which, Calchas was to die as soon as he should meet with his master in the art of divining. If Suidas is to be credited, one of the Sibyls was Calchas's daughter; her name was Lampas; she called him the Colophonian; and afflicted to her the oracles in verse. Gen. Dict.

Calchophonium lapit. Among the ancients, a name given to a stone of a black colour and considerable hardness, which, when cut into thin plates, and struck against any other hard body, gave a sound like that of brails; it seems to have been one of the hard black marbles.

Calchiana, in Geography, a town of Naples, in the province of Bacilena; 16 miles E. of Arezzo.

Calchraga, in Botany, (Lobel.). See Cithara maximus.

Calchragus, stone-breaking, an appellation given by some to the Scopelidium; by others to pimplernel, on account of their lithotrity quality.

Calchurriphe, in Muralinley, a species of earth or stone, in which magnesia is mixed with a notable proportion of calcareous earth and fock iron. The colour is blue or olive-green, of the consistence of clay: the latter contains no argil, but merely calcareous earth and magnesia tinged with iron: the former contains a larger proportion of calcareous earth. Both are found near Thionville: the former is used by potters. Kirwan's El. Min. vol. i. p. 146.

Caliincara, in Geography, a town of Italy, in the duchy of Tuscany; 14 miles E. of Pisa.

Calcination, in general, a substance is said to be calcined when it has been exposed to heat of a sufficient intensity to drive off every volatile matter, but short of that requisite for its fusion. A calx, therefore, was underlaid by the ancient chemists, to be a pulverulent substance no longer combustible or capable of further alteration by fire than that of vitrification.

As most of the metals were found to be reducible to fusible by a form of a combination of a melting heat, the term calx of metals was long particularly appropriated to them, and is still partially retained, though it has been chiefly supplanted by the more characteristic appellation of oxyle, which expresses the peculiar change that occurs in calcining metallic bodies by the absorption of oxygen. Calcination, therefore, expec...
C A L

prefers the mode (or at least one mode), by which, in metals, this change is produced, and oxidation the circumstance of change. It is, however, obviously improper to confider the term calculation as synonymous with oxidation, even in speaking of metals, since the true original sense of the former term implies the agency of fire, whereas, oxidation may be produced as well by the action of acids, as by heat and air. Of the calexes, or calciated bodies, in which the change is totally independent of the abstraction of oxygen, calciated flints, calciated plaster of Paris, and calciated bariform, are common examples.

Calcination of gold and silver by electricity, was effected by Mr. Canton, who, by the heat of electrical explosions, produced numerous beautiful globules of transparent glass, and also others tinged with all the varieties of colour from those metals. He made it also probable that the black dust discharged from the brass chain, and other pieces of metal in such experiments, is the calx or glass of the metal reduced to smaller particles than the laws of optics require to produce colour. Hill of Elec. ed. 1775, vol. ii. p. 292. See Electrical Battery.

Calcinato, in Geography, a town of Italy, in the Bergamafo: seven miles S. E. of Bergamo.

Calcinato, a town of Italy, belonging to the state of Venice, in the Baffian, where the imperial troops were defeated by the duke of Vendome, in 1760: eight miles S. E. of Brescia. N. lat. 45° 25'. E. long. 9° 57'.

Calcinella, in Botany, the name given by Adanson to the Mattia papera of Poiret. See Pipperea.

Calcinelle of Adanson, the Sclavinian Venus Declarata.

Calcis, in Anatomy. See Os calcis.

Calcitrapa lattea. (Vail, act. 1719, p. 212.) See Centaurea, sicula, and calcitrapa.

The calcitrapoide form a section in the genus centaurea of Linnaeus, which consists of such species as have the spines of the calyx compound. Jussieu has formed a distinct genus for them, in which he has been followed by Gartner, Ventenat and Boise. The name is a hybrid production from the Latin calyx, the sole of the foot, and the Greek τειχος, which signifies to turn, and was suggested by the resemblance of the calyx, in these plants, to a machine used in war, consisting of sharp spikes, which turn on an axle when touched with the foot. It is called by the French chaine-trapez. See Centaurea.

Calcula, or Nalcua, in Ancient Geography, a town of the Atrebatii, in Ancient Britain, generally agreed to have been the same with the Colcum, in the Itinerary of Antonine, placed 22 miles from Venta Belgarum, or Winchester. Antiquaries are much divided about the precise situation of this place. See Atrebatii.

Calculare, in Antiquity, a sort of jugglers who practised flight of hand. Their art consisted in laying several calculi, or counters on the table, then covering them with cups, and shifting and changing them with dexterity, like what is practised by our jugglers.

Calculary of a pear, a congeries of little flory knots dispersed through the whole parenchyma of the fruit.

The calculus is no vital or essentia part of the fruit; the several knots whereof it consists being only so many concretions or precipitations out of the sap, as we see in urines, wines, and other liquors.

Calculation, the act of computing several sums, by adding, subtracting, multiplying, or dividing. See

Arithmetic. An error in calculation is never protected, or excused, by any sentence, decree, &c. In hiring accounts, there is always understood, fauro error calculi.

The word calculate is used in this sense, in allusion to the practice of the ancients, who used calculi, or little bones, in making computations, in taking syllables, and in keeping accounts. Arith. 1919; &c. as we now use counters, figures, &c.

A merchant or trader is said to have been mulcted in his calculation or accounts, when he has happened to take false measures, and has not succeeded in his undertakings as well as he expected.

Calculation is more particularly used to signify the computations in astronome and geometry, for making tables of logarithms, ephemerides, finding the times of eclipses, &c.

Calculation of clock and watch work. See Clock and Watch-work.

Calculation, in Music. D'Alembert, and many other theorists, and eminent mathematicians, are of opinion, that the calculation of ratios is of no use in practical music; supposing that a good ear and strong hand on instruments, where the tone depends on the performer, are a musician's bell guides for true intonation. In the preface to his Elem. de Mus, 2d edit. the great mathematician cautions theoretical musicians against the admission of mathematical or metaphysical principles in music. On this subject, he says: "It would be absurd to expect what is called demonstration: it is an achievement of no small importance, to have reduced the principal facts to a system consistent with itself and firmly connected with its parts; to have deduced them from one single experiment (the harmonics of a single string or found body), and to have established, on that foundation, the well common and essential rules of the art. In digressing and compounding M. Rameau's principles, I had no desire to multiply his calculations: I rather wished to simplify them as much as possible; so much was it to be feared that the generality of readers would be led into a belief, that all this arithmetic was necessary to form a practical musician. Calculation may, indeed, facilitate the intelligence of certain points in theory, such as the relation between the tones of the gamut and temperament; but the calculation necessary for treating these two points is so simple and trifling, that it merits no display. Let us not, therefore, imitate those musicians who believe themselves geometricalians, or those geometricalians who fancy themselves musicians, and, in their writings, heap figures on figures, imagining, perhaps, that this display is necessary to the art. The ambition of giving to their productions a scientific appearance, imposes only on the ignorant, and has no other effect than to render their treatises more obscure, and less instructive."

Calculator, a machine contrived and constructed by Mr. Ferguson, in the shape of an oratory, for exhibiting the motions of the earth and moon, and resolving a variety of astronomical problems. See an account of the construction, figure, and use of this machine, in Ferguson's Astronom., 4to. p. 283, &c.

Calculatores, in Antiquity, accountants who reckoned their sums by calculi. There were several servants under this denomination in great families. Children also at school were taught to practise the same. In the ancient canons we find a sort of diviners, or enchanters, confided under the denomination of calculatores.

Calculus, primarily denotes a little bone, pebble, or counter, anciently used in making computations, taking of suffrages, playing at tables, and the like. Hence the phrase ponere calculi, to denote a series of realess, and a multitude of others alluding to the use of these calculi in accounts.

Computation
Calculi were by the lawyers called calculuses, when they were either tides, or newly freed men; those of a better condition were denominated calculatores, or numerarii: ordinarily there was one of these masters in each family of distinction; the title of whose office was a calculus, or a mathematicus.

The Roman judges anciently gave their opinions by calculi, which were white for absolution, and black for condemnation. Hence calculus albatus, in ancient writers, denotes a favourable vote, either in behalf of a person to be absolved and acquitted of a charge, or elected to some dignity or post; as calculus niger did the contrary. This usage is said to have been borrowed from the Thracians, who marked their happy or prosperous days by white, and their unhappy by black pebbles, put each night into an urn. Hence also the phrases, signare, notula aliquid albo, nigrum lapillo seu calculo.

Besides the diversity of colour, there were some also which had figures or characters painted or engraved on them; as those which were in use in taking the suffrages both in the senate and at assemblies of the people. The letters marked upon these calculi were U. R. for ut regas, and A. for antiqua; the first of which expressed an approbation of the law, the latter a rejection of it. Afterwards the judges, who fat in capital causes used calculi marked with the letter A. for absolvus, C. for condemnus, and N. L. for non licet; signifying a more full information was required.

We may also mention another species of calculi used at the public games, whereby the rank and order in which the athletes were to fight were determined. If for instance they were twenty, then twenty of these pieces were cast into an urn; each ten were marked with numbers from one to ten, and the law was, that each of those who drew, should fight him who had drawn the same number. These were called calculi athletici.

Calculus is also used in Ancient Grammatic Writers for a kind of weight equal to two grains of cicer. Some make it equivalent to the libra, which is equal to three grains of barley. Two calculi made the cerasum.

Calculus also denotes a certain method of performing mathematical investigations and reformation. Thus, we say the antecedent calculus, the arithmetical or numeral calculus, the algebraical calculus, the calculus of derivations, the differential calculus, the exponential calculus, the fluxional calculus, the integral calculus, the literal or symbolical calculus, &c. See the following articles.

Calculus, Antecedental. This is a geometrical method of reasoning without any consideration of motion or velocity, applicable to every purpose, to which fluxions have been or can be applied. It was invented by James Glennie, eq. A. M. and fellow of the Royal Societies of London and Edinburgh, as early as 1774, but not published till the year 1793, when it was printed in London for G. G. I. and I. Robinsons, Paternoster-row. As he derived it from an examination of the antecedents of ratios, having given conceptions and a given standard of comparison in the various degrees of augmentation and diminution, which they undergo by composition and decomposition, he denominated it the Antecedental Calculus. It is certainly founded on principles admitted into the very first elements of geometry, and repeatedly made use of by Euclid himself. The inventor of this calculus does not in imitation of modern mathematicians talk of the powers of magnitudes and quantities, but considers every expression in it as truly and strictly geometrical, or rather as universally metrical in a geometrical form. For although the general formula in his universal comparison, from which it is derived in an easy, simple, direct, and convenient manner, are established on the same principles with those of Euclid's elements of geometry, and are deduced in a demonstrative way from an application of some of the truths contained in those elements to the doctrine of ratios or proportion, they are, strictly speaking, generally metrical, and extend not only to geometry, but also to algebra and arithmetic, when the standard of comparison is supposed to become one or arithmetical unity. The transitions from them in their geometrical forms to their algebraic and numerical ones, are as Mr. Glencij has observed, fo natural, fo scientific, and fo beautiful, that they cannot fail to furnish the mind with the highest pleasure and satisfaction, in pointing out, as it were, at one general view the connexion between these different sciences, and unfolding the reasons of their various operations, from the same indisputable and mathematical principles. He has not, like other mathematicians, in considering ratio confused himself to any particular modification of it; but he has regarded it as a magnitude peffalling all the measurable affections of any other magnitude, viz. addition, subtraction, multiplication, division, and ratio or proportion, or, as admitting, like other magnitudes, of augmentation or diminution, of increase or decrease. He is the first person, that we know of, who has roundly and expressively considered ratio or proportion as an affection of ratio, which it most unequivocally is. And by applying the elements of geometry to this consideration of it, he has extended the geometrical analysis indefinitely farther than any one before him, either among the ancients or moderns, as far as we are able to discover, has carried it. That he formed the design of applying geometry to ratios under this conception of them, as magnitudes sui generis, capable of all the possible degrees of increase and decrease, though they know no diversity of dimension in respect of kind, being homogeneous, and differing not in kind, but only in degree, and actually made such an application of it when he could not have been above eighteen or twenty years of age, is evident from his own performances. For in a short introduction to a paper read before the Royal Society of London, the 6th of March, 1777, and published in their transactions, which is entituled, "The general Mathematical Laws, that regulate and extend Proportion universally; or a Method of comparing Magnitudes of any kind together, in all the possible Degrees of Increase and Decrease," he makes use of the following words:

"The doctrine of proportion laid down by Euclid and the application of it given by him in his elements, form the basis of almost all the geometrical reasoning made use of by mathematicians both ancient and modern. But the reasoning of geometries with regard to proportional magnitudes have seldom been carried beyond the tricpate ratio, which is the proportion that similar folds have to one another, when referred to their homologous linear dimensions. This boundary however comprehends but a very limited proportion of universal comparison, and almost vanishes into nothing when referred to that endless variety of relations, which must necessarily take place between geometrical magnitudes in the infinite possible degrees of incrase and decrease. The first of these takes in but a very contracted field of geometrical comparison; whereas the last extends it indefinitely. Within the narrow compass of the first, the ancient geometers performed wonders; and their labours have been pulld still farther by the ingenuity and indefatigable industry of the moderns. But no author, that I have been able to meet with, gives the least hint or information with regard to any general method of expressing geometrically, when any two magnitudes of the same kind are given, what degree of augmentation or diminution
diminution any one of these magnitudes must undergo, in order to have to the other any multiplicate or submultiplicate ratio of these magnitudes in their given state; or any such ratio of them, as is denoted by fractions or surds; or to speak still more generally a ratio, which has to the ratio of the first-mentioned of these magnitudes, to the other the ratio of any two magnitudes whatever, of the fame but of any kind. Neither have I been able to find, that any other author has flown geometrically, in a general way, when any number of ratios are to be compounded or decompounded with a given ratio, how much either of the magnitudes in the given ratio is to be augmented or diminished, in order to have to the other a ratio, which is equal to the given ratio, compounded or decompounded with the other ratios. To investigate all these geometrically, and to fix general laws in relation to them, is the object of this paper; and, as it treats of a subject as new as it is general, I flatter myself will not prove unacceptable to this learned society. It would be altogether superfluous for me to mention the great advantages that must necessarily accrue to mathematics in general, from an accurate investigation of this subject, since its influence extends more or less to every branch of abstract science, when any data can be affermated for reasoning from. I shall in a subsequent paper take an opportunity of showing, how from the theorems afterwards delivered in this, a method of reasoning with finite magnitudes geometrically may be derived without any consideration of motion or velocity, applicable to every purpose, to which fluxions have been applied. He then defines magnitude to be "that which admits of increase or decrease," and quantity to be "the degree of magnitude," observing, that "by magnitude he means, beside extension, every thing which admits of more or less, or what can be increased or diminished, such as ratios, velocities, powers, &c.

A short performance of his, printed in Latin, in 1775, entitled "Leges Metaphyseic, seu Principia Mathematica, quæ Omina fere ad Magnitudinum Rationes, Rationumque Relationes spectantia universaliter gubernant et indefinito proferunt," he gives the fame metaphysical definitions of magnitude and quantity, with a declaration of what he means by magnitude, viz.

"Magnitudo est id, quod angenti vel dimini potest."  

"Quantitas est gradus magistitudinis,"  

"Per magnitudinem, praeter extensionem, omnia, quæ angenti vel dimini potiffit, habet rationes, velocitates, vires, &c. intellige."  

And in his Universal Comparison itself he says, "When I speak of magnitude, I mean to be understood as taking it in its general, abstracted, unlimited, and metaphysical acceptation, viz. to be whatever admits of more or less, of increase or decrease; and by quantity I mean the degree of magnitude." And to prevent any misconception of his meaning or intention, in regard to his mode of expressing magnitudes geometrically, and connecting them together by means of the customary signs, he makes use of the following words: — "When I mention the sum of magnitudes, or speak of them as additive or subtractive, I only mean that they are to be taken with or from other magnitudes of the same kind. The signs plus and minus are only intended to denote such aggregates and differences, or to connect magnitudes together in these relations, and by no means to convey any numerical ideas in the following theorems or formula, or to imply in themselves any sort of mystery, or even meaning, independent of the magnitudes thus connected. By A. B, &c. I mean a fourth pro-

\[ A, B, C, D, E, F, \text{ et cetera.} \]
of MN to NO and NR to OP, the magnitude LN, which has to B the ratio compounded of the ratio of A to B, and the ratio of equality B to B is expressed by $B + A - B$. In like manner if HI, KY be parallel to VO and KY to NR, and KL be a fourth proportional to OP, QR, and LN, or to A, B, and B + A - B, it will be equal to \[
\frac{A - B}{B} + \frac{n - 1}{2} + \frac{n - 2}{2} \cdot \frac{A - B}{B} + \frac{C}{B^2} + &c \ldots to \pm \frac{C}{B^{n-1}} \]
has to B such a multiplicate ratio of B - C to B as is expressed by the number n.

That $B + \frac{nr}{q} \cdot \frac{A - B}{B} + \frac{nr - q}{2q} \cdot \frac{A - B}{B} + \frac{nr}{q} \cdot \frac{r - q}{2q} \cdot \frac{A - B}{B} + &c \ldots to \pm \frac{C}{B^{n-1}}$ has to B such a multiplicate ratio of $B + \frac{r}{q} \cdot \frac{A - B}{B} + \frac{r - q}{2q} \cdot \frac{A - B}{B} + &c \ldots to \pm \frac{C}{B^{n-1}}$ has to B as is expressed by the number n.

Again, if VK be a fourth proportional to OP, QR, and NK, or to B, A - B, and $B + \frac{2}{1} \cdot \frac{A - B}{B} + \frac{2}{1} \cdot \frac{2 - 1}{2}$, $\frac{A - B}{B}$, it will be equal to $A - B + 2 \cdot \frac{A - B}{B} + \frac{3}{1} \cdot \frac{A - B}{B}$, and VKN will of course be equal to $B + 3 \cdot \frac{A - B}{B} + \frac{3}{1} \cdot \frac{3 - 1}{2} \cdot \frac{A - B}{B}$, and $\frac{A - B}{B} + 2 \cdot \frac{A - B}{B}$, or to $B + \frac{3}{1} \cdot \frac{A - B}{B} + \frac{3}{1} \cdot \frac{3 - 1}{2} \cdot \frac{A - B}{B}$, and $\frac{A - B}{B} + \frac{3}{1} \cdot \frac{A - B}{B} + \frac{3}{1} \cdot \frac{3 - 1}{2} \cdot \frac{A - B}{B}$, wherefore the magnitude of the same kind with A and B, which has to B the triplicate ratio of A to B, or, which comes to the same thing, the ratio, that arises by compounding the triplicate ratio of A to B, with the ratio of equality $B$ to B, is geometrically expressed by $B + \frac{3}{1} \cdot \frac{A - B}{B} + \frac{3}{1} \cdot \frac{3 - 1}{2} \cdot \frac{A - B}{B}$, and universally by the same geometrical reason as is found that $B + \frac{n}{1} \cdot \frac{A - B}{B} + \frac{n - 1}{2} \cdot \frac{A - B}{B} + \frac{n - 2}{3} \cdot \frac{A - B}{B} + &c.$ to $\frac{A - B}{B}$ has to B such a multiplicate ratio of A to B, or of $B + A - B$ to B, as is expressed by the number n. And as $A - B$ may be equal to any magnitude C of the same kind with A and B, the expression $B + \frac{n}{1} \cdot C + \frac{n - 1}{2} \cdot C + \frac{n - 2}{3} \cdot C + &c \ldots to \pm \frac{C}{B^{n-1}}$ is a magnitude of the same kind with C and B, that has to B such a multiplicate ratio of B + C to B as is expressed by the number n.

The foregoing expressions are obtained geometrically and correctly when A is greater than B. But if A be less than B, and be represented by EM or FN, we have FM equal to $B - A$, and by proceeding in an exactly similar manner we get the geometrical expression $B = \frac{n}{1} \cdot \frac{B - A}{B} + \frac{n - 1}{2} \cdot \frac{B - A}{B} + &c \ldots to \pm \frac{B - A}{B}$, for the magnitude of the same kind with A and B, that has to B such a multiplicate ratio of A to B, or of

This then being premised, it can be generally, and at the same time very briefly proved, that $B + \frac{r}{q} \cdot \frac{A - B}{B} + \frac{r}{q} \cdot \frac{A - B}{B} + &c \ldots to \pm \frac{C}{B^{n-1}}$. 

\[B = \frac{n}{1} \cdot \frac{B - A}{B} + \frac{n - 1}{2} \cdot \frac{B - A}{B} + &c \ldots to \pm \frac{B - A}{B} \]
CALCULUS.

\[
\begin{align*}
\frac{-r \cdot A-B}{B} + \frac{q \cdot r-q \cdot r-z \cdot A-B}{q} + \&c. = \frac{m-1}{z} \cdot A-B^1 + \&c. & \quad \text{since} \quad \frac{r \cdot A-B^1}{B} + \&c. \quad \text{are then respectively less than} \quad \frac{m-1}{z} \cdot \frac{A-B^1}{B} + \&c. & \quad \text{since} \quad \frac{r \cdot A-B^1}{B} + \&c. \quad \text{are then respectively less than} \quad \frac{m-1}{z} \cdot \frac{A-B^1}{B} + \&c. \\
\end{align*}
\]

has to B such a ratio, as has to the ratio of B + A - B to B, or of A to B, the ratio of r to q, be the ratio of r to q what it may, by taking any multiples whatsoever of these ratios and the fame multiples of r and g. For the sake of perspicuity let these magnitudes, and their multiples, stand in the following manner:

<table>
<thead>
<tr>
<th>The magnitudes</th>
<th>Their multiples</th>
</tr>
</thead>
<tbody>
<tr>
<td>1st. ( r )</td>
<td>Of the 1st. ( nr )</td>
</tr>
<tr>
<td>2nd. ( q )</td>
<td>Of the 2nd. ( mq )</td>
</tr>
<tr>
<td>3d. ( r \cdot A-B ) + &amp;c. \quad B</td>
<td>3d. ( B = \frac{nr \cdot A-B}{2q} + &amp;c. \quad B )</td>
</tr>
<tr>
<td>( r \cdot A-B ) + &amp;c. : B</td>
<td>( \frac{nr \cdot A-B}{2q} \cdot A-B + &amp;c. : B )</td>
</tr>
<tr>
<td>&amp;c. : B is equal to, or becomes the ratio ( B + ) ( \frac{m}{1} \cdot A-B + \frac{m}{1} \cdot \frac{m-1}{2} \cdot A-B^1 + &amp;c. )</td>
<td></td>
</tr>
<tr>
<td>( \frac{A-B^1}{B} ) + &amp;c. : B is equal to, or becomes the ratio ( B + ) ( \frac{m}{1} \cdot A-B + \frac{m}{1} \cdot \frac{m-1}{2} \cdot A-B^1 + &amp;c. )</td>
<td></td>
</tr>
</tbody>
</table>

Now it is evident, that if \( nr \) be equal to \( mq \), by substituting \( mq \) for \( nr \), the ratio \( B + \frac{nr}{q} = \frac{A-B}{B} + \frac{nr}{q} \cdot \frac{A-B}{B} \) + \&c. : B is equal to, or becomes the ratio \( B + \) \( \frac{m}{1} \cdot A-B + \frac{m}{1} \cdot \frac{m-1}{2} \cdot A-B^1 + \&c. \) since \( \frac{nr}{q} \cdot \frac{A-B}{B} ^{1} + \&c. \) are then respectively greater than \( \frac{nr}{q} \cdot \frac{A-B}{B} ^{1} + \&c. \) or \( \frac{nr}{q} \cdot \frac{A-B}{B} ^{1} + \&c. \) and \( \frac{nr}{q} \cdot \frac{A-B}{B} ^{1} + \&c. \) is, of course, a greater ratio of greater inequality than the ratio \( B + \frac{m}{1} \cdot A-B + \frac{m}{1} \cdot \frac{m-1}{2} \cdot A-B^1 + \&c. \) + \&c. : B is. And it is no less evident that, if \( nr \) be less than \( mg \), the antecedent \( B + \frac{nr}{q} \cdot A-B + \frac{nr}{q} \cdot \frac{A-B}{B} ^{1} + \&c. \) is less than the antecedent \( B + \frac{m}{1} \cdot A-B + \frac{m}{1} \cdot \frac{A-B}{B} ^{1} + \&c. \) is.

Here then are four magnitudes, and any equimultiples being taken of the 1st and 3d, and also any equimultiples being taken of the 2d and 4th, it is proved that, if the multiple of the 1st be equal to the multiple of the 2d, the multiple of the 3d is also equal to the multiple of the 4th; if greater, greater; and if its, less. Wherefore \( (5, 6, 7, 8) \) the magnitudes themselves are proportional, or the ratio \( B + \frac{r}{q} \cdot A-B + \frac{r}{q} \cdot \frac{A-B}{B} ^{1} + \&c. : B \) is to the ratio \( B + \frac{r}{q} \cdot A-B + \frac{r}{q} \cdot \frac{A-B}{B} ^{1} + \&c. : B \) as \( r : q \) whatever be the ratio of \( r \) to \( q \).

Having thus fully explained the doctrine of proportion, on which this calculus is grounded, we will briefly illustrate Mr. Genie's derivation of it from the same, and then shew, with how much ease and facility both the differential and fluxionary calcui may be derived from the same source, and in a manner too altogether unexceptionable.

If for \( R \) and \( Q \) we substitute \( r \) and \( q \) in the 1st and 5th formulae, in the 3d theorem of his Universal Comparison, they become respectively \( A + \frac{r-q}{q} \cdot A-B + \frac{r-q}{q} \cdot \frac{A-B}{B} ^{1} + \&c. \) and \( B + \frac{r-q}{q} \cdot A-B + \frac{r-q}{q} \cdot \frac{A-B}{B} ^{1} + \&c. \) and the last of which is immediately derived from the first, by substituting for \( A \) in it, where it stands unconnected with \( B \) by the sign minus, \( B + A-B \), which is equal to \( A \), and is the very magnitude, which we have just proved to have to \( B \) a ratio, which has to the ratio of \( B + A-B \) of or \( B \) to \( A \) the ratio of \( r : q \), even when \( r \) has to \( q \) the ratio of any two homogeneous magnitudes whatever.

Mr. Genie, however, takes the 1st of these two formulae, and supposes \( A+N \) to be in the first place substituted in it every where for \( A \). By this substitution he gets \( A+N \cdot \frac{A-B}{B} ^{1} + \&c. \) for the magnitude, which has to \( B \) the duplicate ratio of \( A+N \) to \( B \), exceeding the magnitude \( A+A \cdot \frac{A-B}{B} ^{1} \), which has to \( B \) the duplicate ratio of \( A \) to \( B \), by \( \frac{2A+N+2}{B} \). In like manner he gets the example: $\frac{5A}{2}$.
cefs of the magnitude, which has to B the triplicate ratio of \( A + N \) to B above the magnitude, which has to B the triplicate ratio of \( A \) to B, equal to the geometrical expression
\[
\frac{3A^2N + 4A^3N^2}{B^3}.
\]
And he thus finds, in general, that the exces of the magnitude, which has to B such a ratio, as has to the ratio of \( A + N \) to B the ratio of \( r \) to \( q \), above the magnitude, which has to B such a ratio, as has to the ratio of \( A \) to B, the same ratio of \( r \) to \( q \) is geometrically expressed by
\[
\frac{r \cdot A^{\frac{r}{q}} \cdot N + r \cdot \frac{r^2 - q^2}{2q} \cdot A^\frac{r^2 - q^2}{q} \cdot N^2 + \frac{r^3 - q^3}{2q} \cdot A^\frac{r^3 - q^3}{q} \cdot N^3}{B^q}
\]
Precisely in the same manner he makes it appear, that the exces of the magnitude, which has to B such a ratio, as has to the ratio of \( A \) to B the ratio of \( r \) to \( q \), above the magnitude, which has to B such a ratio, as has to the ratio of \( A - N \) to B the ratio of \( r \) to \( q \) is geometrically expressed by
\[
\frac{r \cdot A^{\frac{r}{q}} \cdot N^2 - r \cdot \frac{r^2 - q^2}{2q} \cdot A^\frac{r^2 - q^2}{q} \cdot N^3 + \frac{r^3 - q^3}{2q} \cdot A^\frac{r^3 - q^3}{q} \cdot N^4}{B^q}
\]
But if \( A + N \) and \( A - N \) stand to A in relations nearer to that of equality than by any given or assigned magnitudes of the same kind, each of these general expressions becomes
\[
\frac{r \cdot A^{\frac{r}{q}} \cdot N}{B^q}.
\]
Thus he calls the antecedent of the magnitude, which has to B such a ratio, as has to the ratio of \( A \) to B the ratio of \( r \) to \( q \).

Now if \( N = 0 \), the antecedent of \( A \) be denoted by \( \dot{A} \) or \( \ddot{A} \) (for the notation does not at all alter the case) the antecedental
\[
\frac{r \cdot A^{\frac{r}{q}} \cdot N}{B^q}
\]
becomes
\[
\frac{r \cdot A^{\frac{r}{q}}}{B^q}.
\]
or
\[
\frac{r \cdot A^{\frac{r}{q}}}{B^q} = \dot{A} \text{ and has to } \dot{A} \text{ or } \ddot{A} \text{ the ratio of } \frac{r}{q}.
\]
If \( q = 1 \) and \( r = 2 \), \( 3 \), \( 4 \), &c. it gives
\[
\frac{2A^{\frac{3}{2}}}{B}, \frac{3A^{\frac{3}{2}}}{B}, \frac{5A^{\frac{3}{2}}}{B}, \text{ &c. respectively. If } \frac{r}{q} = 2, \text{ &c. then gives } \frac{A^{\frac{3}{2}}}{2B^{\frac{3}{2}}}, \frac{A^{\frac{3}{2}}}{3B^{\frac{3}{2}}}, \frac{A^{\frac{3}{2}}}{4B^{\frac{3}{2}}}, \text{ &c. respectively. And if } q = 1 \text{ and } r = \sqrt{\frac{5}{3}}, \sqrt{\frac{7}{4}}, \sqrt{\frac{13}{5}}, \text{ &c. it gives } \frac{A^{\frac{3}{2}}}{2B^{\frac{3}{2}}}, \frac{A^{\frac{3}{2}}}{3B^{\frac{3}{2}}}, \frac{A^{\frac{3}{2}}}{4B^{\frac{3}{2}}}, \text{ &c. respectively, and so on.}
\]
Mr. Glennie then makes use of the last of these two formulæ, which is the 5th of theorem 3d, to come at the same conclusions. By it, when \( A \) stands to B in a relation nearer to that of equality than by any given or assigned magnitude of the same kind, the exces of the magnitude, which has to B such a ratio as has to the ratio of \( A \) to B the ratio of \( r \) to \( q \), above B is generally expressed by
\[
\frac{r \cdot A^{\frac{r}{q}}}{B^q} \text{ or by } \frac{\dot{A}}{\ddot{A}} \text{ or by } \frac{\dot{A}}{\ddot{A}} \text{ since in this relation of } (A \text{ to } B),
\]
\( A - B \) may be denoted by \( \dot{A} \) or \( \ddot{A} \); which expression is always as the measure or quantity of the ratio, that the said formula has to B, whatever be the relation of \( A \) to B. For in the simple, duplicate, triplicate ratios, &c. it gives \( \dot{A}, 2A, 3A, \text{ &c. and in the subduplicate, subtriplicate ratios, &c.}
\( \lambda, \lambda, \lambda, \text{ &c. or } \lambda \lambda, \lambda, \text{ &c. But if the ratio of } \frac{r}{q} \text{ to } \dot{A} \text{ to } \ddot{A}, \text{ which denotes the relation between the quantities of the ratios, that the magnitude expressed by this formula and } \dot{A} \text{ have respectively to } B, \text{ be compounded with the ratio of these magnitudes themselves, when } A \text{ has to } B \text{ any ratio whatever, or with that of}
\]
\[
\frac{\dot{A}^r}{B^q} \text{ to } A \text{ we get the ratio } \frac{\dot{A}^r}{B^q} \text{ to } A \cdot \dot{A}, \text{ which}
\]
is equal to the ratio of
\[
\frac{\dot{A}^r}{B^q} \text{ to } B \text{ the ratio of the antecedental of } \frac{\dot{A}^r}{B^q} \text{ and } \dot{A} \text{ as found above.}
\]
It is certainly worthy of remark, that the antecedental of any such magnitude as \( \frac{\dot{A}^r}{B^q} \) is a fourth proportional to B the standard of comparison, the magnitude itself, and the antecedental of the magnitude of the ratio, which it has to the standard B. Thus a fourth proportional to B, A, and A is \( \dot{A} \) or \( \ddot{A} \) the antecedental of A; a fourth proportional
proportional to $B$, $\frac{A}{B}$, and $\frac{2B}{A} \cdot \frac{A}{B} = \frac{2A}{A}$; and a fourth
proportional to $B$, $\frac{A}{B}$, and $\frac{r}{q} \cdot \frac{B}{A} \cdot \frac{a}{A} = \frac{r}{q} \cdot \frac{a}{A}$.

By means of the first formula in theorem 1 of his Universal Comparison, which expresses the magnitude, that has to $B$ such a ratio, as arises by compounding any number of ratios $C$ to $D$, $E$ to $F$, &c. with the ratio of $A$ to $B$, he determines the antecedental of $\frac{A \cdot C}{D}$ to be $\frac{B \cdot A}{C \cdot D}$ or $\frac{A \cdot C + C \cdot A}{D}$, and that of $\frac{A \cdot C \cdot E}{D \cdot F}$ to be $\frac{B \cdot A \cdot C \cdot E}{D \cdot F}$ or $\frac{A \cdot C \cdot E + A \cdot E \cdot C + C \cdot E \cdot A}{D \cdot F}$, and so on, supposing the consequents $D$, $F$, &c. of the ratios to be irremovable. And it is observable, that the antecedental of $\frac{A \cdot C}{D}$ is equal to a fourth proportional to $B$, the magnitude $\frac{A}{D}$ itself, and the antecedental of the magnitude of the ratio of $A$ to $B$, together with a fourth proportional to $D$, the magnitude $\frac{A \cdot C}{D}$ and the antecedental of the magnitude of the ratio of $C$ to $D$; that the antecedental of $\frac{A \cdot C}{D}$ is equal to a fourth proportional to $B$, $\frac{A \cdot C \cdot E}{D \cdot F}$ and the antecedental of the magnitude of the ratio of $A$ to $B$, together with a fourth proportional to $D$, $\frac{A \cdot C \cdot E}{D \cdot F}$, and the antecedental of the magnitude of the ratio of $C$ to $D$, together with a fourth proportional to $F$, $\frac{A \cdot C \cdot E}{D \cdot F}$, and the antecedental of the magnitude of the ratio of $E$ to $F$; and so on.

He makes use of the first formula in Theorem 2, Universal Comparison, which expresses the magnitude, that has to $B$ such a ratio, as arises by compounding any number of ratios $C$ to $D$, $E$ to $F$, &c. with the ratio of $A$ to $B$ to determine the antecedental of $\frac{A \cdot D}{B}$, $\frac{A \cdot D}{C}$, and so on for any number of ratios.

And here it is also observable, that the antecedental of

$$\frac{A}{C} \cdot \frac{D}{C} = \frac{C}{C} \cdot \frac{C}{C}$$

is equal to the

$$\frac{A}{C} \cdot \frac{D}{C}$$

And it is easily shown, from the principles he has laid down, that the antecedental of $\frac{A}{B}$ is $\frac{A}{B} \times \frac{B}{A}$ or $\frac{A \cdot B}{B} \times \frac{B}{A}$.

For, if $M$ denote the magnitude of the ratio $A$ to $B$ to the standard of comparison $B$, $\frac{M}{B} = \frac{B}{M}$ will be the magnitude of the ratio of $A$ to $B$. But $\frac{A}{B}$, $\frac{A}{B}$ : $\frac{A}{B}$, and $\frac{A}{B}$, the antecedental of $\frac{A}{B}$ to $B$. Wherefore the antecedental of $\frac{A}{B}$ is $\frac{A}{B} \times \frac{B}{A}$ or $\frac{A}{B} \times \frac{B}{A}$.

The antecedents and their antecedentals will therefore stand thus, $B$ being the standard of comparison.

**Antecedent.**

| A | - | $A$ or $A$ |
| A_B | - | $\frac{2A}{B}$ or $\frac{2A}{B}$ or $\frac{2A}{B}$ or $\frac{2A}{B}$ (putting $N$ for $A \cdot B$), or, &c. |
| A or A | - | $\frac{3A}{B}$ or $\frac{3A}{B}$ or $\frac{3A}{B}$ or $\frac{3A}{B}$ |
| A or A | - | $\frac{6A}{B}$ or $\frac{6A}{B}$ or $\frac{6A}{B}$ or $\frac{6A}{B}$ |

And in general $\frac{r}{B}$

| r | A | \frac{r}{B} |
| q | A | \frac{q}{B} |
| r \ or r | A | \frac{r}{B} | q \ or q |
| \frac{r}{q} | A | \frac{r}{q} | \frac{q}{q} |
| \frac{r}{q} | A | \frac{r}{q} | \frac{q}{q} |

Antecedent.
CALCULUS.

Antecedent. Antecedent.
AC - AC + CA \frac{a}{D} or \&c., \&c.
AC - AC + CA, or \&c.
ACE - ACE + AEC + CEA \frac{a}{DF} or \&c., \&c.
ACE - ACE + AEC + CEA, or \&c.,
And so on.

And when B the standard or comparison, becomes \( \frac{r}{q} \), or arithmetical unity, and when \( A + N \) and \( A - N \) are to \( A \) in relations nearer to that of equality than by any given or assigned magnitude of the same kind, they become

\( \frac{r}{q} \), or \( A \) to \( N \). Now if we denote the differential of \( A \) by \( dA \), and subtilute this for \( N \) we get

\( \frac{r}{q} \), \( A \) to \( dA \) for the differential of \( A^q \), and if we call \( \dot{A} \)

the fluxion of \( A \) and subtilute it for \( N \) we get \( \frac{r}{q} \), \( \dot{A} \)

\( \dot{A} \) for the fluxion of \( A^q \). And it is evident that \( \frac{r}{q} \).

\( r \cdot \frac{dA}{A} \) is a fourth proportional to \( \frac{r}{q} \) (the arithmetical standard of comparison, to \( \frac{r}{q} \) the expressions both in the fluxionary and differential calculi have a reference),

\( \frac{r}{q} \), and \( \frac{r}{q} \) the differential of the magnitude of the

\( \frac{r}{q} \) ratio \( A^q : 1 \) to the said standard \( r \); and that \( \frac{r}{q} \), \( \dot{A} \)

\( \dot{A} \) is a fourth proportional to \( \dot{A}^q \), and \( \frac{r}{q} \), \( \dot{A} \) the fluxion

of the magnitude of the ratio \( A^q \) : 1 to the same standard \( r \).

If, therefore, we make use of \( x, y, z, \&c. \) instead of the variable magnitudes \( A, C, E, \&c. \) in the antecedent calculus as delivered by its inventor, the integrals and their differentials will stand as follows:

Integral. Differential.

\( x \) \( dx \)
\( x^2 \) \( 2xdx \)
\( x^3 \) \( 3x^2dx \)
\( x^4 \) \( r \cdot \frac{r}{q} \cdot \frac{r}{q} \cdot dx \)
\( x^q \) \( r \cdot \frac{r}{q} \cdot x \cdot 2dx \)
\( xy \) \( xdy + ydx \)
\( xy \) \( xdy + ydx \)
\( \frac{y}{b} \) \( b \)
\( yz \) \( xydz + xzd\dot{y} + yzd\dot{x} \)
\( y^2 \) \( \frac{y^2}{b} \)
\( d^2 + y \) \( dx + dy \)
\( d^2 \) \( x^2 \cdot \frac{2dr}{r+dr} \) putting \( m \) for the magnitude of the ratio of \( x \) to \( 1 \).

\&c. \&c. \&c. \&c. \&c. \&c.

And the fluents and their fluxions will stand in the following manner.

Fluent. Fluxion.

\( x \) \( x \)
\( x^2 \) \( 2x \)
\( x^3 \) \( 3x^2 \)
\( x^q \) \( r \cdot \frac{r}{q} \cdot x \)

Fluent.
of derivations, in general, consists in reversing the law that connects together the parcels of any quantities whatever; and in making use of this law as a method of calculation for passing from derivative to derivative."

In order to form the algorithm of derivations, the author has introduced new signs. Accordingly, as Leibnitz has appropriated the symbol $d$ to denote the operation for obtaining the differential of a quantity, M. Arbogast employs the symbol $D$ in the process of obtaining the derivative of a quantity; thus, $D (x^n) = m x^{n-1}$, $D (a^x) = a^x$; and the development of a function, $F (x + \alpha)$, is therefore thus expressed:

$$
F_x + \frac{dF}{dx} x + \frac{d^2F}{dx^2} x^2 + \&c.
$$

which, according to the notation in the differential calculus, is

$$
F_x + \frac{dF}{dx} x + \frac{d^2F}{dx^2} x^2 + \&c.
$$

To avoid writing the factors, $1, 2, 3, \&c.$ in the denominators, let $D \alpha$ generally represent $\frac{1}{1.2.3.-\alpha}$; then,

$$
F (x + \alpha) = F_x + D F_x + x + D^2 F_x + x^2 + D^3 F_x + x^3 + \&c.
$$

This is the known form for the development of the function of a binomial; and the object of the primary articles of the present treatise is to find a form for the development of the function of a polynomial; viz. $x + x^2 + x^3 + \&c.$ The method of obtaining it may be thus briefly explained:—When $x$ is variable, and $D x = \beta$, write $D^\beta x$ for the derivative: when $x$ is variable, and $D x = 1$, write $D^1 x$ for the derivative; therefore,

$$
\begin{align*}
\frac{dF}{dx} (x + \beta) &= \frac{dF}{dx} (x + D. F_x + D^2 x + F_x + x^2 + \&c.), \\
\frac{d^2F}{dx^2} (x + \beta) &= \frac{d^2F}{dx^2} (x + D^2 F_x + D F_x + D x + F x + x^2 + \&c.),
\end{align*}
$$

put $F_x = a$, $F_x = D_a$, &c., and $\phi (a + D x + D^2 x + \&c.) = \phi_a + D \phi_a x + D^2 \phi_a x^2 + \&c.$

Now, to determine $D \phi_a$, $D^2 \phi_a$, &c., we have

$$
D \phi_a = D D \phi_a, D_a
$$

for $D^1 \phi_a = D (D \phi_a, D_a) = D D \phi_a, D^2 a
$$

and after development put $D x = \beta$, $D^2 x = \gamma$, $D^3 x = \delta$, &c.; hence it appears that $\phi (x + \beta x + \gamma x^2 + \&c.)$ may be converted into a series of the form $A x + B x^2 + C x^3 + D x^4 + \&c.$; and the first term $A = \phi_a$.

The coefficient of the second term will be $D^2 \phi_a$, or $D A$.

The coefficient of the third term will be $D^3 \phi_a$, or $D A$.

The coefficient of the $n + 1$ will be $D^2 \phi_a x^n$, or $D_A$.

provided that, after the derivations have been made, we put in the results $\beta$ for $D x$, $\gamma$ for $D^2 A$; and

$$
\begin{align*}
\text{The coefficient of $x^n$ or $A^n$ in the series $A + B x + \&c.$} &= D^n \phi_a x^n, \\
&= D^n \phi_a, D^{n-1} \beta + D^{n-1} \phi_a, D^n \beta + \&c., \\
&= D^n \phi_a x^n, \beta^n
\end{align*}
$$

The method of proof is this:

put $x = \beta + y x + \&c.$

then $\phi (x + \beta x + y x^2 + \&c.) = \phi (x + y x)$

$\phi x + D \phi x, y x + D^2 \phi x, y x^2 + \&c.$

but $\phi, \phi x, \phi x^2, \&c.$ are functions of the polynomial,

$\alpha + \beta x + y x^2 + \&c.$.

... generally $\phi x = D \phi x + D^n \beta x + D^2 \beta x + \&c.$

and $\phi x, \phi x^2, \&c.$ Write, therefore, in series (1), for $\phi x, \phi x^2, \&c.$, the values resulting from (2) collect the terms affected with the same power of $x$; and it will easily appear that the coefficient of $x^n$ or $A^n$ is such as we have stated it to be.

In this method is comprehended, as is evident, the form for the development of a polynomial raised to any power which
which was first given, but without satisfactory demonstration, by De Moivre, in the Translations of the Royal Society, and in his " Miscellanea Analytica," p. 57. The above form of M. Arbogast has many advantages; it exhibits comprehensively the law of the coefficients by means of the symbol D; and, when the operations indicated are to be actually performed, the coefficients easily result in terms of the polynomial quantities.

The formula for the function, being general, manifestly serves for the development of expressions, such as \( ax + bx + cx^2 + \cdots, \&c. \), \( (x + \beta x + \gamma x^2 + \cdots, \&c. ) \).

After having exhibited the general form for \( (ax + bx + cx^2 + \cdots, \&c. ) \), M. Arbogast shows how from one term to deduce the next succeeding, and likewise how to calculate any term whatever of the development, independently of all the others. The length and intricacy of the calculations render it impossible for us to give details of these methods.

In the latter part of the first article, the author applies his method of derivation to afford the fun of the powers of the roots of an equation, in terms of the coefficients of the equation; and the formula which he deduces is remarkable for the simplicity of the law by which the coefficients are expressed. Vandermonde (Memoirs of the Academy, 1771, p. 273.), Euler (Comm. Pat. 15 vol.), La Grange (Memoirs of Berlin, 1768), and Waring (Meditations Algebraics, p. 1.), having given general formulae for the fun of the powers of the roots of an equation, M. Arbogast compares his own with the demonstration of these, and shews how they follow from it. Whoever will take the trouble of examining these several formulae will find them not only less simply expressed than that of the present author, but less evidently and less rigorously demonstrated.

The author proceeds to the development of functions of two or more polynomials, arranged according to the powers of the same letter. Suppose the series \( a + bx + cx^2 + \cdots, \&c. \), and \( a + \beta x + \gamma x^2 + \cdots, \&c. \&c. \) are to be multiplied together; then the product is \( \left( ax + bx + \cdots \right) \left( ax + \beta x + \gamma x^2 + \cdots, \&c. \&c. \right) \), or making \( b = D. a, \beta = D. a, \gamma = D. a, \&c. \beta = D. a, \gamma = D. a, \&c. \gamma = D. a, \&c. \gamma = D. a, \&c. \), the coefficients of the terms affected with \( x, x^2, x^3, \&c. \) will be \( (a. D. a + D. a. a. a), (a. D. a + D. a. a. a), \&c. \), or \( (a. D. a, D. a, a. a, \&c. \), and the coefficient of the term affected with \( x^5 \) will be \( D. x^5 \), which may easily be developed.

Hence the formula for the product of any number of series, arranged according to the powers of \( x, \) may be determined.

In four series, for instance, of which the first terms are \( a, a', a'', a''' \), the origin of the derivations will be \( a', a'', a''' \); and the coefficient of the term affected with \( x^5 \) will be \( D. x^5 \), which, by foregoing methods, may easily be developed. Since \( a + \beta x + \gamma x^2 + \cdots, \&c. \) is the same as \( a + \beta x + \gamma x^2 + \cdots, \&c. \), and \( x^{n+1} \) the index of the term.

M. Arbogast determines the true and cofine of any multiple angle in cosines of the simple angle \( E \). His demonstrations for the forms expressing the sines, cosines, \&c. are clear and rigorous. He also directly discusses the difficult and complicated subject of double and triple recurring series. The next article of his treatise contains applications of the calculus of derivations to the general reversion of series; and this part of his work is executed with singular ability. His next object is the use of derivations in the differential calculus, which he considers as a particular case of the calculus of derivations. The 7th article of the author's work consists of three divisions: the first containing the application of the formule of derivation, to the development of the functions of polynomials, containing sines, cosines, \&c.; the second gives the application of the derivative calculus to the development of functions of polynomials, containing sines, cosines, \&c.; the third gives the application of the derivative calculus to the development of functions of polynomials, containing sines, cosines, \&c.
CALCULUS.

The product of factors in arithmetical progression; and the third follows the application of the separation of the scales of operations to the direct and inverse method of differences. For a further account of this subject, we must refer to the author’s elaborate treatise. See also an analysis of it in the Monthly Review (New Series), vol. xxxvi. p. 524-533.

Calculus differentials is a method of differencing quantities, or of finding an infinitesimal small quantity, which, being taken in finite times, shall be equal to a given quantity: or, it is the arithmetic of the infinitesimal differences of variable quantities.

The foundation of this calculus is an infinitesimal small quantity, or an infinitesimal, which is a portion of a quantity incomparable to that quantity, or that is less than any assignable one, and therefore accounted as nothing; the error accruing by omitting it being less than any assignable one. Hence two quantities, only differing by an infinitesimal, are reputed equal.

Thus, in Astronomy, the diameter of the earth is an infinitesimal, in respect of the distance of the fixed stars; and the same holds in abstract quantities. The term infinitesimal, therefore, is merely relative, and involves a relation to another quantity; and does not denote any real ens, or being.

Now infinitesimals are called differentials, or differential quantities, when they are considered as the differences of two quantities. Sir Isaac Newton calls them "moments;" considering them as the momentary increments of quantities; e.g., of a line generated by the flux of a point; or of a surface by the flux of a line. The differential calculus, therefore, and the doctrine of fluxions, are the same thing, under different names; the former given by M. Leibnitz, and the latter by Sir Isaac Newton: each of whom lay claim to the discovery.

There is, indeed, a difference in the manner of expressing the quantities resulting from the given views wherein the two authors consider the infinitesimals; the one as moments, the other as differences: Leibnitz, and most foreigners, express the differentials of quantities by the same letters as variable ones, only prefixing the letter d: thus the differential of x is called dx; and that of y, dy: now dx is a positive quantity, if x continually increases; negative, if it decreases.

The English, with Sir Isaac Newton, instead of d x, write dx (with a dot over it); for dy, &c., which foreigners and others object against, on account of that confusion of points, which they imagine arises, when differentials are again differentiated; on account of the ambiguity of the fluxional expressions, owing to the position of the index; because the fluxional expression cannot be so readily extended as the differential notation; and, besides, the printers are more apt to overlook a point than a letter.

Stable quantities are always expressed by the first letters of the alphabet d a = e, d b = e, &c.; wherefore d (x + y - a) = d x + d y, and d (x - y + a) = - d x - d y. So that the differencing of quantities is easily performed, by the addition or subtraction of their compounds.

To difference quantities that multiply each other, the rule is, first, multiply the differential of one factor into the other factor, the sum of the two factors is the differential product; thus, the quantities being xy, the differential will be x dy + y dx, i.e., d (xy) = x dy + y dx. Secondly, if there be three quantities mutually multiplying each other, the factor of the two must then be multiplied into the differential of the third: thus, suppose w x y, let x = t, then w x y = t t; consequently d (w x y) = t d y + y d t: but dt = d x + x d w. These values, therefore, being substituted in the antecedent differential, t dx + y dt, the result is, t (w x y) = w x d y + y x d x + x y d w. Hence it is easy to apprehend how to proceed, when the quantities are more than three.

If one variable quantity increases, while the other decreases, it is evident y dx - x dy will be the differential of xy.

To difference quantities that mutually divide each other, the rule is, first, multiply the differential of the divisor into the dividend; and, on the contrary, the differential of the dividend into the divisor; subtract the left product from the first, and divide the remainder by the square of the divisor; the quotient is the differential of the quantities mutually dividing each other. See Fluxions and Function, under which article will be cited La Grange’s method of divining the principles of the differential calculus of all reference to infinitely small or evanescent quantities.

M. La Croix in his "Treatise on the Differential and Integral Calculus," considers the differential calculus in precisely the same point of view in which M. La Grange regarded it in the Berlin Acta for 1772, and subsequently in an express and formal treatise on the subject. An ingenious anonymous writer has given the sublimity and spirit of M. La Croix’s reasoning, without adhering closely to his notation and method.

Let z = fx be any function of x; then, if for x we substitute x + h, the development of f(x + h) will be of this form:

\[ f(x+h) = f(x) + f'(x)h + \frac{f''(x)h^2}{2!} + \cdots \]

the coefficients f'(x), f''(x), &c. being derived from the primitive function f(x), and independent of h.

Hence \[ f(x+h) - f(x) = f'(x)h + \frac{f''(x)h^2}{2!} + \cdots \]

which quantity represents the difference between f(x) and what f(x) becomes when x is increased to x + h. Let the first term of this difference be called the differential, and be denoted by the expression df(x); hence we have \[ df(x) = f'(x)dx \cdot f'(x) = \frac{df(x)}{dx} \]

Hence to have f'(x), divide the difference between two successive values of f(x) by the increment: but, since f'(x) is independent of h, h must disappear by this division, and may be represented by any symbol at pleasure. Hence, for the sake of uniformity in the signs, let h be represented by \[ dx \cdot f'(x) = \frac{df(x)}{dx} \]

Hence to find df(x), or the differential of f(x), write in f(x), x + hdx, for x, and develop f(x + hdx) as far as the terms affected with the first power of dx, and subtract f(x).--

Since \[ f(x + hdx) - f(x + hdx) = f'(x)dx + \cdots \]

&c.

\[ f'(x)dx - f''(x)dx^2 \ldots \]

then \[ df(x) = \frac{df(x)}{dx} \cdot dx \]

But since dx is invariable,

\[ f'(x + hdx) = f'(x)dx^2 \ldots \]

\[ df(x) = f''(x)dx^2 \ldots \]

but \[ df(x)dx = \frac{df(x)}{dx} = dx \]

(both not meaning a symbol d squared, but denoting the second differential of f(x) to be taken): hence it appears, since \[ f''(x) = \frac{df(x)}{dx} \]

\[ d'(x) \]

\[ dx^2 \]
C A L C U L U S.

\[ \frac{df}{dx}, \text{ and thus the derived functions } f'x, f''x, f'''x, \text{ etc.} \]

may be represented by the quantities \( \frac{df}{dx}, \frac{d^2f}{dx^2}, \frac{d^3f}{dx^3}, \text{ etc.} \)

so that the development of \( f(x + b) \) takes this form, \( f_{x} + \frac{df}{dx} \cdot b + \frac{d^2f}{dx^2} \cdot \frac{b^2}{2!} + \text{ etc.} \)

the celebrated theorem of Taylor.

**Calculus, differential-differential.** is a method of differencing differential quantities. As the sign of a differential is the letter \( d \) prefixed to the quantity, so that \( dx \) is the differential of \( x \), that of a differential of \( dx \) is \( d^2x \), and the differential of \( d^2x \) is \( dd^2x \), etc.; similar to first, second, and third, etc. fluxions, \( x, x, x, \text{ etc.} \); thus we have degrees of differentials. The differential of an ordinary quantity is a differential of the first order or degree, \( dx \); that of the second degree is \( d^2x \). The rules for differentials are the same with those for fluxions. See Fluxions.

**Calculus exponentialis.** is a method of differentiating exponential quantities, or of finding and summing up the differentials or moments of exponential quantities; or at least bringing them to geometrical constructions.

By exponential quantities, is here understood a power, whose exponent is variable; v.g. \( e^{ax}, e^{ay}, e^{az}, \text{ etc.} \) where the exponent \( x \) does not denote the same in all the points of a curve, but in some for \( 2, \) in others for \( 3, \) in others for \( 4, \) etc.

To *difference an exponential quantity*: there is nothing required but to reduce the exponential quantities to logarithmic ones; which done, the differentiating is managed as in logarithmic quantities.—Thus, suppose the differential of the exponential quantity \( x^n \) required, let \( x^n = \eta \)

Then will \( f(xdx + \eta dx) = \frac{f(x)}{dx} + \frac{d^2f}{dx^2} \cdot \frac{\eta}{n} \)

etc.,

That is, \( \frac{\eta dx + \eta dx}{dx} = \frac{dx}{dx} \). Bernouilli Opera, tom. i. p. 183. See Exponential.

**Calculus fluxional.** See Fluxions.

**Calculus integralis, or summatorius.** is a method of integrating, or summing up moments, or differential quantities; i.e., from a differential quantity given, to find the quantity from whole differentiating the given differential results.

The integral calculus, therefore, is the inverse of the differential one: whence the English, who usually call the differential method, fluxions, give this calculus, which ascends from the fluxions, to the flowing or variable quantities: or, as foreigners express it, from the differences to the sums; by the name of the inverse method of fluxions.

Hence, the integration is known to be justly performed, if the quantity found, according to the rules of the differential calculus, being differentiated, produce that proposed to be summed.

Suppose \( \int \) the sign of the sum, or integral quantity; then \( \int ydx \) will denote the sum, or integral of the differential \( ydx \).

To *integrate, or sum up a differential quantity*. It is demonstrated, first, that \( \int xdx = \frac{x^2}{2} \); secondly, \( \int (x + dy) = x + y \); thirdly, \( \int (x^2 + dy^2) = x^2 + y \); fourthly, \( \int (x^2 + y^2) = x^2 + y^2 \).

If the differential quantity to be integrated, doth not come under any of these formulas, it must either be reduced to an integral finite, or an infinite series, each of whose terms may be summed.

It may be here observed, that, as in the analysis of finite quantities, any quantity may be raised to any degree of power; but *vice versa*, the root cannot be extracted out of any number required: so in the analysis of infinite quantities, any variable or flowing quantity may be differenced; but *vice versa*, any differential cannot be integrated. And as, in the analysis of finite quantities, we are not yet arrived at a method of extracting the roots of all equations; so neither has the integral calculus arrived at its perfection; and as in the former we are obliged to have recourse to approximation; so in the latter we have recourse to infinite series, where we cannot attain to a perfect integration.

The first traces of the integral calculus are to be found in the *Epitome de Curvarum.* In his "Principia," he concealed his analysis, and adhered to the manner of the ancients. It does not appear by what method he solved the 34th proposition of the 2d book of the "Principia" concerning the solid of least resistance, whether he effected it by a particular arithmetic, or whether he really possest the calculus of variations, of which Leibnitz and the Bernoullis are now the inventors. The mathematicians to whom the integral calculus is chiefly indebted for its improvement, are John Bernoulli, who integrated rational fractions; James Bernoulli, who integrated the fluxional equation, \( y = x^2 \); Cotes, who published in 1714, "Theoremata de Logometriae quae Trigonometriae," Riccati, who integrated the fluxional equation \( y' + \frac{y''}{x'} = 0 \); Maclaurin, author of a treatise in 2 volumes, 4tos.; Simpson, Fontaine, Clairaut, D'Alembert, and Euler, whose researches on the integral calculus occur in the volumes of the academies of Paris, Berlin, Turin, and Peterburgh. The last author published in 1768 his "Institutiones Calculi Integralis," highly enriched with original inventions; and in the same year, Le Saur and Jacquier published a work in 2 volumes, 4tos., which superseded a work of M. Bouguinville, published in 1754, intended as a supplement to the "Analyse des Infiniment Petits de Marquis de L'Hopital." Condorcet, La Grange, La Place, Monge, and Le Gendre, have also made considerable additions to the integral calculus. M. La Croix has likewise published a comprehensive and valuable treatise on the differential and integral calculus (Traité du Calcul Differentiel, &c. 2 vols., 4tos., Paris). In the plan of this work it is proposed to comprehend and systematize all that has been written on the differential and integral calculus. It commences with a history of the subject which properly originates with the times of Euclid and Archimedes; because the methods of ex-
C A L C U L U S.

hunions and limits rest on the same foundation. The questions that led to its discovery have been discussed since the earliest era of geometry. The 12th proposition of the 12th book of Euclid's Elements is a problem of this kind, and the first that has come down to us. Archimedes, by similar methods, advanced to the solution of more difficult problems, than that which investigated the relation of circles to one another; such as the relations between the surfaces and solid contents of the cylinder and sphere, the quadrature of the parabola, and the proportion of spirals. M. La Croix then proceeds in his history of the differential calculus, as connected with the several discoveries made by Cavalieri, Roberval, Desartes, Fermat, Hugens, Gregory de St. Vincent, Pafcal, Wallis, Barrow, Leibnitz, and Newton. See Fluxions.

M. la Croix's treatise consists of two parts: the first part gives an account of the differential calculus; and the subject of the second part is the integral calculus. This part begins with the integration of functions of one variable quantity; and the author has furnished various formulze for integrating rational and irrational functions, logarithmic and exponential functions, circular functions, &c. and he then applies the integral calculus to the quadrature and rectification of curves, to the quadrature of curved surfaces, and to the content of the solids comprehended by them. He subjoins an exposition of the methods which Euler employed in his researches concerning curves that are quadrate, rectifiable, &c. His next object is the integration of differential equations of two variable quantities; and in reference to this he has collected all that has been written on this intricate subject. Accordingly this chapter of his work contains methods for separating the variable quantities in differential equations of the first order; for investigating a factor proper to render a differential equation of the first order integrable; for integrating differential equations of the first order, in which the differential quantities pass the first degree; for obtaining particular solutions of differential equations of the first order; for resolving by approximation, differential equations of the first order; for constructing, geometrically, differential equations of the first order; for integrating differential equations of the second order by means of transformations; for investigating a factor proper to render differential equations of the second order integrable; for resolving, by approximation, differential equations of the second order; and for integrating differential equations of orders superior to the second. The subject of the next chapter is the integration of fractions containing two, or a greater number of variable quantities. The fifth and last chapter treats of the method of variations.

The calculus of variations originated from certain problems concerning the maxima and minima of quantities having been proposed by John Bernouilli, to the mathematicians of Europe. Such a problem was that in which it was required to find, of all curves passing through two fixed points, and situated in the same vertical plane, that one down which a body would descend from the highest to the lowest point in the least time possible. The first geometers, remarking that nothing was obtained by putting the differential of the time, \( \frac{dx}{t} = a \), found that they could obtain a solution by making the time a minimum for two successive elements of the curve; thus, if \( x, x', x'\prime \) were three vertical abscissas, and \( y, y', y'\prime \) the corresponding ordinates, the time would be expressed by

\[
\sqrt{\frac{(x'-x) + (y'-y)}{x}} + \sqrt{\frac{(x''-x') + (y''-y')}{x'}} = b \text{ a constant.}
\]

The result of this equation, \( y = \frac{dy}{dx} \), gives a quantity; and consequently proved the curve to be a cycloid. — Euler, with far greater analytical knowledge than John Bernouilli, next treated these problems in a general manner, in his tract intitled, "Methodus inveniendi linearis curvas maximi minime proprietate gratae; sive problematis isoperimetris latiimo senftu accepti." M. La Grange afterward gave greater generality to this calculus, by making variable not only \( y, \frac{dy}{dx}, \frac{dy'}{dx}', \&c. \) but \( x \).

The explanation of M. La Croix affords a clear idea of the calculus of variations:

"Suppose (says he) the variable quantities at first conceived together by an equation, or by any other dependence, to change by reason of the form of the equation, or of the relation that results from the dependence established between them; ceasing to be the same; this circumstance cannot be expressed in a more general manner, than by regarding the increments of \( x \) and \( y \), as absolutely independent of each other; hence, in effect, this hypothesis, not designating any particular relation between \( x \) and \( y \), comprehends all. It follows thence, that the calculus of variations can only be employed for expressions, to which the differential calculus has already been applied; and it differs from the last only by the independence which it supposes between the variable quantities, which before were considered as connected by constant relations. The following example will illustrate this notion. The expression \( \frac{dy}{dx} \) which belongs to the subtangent of a curve, represents a determine function of \( x \), when \( y \) is considered as a function whose composition in terms of \( x \) is known; and if this last changes, the first changes also. There will be, perhaps, some difficulty in conceiving how we can submit to calculation the variability of a function which is only the abstract dependence in which several quantities are with regard to each other; but this difficulty is removed, by considering that the connection between the quantities \( y \) and \( x \) changes, if the first be made to vary independently of the second. Thus, in the example before us, if we suppose \( x \) to remain the same, and \( y \) and \( \frac{dy}{dx} \) to change, the relation between \( x \) and \( y \) must necessarily have changed also; since these quantities are the immediate consequences of that relation: \( \frac{dy}{dx} \) in the form \( \frac{ydx}{dy} \), may alone be made to vary, since it depends only on one value of \( y \); but, if an expression affected by the sign \( \int \) be considered, \( y \) and \( \frac{dy}{dx} \) must be made to vary at the same time; for it follows from the theory for the formation of integrals, that the value of a like function depends on the consecutive values of \( y \) which are deduced from those of \( \frac{dy}{dx} \)."

"It is evident that, to take under this point of view the differential of any expression whatever, it is sufficient to make \( y, \frac{dy}{dx}, \frac{dy'}{dx}', \&c. \) vary without altering \( x \); but, in treating this latter quantity, as variable as the first, we arrive at results more general and symmetrical than what are otherwise obtained, and which lead to very interesting remarks on the nature of the differential forms. For these reasons, we shall adopt in this chapter the method of making \( x, dy, dy' \) vary. That the symbols of this new species of differentiation, in which \( x \) and \( y \) are considered as independent, may not be confounded with the symbols of the first,
CALCULUS.

In which one of the variable quantities is regarded as a function of the other, we shall employ, after the manner of La Grange, the characteristic \( \frac{dx}{dy} \); and we shall suppose, with him, that when \( x \) changes only by virtue of the change of \( y \) which becomes \( x + dx \), its differential is \( dy \); but then, when the relation of \( x \) and \( y \) varies, these two quantities become respectively \( x + dx \) and \( y + dy \); and we note by the name of variations, the increments \( dx \) and \( dy \).

Hence it follows that, as \( du = \frac{dx}{dy} \cdot du + \frac{dy}{dy} \cdot du \),

\[ \frac{du}{dx} = \frac{dy}{dx} + \frac{dy}{dy}. \]

In applying this to the example \( \frac{dy}{dx} \), we must regard \( dx \) as a function of \( x \) and \( y \); whence it results that

\[ \frac{dy}{dx} = \frac{dx}{dy} + \frac{dy}{dy} \left( \frac{dx}{dy} \right) \]

and \( \frac{dy}{dx} = \frac{dy}{dx} + \frac{dy}{dy} \).

M. La Croix then proves \( \frac{dy}{dx} = \frac{dy}{dx} \); and, after the methods for finding the variations of any function whatever, is given the application of the calculus to the problems of maxima and minima.

CALCULUS literalis, or literal Calculus, is the same with specious arithmetic, or algebra, as called, from its using the letters of the alphabet: in contradistinction to numeral arithmetic, which uses figures.

In the literal calculus, given quantities are expressed by the first letters, \( a, b, c, d, \) &c.; and quantities sought by the last \( x, y, z, \) &c. Equal quantities are denoted by the same letters. See Algebra.

CALCULUS, in Medicine, the disuse of the stone in the bladder or kidneys. The calculus in the bladder is called lithiasis; and in the kidneys, nephritis. See Stone.

CALCULUS, Biliary. Small, hard, roundish, concrements are often found in the gall bladder, or in the ducts leading from the liver and gall-bladder to the intestine, which occasion in their passage much acute pain to man, and probably other animals, and have attracted some attention from chemists.

Biliary calculi (or gall-stones, as they are also termed) vary both in external appearance, and in chemical properties. The colour is generally green or yellowish-brown, sometimes, though rarely, white; in shape they are mostly oblong, often tuberculated. When cut through, they most frequently consist of a radiated semi-crystalline mass, internally often resembling spermaceti, coated with several concentric laminae. The radiated part is mostly white and tallowish; the laminated is sometimes bitter.

Gall-stones are distinguished for their lightness and inflammability, few of them being so heavy as to sink in water; and when put to a lighted candle, most of them melt like wax, and burn with a very bright flame, and very little ammoniacal smell. From the infinite minute varieties in gall-stones, no natural arrangement is indicated, but the most important differences, known by chemical analysis, rest upon the proportion of the radiated, crystallized, central part, and the general lightness and inflammability.

The radiated gall-stones are largely soluble in oil of turpentine, and in all the essential oils by heat. Alcohol when cold has but little action, but when boiling it dissolves almost all the inflammable part of the calculus, leaving an earthy residue behind. On cooling, this solution deposits very copious peculiar crystals, strongly resembling those of spermaceti treated in this way, and this singular substanace forms by far the most curious part of these morbid concretions. Poulett and Fourcroy have both attended minutely to this matter. The former discovered similar crystalline concretions in a piece of liver long hung up in a dry air.

When the hot alcoholic solution of this concrete is dropped into a large quantity of water, a white flaccid precipitate is formed, which, when dried, is found to be of a refrinous nature. The supernatant liquor by saturation with muriatic acid and evaporation gives muriat of soda, by which it is evident that the soda of the bile remains in union with its resin during its conversion into biliary calculi; but the chemical nature of this conversion is very obscure.

Ether dissolves the spermaceti-like concrete as well as oil of turpentine, and deposits the greater part on cooling. Hot nitric acid is decomposed on it, and nitrous gas is given out, and when cool, a white oil is found concreted on the surface of the acid, now no longer of a crystalline texture, but altered in its properties, being brittle and friable like a resin, and when re-dissolved in alcohol it has lost its power of crystallizing by cooling. It is still, however, insoluble in water. Ether dissolves this altered concrete as it did when in its natural state, but water now separates it in the form of drops of oil. Saunders on the bile. Fourcroy. Bolestock in Phil. Journ. vol. vi.

CALCULUS Minurens, among the Ancient Lawyers, denoted the decision of a cause, wherein the judges were equally divided. The expression is taken from the history of Oedipus, represented by Eschylus and Euripides; at whose trial, before the Areopagities for the murder of his mother, the votes being equally divided for and against him, Minerva interposed, and gave the calling vote, or calculus, in his behalf.

M. Cramer, professor at Marburg, has a discourse express. "De Calculo Minurens," wherein he maintains, that all the effect an entire equality of voices can have, is to leave the cause in statu quo.

CALCULUS Tiburtinus, a sort of figured stone, formed in great plenty about the canals of the Aius, and other rivers in Italy; of a white colour, and in shape oblong, round, or ovoid. They are a species of the silex lepideus, and generated like them; and so like sugar-plums in the whole, that it is a common jest at Rome to deceive the inexperienced by serving them up at feasts.

CALCULUS, urinary. See Urinary calculus.

CALCUITA, in Geography, a city of Hindooistan, and capital of Bengal, and of all the British possessions in India, is situated on the river Hoogly, the western arm of the Ganges, at the distance of about 100 miles from the sea; and the river is navigable up to the town, for the largest ships that visit India. Its citadel is placed in N. lat. 25° 37'. E. long. 88° 27' 45". It is comparatively a modern city, having been built towards the close of the 17th century on the site of the village called Govindpour. The English factory obtained leave to remove hither from Hoogly in the year 1689 (see Bengal), when Mr. Chisholm was agent in Bengal, and who fixed upon this spot for the British emporium, though from several circumstances it was at that time the most unhealthy he could have chosen. For 3 miles to the north-east there was a salt-water lake, that overflowed in the months of September and October; and in the two following months, when these floods withdrew, prodigious quantities of fish were left dry, the purefication of which was supposed to affect the air; and this, together with the fetid putrid exhalations from the ooze and sludge, conveyed by the north-east wind to Fort William, occasioned a yearly mortality.
During the rapid increase of this town, diseases were fatal to thousands, and particularly, according to the testimony of Dr. Lind, among such as had lately arrived from Europe. Hamilton mentions an influence, from his own knowledge, of 400 burials in six months, at a period when all the English resident here did not exceed 1,200. Besides, when this spot was chosen, every man was allowed to build as bell suited his convenience and taste, without regard to the disposition of the whole; and, therefore, the different houses bore no resemblance to one another either in their position or architecture. From this small and unpromising beginning, Calcutta is now become a large, populous, and in many respects, an elegant city. The quarter inhabited by the English is composed entirely of brick buildings, many of which appear more like palaces than private houses; and though they add much to the beauty of the place, they would have a much b etter effect if the streets were laid out with greater symmetry and order: but the rest of the city, and, indeed, most of the part of it, consists of houses like those of the other Indian cities; all of which are constructed on the same plan, with very narrow, confined, and crooked streets, in which are interposed an incredible number of refectories and ponds, and a great many gardens. Some few streets are paved with brick. The houses are variously built; some with brick, others with mud, and a still greater proportion with bamboo and mats; and these different kinds of edifices, being intermixed with one another, form a motley appearance. Thos of the latter kind are invariably of one story, and covered with thatch. The brick houses generally exceed two stories, and have flat terraced roofs. The two former classes far outnumber the last, which are often so thickly studded, that fires, which frequently happen, do not sometimes meet with the obstruction of a single brick house through a whole street. The structure of the European houses serves to excite them from fire; as only a small portion of wood enters into the materials, for the partition-walls, as well as the flat roofs, are chiefly constructed of brick and mortar, which last article, under the denomination of "Chunnam," the natives have brought to great perfection. The buildings of the place extend full 5 miles along the river, and about half as much in breadth from it. Within the last 30 or 40 years, Calcutta is wonderfully improved, both in appearance and in the salubrity of its air; for by draining the streets and filling up the ponds, they have removed a vast surface of stagnant water, the exhibitions of which were particularly injurious. The local situation of Calcutta, as we have already observed, is not fortunate; for it has some extensive muddy lakes, and a salt forest close to it. More still remains to be done before Calcutta can merit the character of a healthy town. In the middle of the city a large open place has been left, in which there is a spacious tank or reservoir, covering upwards of 25 acres of ground. It was dug by order of the government, to provide the inhabitants of Calcutta with water; as in the dry season the water of the Ganges becomes brackish by the influx of the tide, while that in the tank is very sweet and pleasant. The number of springs which it contains preferves the water always nearly at the same level. It is railed round, nor is any person suffered to wash in it; but all are at liberty to take as much water from it as they like. Near this tank is a handsome obelisk, erected by Mr. Holwell, one of the few survivors in the tragic scene of the black hole, of which we shall subjoin an account; it is about 50 feet high, inscribed with the names of the persons who died on this execrable occasion, and whose bodies were promiscuously thrown, the next morning, into the ditch of the fort. A little farther is the court-house, over which are two handsome assembly-rooms. Close to the court-house is a theatre, where plays are sometimes performed. Beyond this is an Armenian church, which is a large and noble building, with a handsome steeple. There is a to an English church of modern construction. The citadel, called "Fort William," is situated about a quarter of an hour's walk from the city, by the side of the Ganges, in an extensive plain. This citadel is superior in every point, as it regards strength and correctness of design, to any fortresses in India; but it is formed on too extensive a scale to answer the useful purposes intended, that of holding a poft in case of extremity; since the number of troops required properly to garrison it, could keep the field. It was begun in the year 1757, immediately after the victory at Plassey, which restored to the British an unlimited influence in Bengal; and it was the intention of Clive to render it as permanent as possible, by providing for all times a tenable post. However, he had no foresight of the vast expense attending it, which may perhaps have been equal to two millions sterling. It is a regular pentagon, with several outworks. The ramparts are built of brick, halfway up, finished with clay, and faced with gaurons. Both the body of the fortresses and the outworks are surrounded by a wet ditch, which has a small concrete, 6 or 7 feet deep, in the middle. The water from the Ganges may be let into the moat, to the height of 8 feet, by means of flood-gates, of which there are two to each outwork, constructed in such a manner, that if an enemy be master of one, he cannot prevent both the main ditch, and those of the other outworks, from retaining their water. If all the works were mounted with cannon, there would be room for 600 pieces of artillery. Within the fort are bomb-proof barracks for 10,000 men. All the works are guarded by mines and countermines. No ship can pass up or down the Ganges without being exposed to the fire of this fort; nor can any enemy approach by land without being discerned at the distance of 3 or 4 leagues. The population of Calcutta is supposed to amount at present to more than half a million of inhabitants; and their different aspect and manners present a very picturesque and interesting scene. The black Hindoo, the olive-coloured Moor or Mahometan, contrast with the fair and Rord countenances of the English; and the charms of the European damsel receive a foil from the dark Hindoo beauties. "The mixture of European and Asiatic manners," says a traveller in India, "which may be observed in Calcutta, is curious: coaches, phaetons, single-horse chaises, with the palanquins and hackeries of the natives, the paifing ceremonies of the Hindoos, the different appearances of the Fakirs, form a £ight more novel and extraordinary than any city in the world can present to a stranger." "To the luxuries of the Asiatic (says Mr. Pinkerton) are added the elegance and science of the English life. Even the newspapers are drawn up with care, and printed with elegance;" and the Asiatic Society, instituted by the late admirable sir William Jones (in January 1784), may perhaps rival the Academy of Inscriptions at Paris, if the papers of the latter were adopted as a model. "The Asiatic Researches, which are the productions of this society, form a noble monument of British science in a distant country."

Calcutta is eminently distinguished as the emporium of Bengal, and the residence of the governor-general of India. It is also the seat of justice, under four judges, who dispense judgment according to the laws of England. Its flourishing state may be ascribed, partly, among other causes and circumstances that have contributed to it, to the unlimited toleration which it affords to all forms of religion; the Pagans being suffered to carry their idols in procession, the Mahometans not being discommoded, and the Roman Catholics being allowed a church.

The police of the city is chiefly committed to a superintendant;
tenant of police, and several inferior justices of the peace, with certain stated salaries. Before thefe all petty delin-
quencies are tried, and by them they are punished. "Tan-
nists," or guard-houfes, are erected in the different districts of the town; and the peace is maintained by a few compa-
nies of native fowlers who patrol the streets, and prevent disturbance from quarrels, robbery, or theft. Offences of a higher nature, committed by either Europeans or natives, are cognizable by the fupreme court of judicature, which, about 25 years ago, was fubstituted in place of the mayor's court, with superior authority, and more extensive jurisdiction. The powers of this court extend not only to the company's territories in this part of India, but also to every civil or criminal, that may occur between the Coromandel and Malacca coasts. Its jurisdiction, however, does not extend to the higher factions; nevertheless in these, all the European settlers enter into an engagement to be amenable to its authority.

The commerce of Calcutta is very considerable in falt, sugar, opium, yielded by the poppy particularly cultivated in the province of Balhar, fikhs, mulius, &c. Muffs, borax, and other commodities, used to be imported from Thibet, in exchange for European cloths, and hardware; but this trade is probably interrupted since Thibet became subject to the jealous Chinefs. On the Ganges are transported to Asam cargoes of falt, in exchange for gold, filver, ivory, muffs, and a particular kind of fily cotton. The cowry fells, used as a small coin, are imported from the Madlyyes in exchange for rice. The fine muffs are chiefly fabricated in the rainy season, from May to September, and with calli-
goes form a great part of the exports to Europe.

The merchants and agents of this capital are by no means confined to transactions with their confidents employed in different branches of the service; they engage largely in foreign commerce to every port of note either in Asia or in Europe. In fome houses, the extent of their dealings has been diminished, probably by an account somewhat ex-
aggerated, at two crores of rupees annually, or above two millions fterling. Nevertheless, no merchantile house has ac-
cumulated fums equal to the fortunes acquired by many in-
dividuals in the service. The charges of clerks, freight, furance, and other circumstances, particularly houfe-rent, muft deeply affect the profits arising from every concern not uncommonly lucrative. The extent of the private trade of Calcutta cannot be eliminated juftly, either from the number or the burden of the ships belonging to that port. In a period not very remote, there were only 60 that properly belonged to the British merchants here, and their burden was about 27,000 tons. But their concern in foreign ships is very considerable. The Dutch, Danith, and French settle-
mants on the river afford opportunities for indirect trade to any extent; nor are they negligent in availing the u-
felves of this advantage. The company affords considera-
fle employment to the country-built ships, independently of the merchants. It polfifes a marine establishment, under the direction of a board instituted for that purpofe. During war, cruisers are frequently employed, as well as transports, and ftre-hips, for its own troops. These transactions fall under the direction of the marine board, confifting of five members, and a number of subordinate officers and clerks. It also superintends the pilot-service, which is an important part of the marine establishment in a river of fuch dangerous navigation as the Hoogly, in which fand banks formed by the land and mud wafted down this branch of the Ganges during the rains, are continually ftantuating in their fize and position. Conflant attention is, therefore, necessary to place the different buzo's toe that they shall not mislead the mariner.

Freight in this climate is high; and yet commerce appears to be as adventurous as in any part of the world. The freight of boats in the inland trade upon the river is far from being low; and this is owing to the time nec
ecessary for performing a moderate voyage on that winding stream. The larger boats upon the Ganges carry from 300 to 600 mauns; and their hire per month amounts to 20, 30, or even 60 rupees, according to their different fizes. Budge-
rows (see Budge-row), for the accommodation of gently-
men and their families, are to be had of all fizes from 8 to 24 oars; the rate of hire for the firfl is 60 rupees per month; for the laft, 230. The pinace is another kind of travelling boat, full more expensive than the budge-row. It has fe-
rior accommodation, and from its reffembling European craft in its structure, both in its hull and rigging, it is better fitted for encountering a gale in the great river. Besides the high rate of freight charged in the inland, and maritime trade, the merchants in Calcutta pay a considera-
ble commiffion on the purchase of goods by their agents; and this on most articles is 5 per cent. The mafiers of the country built ships, or the supercargoes, are the immediate agents by whom the trade of this part of the world is con-
ducted; and they are an enterprising body of men, and in general better informed than those of the fame profession in Europe. With the common Malays, and a mixture of Chinefs, and Bengalfe famen, who never become very expert and intelligent in their profession, the country ship-
masters perform voyages in fome dangerous fens with astonishing feceurity. Thofe vefcls are termed "Donies"; and their enterprifes at sea are chiefly to be ascribed to the example of Europeans; for, before their appearance, the Hindoos were hardly known as navigators. In Calcutta there are fix differ-
ent affurance-companies; which cover the property of in-
dividuals from the risks of the sea, perhaps at as low a rate of insurance as it can be done in Europe. Of the ships already mentioned belonging to Calcutta, there is not a fingle one commanded by a native. The internal navigation is, indeed, conducted by the natives. See Ganges.

The Armenians are the moft refpeetable, and perhaps the moft numerous body of foreign merchants in this capital. They carry on an extensive trade from China, and moft of the ex-
ports to the eafthward, and also to the west, as far as the Persian gulf. Their information from all the differ-
ent quarters is deemed the moft accurate and minute of any body of men in their profession. They are attentive, regu-
lar, and diligent in business; their houses are of old standing; and many of them are possessed of large capitals. As members of society, they are peaceable and loyal, polite and inoffensive. Some few priets of their perfonation are main-
tained by them, not only in affidence, but in some degree of splendour. In their fondnefs for ftreem and elegance, the Armenians approach nearer to the English than any mer-
chants at Calcutta; but they are more guarded in their ex-
penditure.

The Mogul merchants are the next body of strangers, who have indeed long resided in this country; they have 13 different mercantile houses of confiderable note, besides many other counting-houfes of inferior importance. Some individual among the Moguls are very wealthy, and are inferior in riches only to some of the native rajahs, banians, and sroiffs; of these fome are more opulent than the firft noble-
men in England. A million fterling, or even half of that sum, which feveral of them are paid to poifees, yields a re-
venue of three times the amount of any capital in Britain, from the exhorbitant rate of interest at which these people lend their money. In the drefs and table of the Hindoo, little is devoted to the purposes either of elegance or mag-
ificence,
CALCUTTA.

nificence. The greatest drains upon his income are his pious contributions, and the expenses of his Zemana. The notches, marriages, and religious festivals furnish occasions of profusion; but these ceremonies are under the direction of the Brahmins; and, according to the ideas which these spiritual guides have formed of his wealth, must be the otto, rofe-water, and other perfumes, and sweetmeats served in velvets of gold, under a large canopy illuminated with beautiful lutes, to many hundreds of guests of all ranks and denominations. On such occasions the Hindoo is gratified by the appearance of a large company; and dresses himself particularly honoured by the attendance of Europeans. Although the notches are intended to do honour to some deity, who is supposed to preside over the festival; yet they seem of all institutions least calculated to excite religious ideas. Part of the ceremony consists in listening to the music of the singing girls, who draw out their monotonous ditties with a non-achance and dulness which can only be equalled by the sluggish dance, and inanimate gestures with which they are accompanied. Of all entertainments an Hindoostane notch is probably the most stupid; and they are sometimes accompanied with pantomimical performances of no delicate nature.

The number of Greek merchants in Calcutta is not considerable; they, however, maintain one clergyman, who performs religious worship according to the rites of that church. Portuguese houses of agency are, with respect to number, next to those of the English. A very considerable number of the descendants of that nation by native women reside at Calcutta. No people in Europe seem to have alienated themselves so closely to the manners of the country. Many of these chiefs are held in low estimation. With a complexion darker than that of the Hindoos, with habits less familiar, and with full possession of the language, it is strange that none of these have been able to make converts from the Heathen to the Roman Catholic faith. This circumstance evinces the complete dominion, which the Brahmin superstition possesses over the minds of the common people; for no denomination of Christians can be more devoted to the work of conversion than the church of Rome.

The British merchants at Calcutta are a numerous and respectable body of men. Several of them have acquired large fortunes, and in the acquisition of those fortunes they have displayed those mercantile talents, and that enterprising spirit which distinguish their character in every part of the world. At Calcutta the peculiar habits of their profession have in no degree encroached on the liberality of their minds or the elegance of their equipage and tables. They here display an expense and splendour in their mode of living seldom admired after by the same order of men in any part of the world; and it redounds much to their honour, that their acts of charity and munificence to indigent persons have, perhaps, never been equalled by any similar number of men of any rank whatever. Few of these gentlemen are engaged in the service. The service of the company attaches itself to itself certain ideas of rank and consequence, which often produce ludicrous effects upon the intercourse of society. All persons in civil and military departments affect a degree of superiority over such as are not in the service, which is frequently ill supported by their talents, birth, or character.

Among the various classes of the mercantile part of the community, we have made no mention of the Jews. Few of that nation ever settle in India, and Calcutta is perhaps the only opulent town in which they are not to be found. The native Banians, Sarkars, and Writers, carry on the greatest part of the retail trade of Calcutta. They go about hawking commodities from morning to night, or searching after cheap purchases. To this class of the Hindoos appertain that low cunning, flirtation, and deceit, which characterise the money-transactions of persons of narrow intellects. With all their propensity to cheat, the native shop-keepers generally fill their goods on lower terms than those on which they are to be obtained in the European ware-rooms; but they are commonly neither of the first fashion nor best quality. Their house-rent is another cause of their under selling the Europeans. The shops of the natives, though better than their houses, are mean and disagreeable; and from their situation in the common bazaars, are much cheaper than the larger and more splendid rooms in which the British merchants expose their wares. House-rent and servants' wages are the most expensive parts of the charges of housekeeping in Calcutta. The common articles of provision are much cheaper in Europe; but house-rent till lately, has been a very exorbitant charge. Only a few years ago, a house sufficient to accommodate a genteel family could not be procured under 600 or 800 pounds a-year; and many even let at a larger sum. The number of servants necessary in a private family, to perform their duties in this country, exceeds all belief. This is an evil which admits of no remedy as long as the superintendence of the natives shall deter them from performing service beyond one specific kind of work. The wages vary according to the different stations they occupy, from 4 rupees per month to 20. The salary of servants, added to the house-rent, and the incidental charges of a family, will enhance its expenditure to 3, 4, and 5 thousand rupees a-year, according to its number.

The maintenance and education of the children belonging to Europeans in India have, on account of their increasing number, become objects of great importance. With a view to these objects, several perors have done honour to themselves and to their country, by establishing schools for the relief of the orphan children of the military servants of the company. Two institutions have been formed for this purpose: one for the children of officers, and the other for those of private soldiers. Each is provided with teachers of both sexes, qualified to instruct the children in such branches of knowledge and industry as seem to be adapted to their rank and prospects in society. The fund for the support of these institutions is supplied by a fixed contribution raised from the military, or by the donations of the benevolent. Besides the two institutions already mentioned, there are seven or eight others for the education of boys; and nearly an equal number for girls. Besides these foundations, there are some others of inferior note, equally laudable, established by the munificence of the inhabitants of Calcutta. A free-school, which provides for the education of nearly 200 children, under the management of the vestry, is, in part, supported by voluntary contributions only. Two lacks of rupees were originally devoted to the education of the children of the poor. The interest of that sum continues to be applied for that purpose. Another school, equally numerous, has been added to this upon a fund raised merely by casual benefactions. An oratorio has lately been performed annually to aid its funds, which promises a considerable supply of revenue. To these institutions, so creditable to the humanity and benevolence of the inhabitants of Calcutta, the native hospital must be added. This institution is also supported by voluntary contribution, and was formed for the relief of natives, who, from accident or disease, might need medical aid. A very expensive establishment for the education of the junior servants of the company has lately been instituted; but as it is for business, and not for education, that these gentlemen are sent to India,
India, the utility of this measure has been questioned, and
the expense of it must have been enormous. Instruction, in
the native dialect, is, in general, the only requisite to qua-
lify them for the exercise of their duty, and this they have
hitherto received from "Mooneaces" at the leisure hours
that are not employed in their different vocations. Accord-
ingly the court of directors have abolished this college;
and this are at this time forming an establishment at home
which is likely, under proper conduct, to answer the pur-
pose at a much less expense.

Notwithstanding the perfection to which the medical art
has arrived by long experience, and its happy effect in pre-
venting the lives of many Europeans; and the knowledge
that has been acquired with respect to the fevers and the
whole train of bilious complaints that are incidental to the
country, and with respect to the most efficacious mode of
treating them; the climate of India proves a severe trial
every European constitution. Many fall sacrileges to its
fever attacks; many more linger on in a state of increasing
dubity, and painful disease; and others, who for years con-
tinue to combat its influence, apprehending that the conflict
must terminate fatally, are glad to retreat to Europe, there
to seek out, or to husband the remains of life. A fallow
and livid complexion is so universal in Bengal, that when
you behold a face of the roteate hue, you may venture to
pronounce that its owner is newly arrived. Even in the
ordinary health of persons not supposed to be materially in-
jured by the climate, they are capable of little exertion or
fatigue; and in the hot season of hardly any at all. It is
not uncommon to find, at that period, all the officers of a
battalion, except perhaps one or two, incapable of doing
; and this without any extraordinary or alarming com-
plaint. The fair sex are almost equally liable with the men
to suffer by the climate. Their regularity is often more
uniform, and their exposure to the weather less frequent;
yet there is hardly a single female complexion in Bengal
that retains the bloom of health. Formerly female adven-
turers in India were few; but highly successful. Embold-
ened by their successes, and encouraged by their example,
such numbers have embarked in this speculation, as threaten
to defeat its purpose. The irregularities of our government,
which formerly afforded an opportunity to some of rapidly
accumulating wealth, and enabled them to marry, are now
in a great measure done away. Few comparatively find
themselves in circumstances that invite to matrimonial en-
gagements; and on this account a number of unfortunate
females are seen wandering for years in a single and uncon-
ected state. Some are annually found to abandon the for-
lorn hope, and return to Europe, after the loss of beauty,
too frequently their only property.

Having mentioned the "black hole" at Calcutta, which is
become proverbial among Englishmen for place of insufferable
torment, we shall now recite some further particulars con-
cerning the tragic event to which we have referred. When Sur-
ajah Dowlah in 1756 reduced Calcutta, the English prisoners
to the number of 146, of whom Mr. Holwell was one, were
confined in the black hole prison. It was about eight o'clock when these 146 unhappy persons, exhausted by con-
tinual action and fatigue, were thus crammed together into
a dungeon about eighteen feet square, in a close, sultry night
in Bengal; shut up to the eart and south, the only quarters
from whence air could reach them, by dead walls, and by a
well and door to the north; open only to the well by two
windows. Strongly barred with iron, from which they could
receive scarce any circulation of fresh air.

They had been but few minutes confined before every
one fell into a perspiration so profuse, that no idea can be
formed of it. This brought on a raging thirst, which in-
craved in proportion as the body was drained of its moil-
iture. Various expedients were thought of to give more
room and air. Every man was flipp'd, and every hat put
in motion: they several times sat down on their hams; but
at each time several of the poor creatures fell, and were in-
stantly suffocated or trod to death.

Before nine o'clock every man's thirst grew intolerable,
and respiration difficult. Efforts were again made to force
the door, but still in vain. Many inflicts were used to
the guards, to provoke them to fire in upon the prisoners, who
grew outrageous, and many delicious. "Water, water," be-
came the general cry. Some water was brought: but
these fupplieys, like sprinkling water on fire, only served
to raise and feed the flames. The confusion became general,
and horrid from the cries and ravings for water; and some
were trampled to death. This scene of misery proved enter-
tainment to the brutal wretches without, who supplied them
with water, that they might have the satisfaction of seeing
them fight for it, as they spared it; and held up lights to
the bars, that they might lose no part of the inhuman
verdict.

Before eleven o'clock, most of the gentlemen were dead,
and one third of the whole. Thrift grew intolerable: but
Mr. Holwell kept his mouth moist by sucking the perspira-
tion out of his shirt-sleeves, and catching the drops as they
fell, like heavy rain, from his head and face. By half an
hour after eleven, most of the living were in an outrageous
delirium. They found that water heightened their uneasi-
nesses; and "Air, air," was the general cry. Every infust
that could be devised against the guard, all the opprobrious
names that the viceroy and his officers could be loaded with,
were repeated, to provoke to fire upon them. Every man had eager hopes of meeting the first shot. Then
a general prayer to heaven, to lessen the approach of the
flames to the right and left of them, and put a period to
their misery. Some expired on others; while a flame arso
as well from the living as the dead, which was very
offensive.

About two in the morning, they crowded so much to the
windows, that many died standing, unable to fall by the
throng and equal pressure round. When the day broke, the
French arising from the dead bodies was insufferable.
At that juncture, the Sonbabs, who had received an account
of the horrid death had made among them, sent one of his of-
icers to inquire if the chief survived. Mr. Holwell was
shown to him; and near six, an order came for their relea-

Thus they had remained in this infernal prison from eight
at night until six in the morning, when the poor remains of
146 fossils, being only 23, came out alive; but most of them
in a high mortal fever. The dead bodies were dragged out
of the hole by the soldiers, and thrown promiscuously into
the ditch of an uninhabited ravine, which was afterwards filled
with earth. See Bengal. Rennell's Memoirs, Pinker-

CALDA, or CALDUM, in the Ancient Diet, denotes hot
water, used much among the Romans, anciently, as a
drink, partly for pleasure, and partly for health.

The word is formed from calitus, hot; aqua being under-
stood; calit, q. d. calida aqua.

Lipius, Caltallo, Mercurialis, Baccius, and Freinhen-
mius, have treated largely de potu calde, or caliti. Aet.
Erod. Liof.

CALDAO, in Geography, a river of Portugal, which runs
into the sea, at Setubal.

CALDARA, Antonio, in Biography, and Musical
History, was a native of Venice, a great harmonist and com-
His the Calder-houfe, an tranflation and but town year, pieafant Tirabofchi. remarkable the Gallicia, a May river confequence continued, gravity and reckoned In purity 1682. Madrid, guide the ilyle profufe ceaft liis it during of fo operatherates AdriaTioin8vria; m mony, water, the rel Helen Caldas, a city, and adjoining to it an hospital for poor patients. Besides the springs used for drinking, three others supply four baths; and the united water from all the springs turns a mill near the bathing house.

Caldas de Rey, a town of Spain, in Galicia, 20 miles south of Santiago. Calder, a town of Midlothian in Scotland, situated in a pleasant country, at the distance of 12 miles west of Edinburgh. Here are two annual fairs, and a weekly market; but there is no manufactory, the population is but small. In 1792, it amounted to 562 inhabitants. A short distance west of the town, is Calder-leve, the seat of lord Torphichen. This mansion is memorable in the ecclefeial history of Scotland, as the place where the Sacrament was first administered after the reformation. The ceremony was performed by John Knox, the celebrated reformer, a portrait of whom is preferred in the house.

Calder, a river of England, which runs into the Clyde, about two miles north of the town of Inverary. It is navigable to Halkirk. Also a river, which runs into the Clyde, three miles south of the town.

Calder Water, a river of Scotland, which runs into the Clyde, about five miles above Glasgow.

Calder, a remarkable mountain in the Gulf of Venice, which is a guide at sea for the harbour of Rovigo, which ice.

Caldero, Cape, lies on the north coast of South America, W. of Otterby, and about 12 leagues N. by E. from the Caracas fort, called the White Cape. It lies nearly S. or a little westward from the town of Margarita Island, on the coast of the Spanish Main.

Calderon, de la Bana, Don Pedro, in Biography, a celebrated Spanish dramatic writer, flourished about the year 1640, and after having borne arms, and obtained the rank of a knight of the order of St. James, became an ecclesiastic, and a priest and canon of Toledo. Turning his attention to the theatre, he acquired the reputation of the most copious and esteemed writer for the stage, in Spain, and was sometimes denominated the Spanish Shakespeare. His fertility of invention, and the taste of his age and country, rendered him incorrect in the observance of the rules of the drama, and very unequal in his style and composition. His characters are unnatural, and his dialogue incoherent. His chief excellence consisted in the contrivance of plots, which are full of business, and abound in intricacies happily resolved in the catastrophe. Most of his works were collected and published at Madrid, in nine volumes, 1690. the three first containing farces, melodramas, and the rest, a number of dramatic pieces on religious subjects, like the Old Mysteries, under the title of Autos Sacramentales. His scanty knowledge of history has betrayed him into several blunders. Nouv. Dict. Hist.

Calderon, in Geography, lies on the coast of Coromandel, in India, five leagues N. from Tranquebar.
CALDERBURG, a township of Orleans county, in the state of Vermont, America, about 131 miles N.E. from Bennington, and 11 miles W. of Connecticut river.

CALDERWOOD, David, in Biography, a presbyterian divine of the church of Scotland, was the descendant of a good family in that kingdom; and being early defined to the ministry, he acquired, in the course of his education, an extensive acquaintance with those subjects that were particularly appropriate to his profession. About the year 1604, he was settled at Crielting near Jedburgh. Zestfully attached to the presbyterian establishment, he disapproved the project formed by King James I. of Great Britain, for bringing the church of Scotland to a nearer conformity with that of England; and when Mr. James Lauv, the bishop of Orkney, made a visitation of the presbyteries of Morfe and Tivottdale, as a preliminary towards suspending episcopal powers, he declined his jurisdiction by a paper under his hand, dated May 3, 1658. Thus did he commence that resistance to the measures of the king and episcopal party, which uniformly directed and influenced his future conduct. Accordingly, he did not assist at the general assembly held at Glasgow, May 8, 1616, in which lord Dunbar, the high treasurer of Scotland, presided as commissioner; and it appears from his writings, that he regarded all the transactions of this assembly as null and void. He also excepted against the proceedings of another general assembly held in 1616, at Aberdeen. When a parliament was held by the king in the following year at Edinburgh, and the clergy met, at the same time, in one of the churches, in order to confer with the bishops, thus contriving an assembly which was intended to resemble the English convocation; Mr. Calderwood, though he attended, publicly declared, that he did not consider any such meetings as resembling a convocation: and when he was informed that a bill was depending to empower the king, with the advice of the archbishop, bishops, and such a number of the ministry as his majesty might think proper, to consider and conclude as to matters decent for the public policy of the church, not repugnant to the word of God; and that such conclusions should have the force of ecclesiastical laws; he concurred, with other ministers, in a formal protest against the measure, for reasons which were subjoined. This protest was prefixed; and though the clerk-register refused to read it before the statutes in parliament, it had its effect: for although the bill had the consent of parliament, yet the king thought fit to set it aside, and soon after called a general assembly at St. Andrews'. In consequence of this protest, Mr. Calderwood was summoned before the high-commission court at St. Andrews', on the charge of mutinous and seditious behaviour. The king was present, and examined him in person; but Calderwood defended himself with such spirit and presence of mind, that in his refutation to acknowledge that he had been guilty of any crime, that he was first committed to prison; and then sentenced, by the privy council, to banish himself out of the king's dominions, and not to return without licence. All his efforts for mitigating this sentence proving ineffectual, he retired to Holland, where he steadily maintained his former principles, and in 1623, published his famous book, entitled "Altar Damafenny, seu Ecclesiae Angliciae Politia, Ecclesiæ Scotianæ obtra, a Forma ducta quadrada delineata, illiuftrata et examinata." This work contains a close and rigorous examination of the policy of the English church, under various heads, in which the origin and authority of episcopacy, and all the other points of difference, between that and the presbyterian churches, are discussed. King James is said to have expressed a high opinion of this work, though he was extremely displeased with it; and it is certain, that it made a great impression in England, and was very much admired by all avowed Puritans, and by such as were well-tilers to their opinions. The modern divines, however, would not concur in many of the author's sentiments; nor would they contend for the "Jus Divinum" of Presbytery. Soon after the publication of this work, Mr. Calderwood returned to Scotland, and lived privately for several years. As his situation was unknown, he had been unilltied in 1624, with a long and dangerous fit of sickness, a person, whose name was Patrick Scot, taking it for granted that he was dead, wrote a recantation in his name, purporting, that before his decease, he had changed his sentiments; but when this imposition was detected, he went over to Holland, and made diligent search for him, with a delign, as Mr. Calderwood believed, to have dispatched him. During his retirement, it is not unlikely, such were his talents and temper, that he wrote several books against the proceedings of the clergy in Scotland. But it is more certain that he employed himself in diligently collecting all the memorials relative to the ecclesiastical affairs of that kingdom, from the commencement of the reformation to his own time. Thence he digested and methodized with great care, and the whole is extant in MS. in the library of the University of Glasgow, in six folio volumes. Of these, an extract has been published, under the title of "The true History of the Church of Scotland," printed in 1618, which comes down to the death of king James. Although the perusal of this work, on account both of its spirit and style, cannot be disagreeable, and the representations contained in it must have acquired a strong tinge from party; it has, nevertheless, been always regarded as a source of much authentic information. How much longer the author survived is not known; but it seems probable, from his mentioning the death of Robert Bruce, which happened in 1631, that he lived pretty far in the reign of Charles I.; and we find that he was minister of Lenzie-land, near Edinburgh, in 1638. Biog. Brit.

Caldronazzo, in Geography, a lake of Germany, in the county of Tyrol; 8 miles E.S.E. of Trent.

Caldron, a large kitchen utensil, commonly made of copper; having a movable iron handle, whereby to hang it on the chimney-hook.

The word is formed from the French chaudron, or rather the Latin caldarium.

Caldrons, boiling in, calidriis decouers, is a capital punishment spoken of in the middle age writers, decreed to divers sorts of criminals, but chiefly to debaters of the coin. One of the torments inflicted on the ancient Christian martyrs was boiling in caldrons of water, oil, &c.

Calduba, in Ancient Geography, a town of Spain, placed by Ptolemy in Baetica, in the territory of the Turdetani.

Calduendo, in Geography, a town of Spain in the province of Guipuzcoa; 8 leagues east of Vitoria.

Caldy, a small island in the great bay of Carmarthens, in South Wales; on its west side, at S.S.E. from Tenby, forming an inner limit on that side to the bay, though it stretches out circuitously to St. Owen's point. It is about 3 miles from Tenby, and 5 leagues almost west from Wormshead, and has upon it a white tower appearing at a distance like a white sail, and serving to show where the land lies. Ships may anchor on every side of this island, and be sheltered from all winds. N. lat. 51° 33'; W. long. 5° 19'.

Cale, or Kale, in Botany. See Brassica, Dorecole, and Creosme.

Cale, in Scripture Geography. See Calah.

CAL

Gen. Ch. Cal. imbricated; scales oblong, rather loofe. Cor. uniform; florets hermaphrodite, numerous, equal, funnel-shaped; border five-cleft. Stam. filaments five, capillary, very short, anthers forming a cyndrical tube. Pijl. germ a little oblong; style thread-shaped, the length of the corolla; stigmas two, recurved, acute. Peric. the permanent calyx. Seeds solitary, oblong; down simple or none. Receptacle chaffy; scales a little longer than the calyx, standing out conspicuously among the florets.

Obf. A feed with a simple down forms part of the generic character of Calos, as drawn up by Linnaeus; and yet that character is found in only one of his own species. We have therefore found it necessary to exclude it from the essential character, in order to admit the oppositifolia and amellus; as Martyn and La Marché had already in some degree done; though we confess that, with the omission, the genus is not sufficiently discriminated from some others. The whole class fyngetia certainly stands in need of accurate investigation and cautious refinement. But this is a task on which we have no leisure to enter. We apprehend that we discharge our duty to the public, if we lay before it the present state of the science, and point out such deficiencies as occur to our notice. The scoparia, which Linnaeus at first made a chrysocoma, having a naked receptacle, cannot be a calca. As it differs from chrysocoma in the structure of its down, we have adopted the genus formed for it by Gartner.

Propagation and Culture. Thse plants may be propagated by seeds, treated like other natives of warm climates.

CALEAL, in Geography, a town of Persia, in the province of Aiderbizes, 142 miles S.E. of Tauris.

CALEB, in Scripture History, the son of Jephunneh, one of the messengers depcuted by Moses to explore the land of Canaan. Caleb and Joshua returned with a favourable report, revived the defeated spirits of the Israelites, and assured them of success in their projected invasion of the country. On this account it was predicted by Moses that they were the only two persons of all the people that came out of Egypt, who should live to enter the land of Canaan. Caleb was at this time 40 years old. After the Israelites, under the command of Joshua, had taken possession of Canaan, B. C. 1451, he divided the land in the year B.C. 1452; upon which Caleb obtained for himself the portion of the mountains and city of Kirjath-Arba, or Hebron, a district possessed by the three sons of Anak. Finding it difficult to expel them from the town of Debir, he promised his daughter Achsah as wife to any one who should take it. This was effected by Othniel, the son of Kenaz, Caleb's younger brother, who accordingly married Achsah. Caleb then settled at Hebron, and is laid to have lived in peace to his 114th year. Numb. xiii. xiv. Joshua xv. Judges 1.

CALEB, in Scripture Geography, a district of Judah, in which were the cities of Kirjath-Sepher, and Hebron, belonging to the family of Caleb. 1 Sam. xxx. 14.

CALECASIA, in Geography, a market town of Corsica, in the district of Nide.

CALED, or KHALED, Eben al Wald, in Biography and History, one of the most valiant, successful, and furious of Mahomet's captains, belonged to the tribe of Ko- reish, and began his military career with opposing the pretended mission of the prophet; and at the battle of Ohod, contributed by means of the wing which he commanded to the defeat of the Melems. Being afterwards converted, he became a principal champion in the impotior's cause, and obtained from Mahomet the honourable title of "one of the three leaves of God." This title was conferred upon him in consequence of the battle of Muts, A. D. 639, in which, after the fall of three succedive commanders of the Melems, he assumed the standard, and by his valour withstood and repulsed the superior numbers of the Chirilians. Upon the accession of Ahubecker, he was deputed with a small army to counteract the revolt of several Arabian tribes, whom he completely
C A L

plate C. 2 4. 1. He afterwards obtained a more important station by the popular Melecham, who fell in the battle, and whose brilliant victories were compiled to embrace the region of Damascus. In his subsequent invasion of Iraq, the ancient province of Babylon, he was eminently successful, and terminated his expedition by the capture of the city Hasana by the Persians, and the extinction of the kingdom, which took its name from that capital. From thence he was summoned to Syria to support the Mo-llums under the command of Abu Obeidah, who had met with several checks from the Greeks, and being appointed to supersede that general, he found the aspect of affairs. Having reviewed the detachment that believed Buften, he erected this place, and sided by treachery, took it. To the inhabitants, with a fierce and quarter, he bestowed himself mercifully, and redeemed the charge which they were suffering. On his arrival before Damascus, he vanquished by his personal valor two Christian commanders, and on their refusal to embrace Islam, put them to death in cold blood. Having collected a powerful body of Moizzins at Aemadin, in the year 6 5 3 , he totally discomfited Werdan, the general of Heraclius, and destroyed the greatest part of his army. During the progress of the siege of Damascus, many exploits of valor were performed by both parties; at length, however, the siege having been prolonged 7 days, the inhabitants sought refuge in the midst and general disposition of Abu Obeidah from the fury of Caled, and flung to surrender the place on moderate terms. In the mean while Caled interposed, prevented the execution of the treaty, and with savage ferocity, put to the sword all that came in his way; and meeting with Abu Obeidah, who was peacefully entering the city, a conflict ensued; one inflicting on the right of the sword, and the other urging the sacrefices of a capitulation. Caled in the stroke yielded to the pleas of mercy and true policy; and the sword was sheathed, on condition of admitting to tribute and toleration of religion those inhabitants who chose to continue in the city. The adherents of Thomas, however, who had fought under his banner in the defence of the city, embraced the alternative of poverty and exile. Accordingly in an adjacent meadow they formed an encampment of priests and laymen, of soldiers and citizens, of women and children; and being allowed to take with them their most precious moveables, and arms necessary for their defence, they prepared to abandon their native homes. Caled, whose in-\r\r\nvisible soul was not touched by the spectacle of their distress, ordered and recommended their departure; and firmly declared, that after a respite of three days, they might be pursued and treated as the enemies of the Moizzins. Unfatted with blood and vengeance, and further urged by the intercessions of Jonas, a noble Damascus, whose betrothed spouse had accompanied the fugitives, Caled at the head of 4000 horse, in the disguise of Christian Arabs, undertook the pursuit. Accordingly he traced their march across the mountains of Libanus, encountering incredible hardships, to the vicinity of Laodica, and in a pleasant valley where they had pitched their tents, rushed on the promiscuous multitude, insufficiently provided with arms, and already vanquished by for\r\nr\n
Ray and famine. In consequence of this furious onset and indiscriminate slaughter, the Arabs enjoyed the satisfaction of believing, that not a Christian of either sex escaped the edge of their scythes; and all the rich spoils of the victimes fell into the hands of the conquerors. In the tumult of the battle Jonas found the object of his pursuit; but her resentment was inflamed by the la\v\n act of his perfidy; and as Eudocia struggled in his hateful embraces, she struck a dagger to her heart. Caled had penetrated, on this occasion, about 150 miles into the Roman territory; and having completed this bloody tragedy, which has afforded a striking subject both to history and poetry, he returned to Damascus with the same secrecy and speed.

On the accession of Omar, who succeeded Abubeker in the caliphate, Caled was removed from the command; and it was again transferred to the more gentle and conciliatory Abu Obeidah. The army expressed their dissatisfaction with this change: but Caled, notwithstanding the characteristic ferocity of his temper, submitted to it with magnanimity; and having caused Omar to be proclaimed caliph at Damascus, resigned his command without hesitation, declaring his readiness to serve the Mussulman cause in any post which it should please the head of the religion to assign him. Soon afterwards his activity and enterprise were of signal service in relieving a party of the Moizzins, who had ineptly marched to plunder a famous monastery in the neighbourhood of Abyla, and who were surrounded by a much superior force. Caled himself had been relieved in familiar circumstances of danger, on a reconnoitering party, by a detachment sent by Abu Obeidah. Under this chief Caled served in Syria and Mesopotamia, and he always distin\r\nx\r

guished himself in seasons of peculiar difficulty and peril. Of his sub\v\nquent exploits the most eminent was the victory obtained by him in the battle of Yermuk, A. D. 6 5 6 ; on which interesting occasion the public voice, and the model of Abu Obeidah restored the command to him, who was esteemed the most defending of the Moizzins. The combat was oblique and bloody; 4230 of the Moizzins were buried in the field of battle; and the skill of the Armenian archers enabled 700 to boast that they had lost an eye in that meritorious service. The Syrian veterans acknowledged that it was the hardest and most doubtful of the days which they had seen; but it was likewise the most decisive. Many thousands of the Greeks and Syrians fell by the swords of the Arabs; many were slaughtered, after the defeat, in the woods and mountains; many, by mimicking the fords, were drowned in the waters of the Yermuk; and however the loscs may be magnified, it was undoubtedly very great. Abu Obeidah, in his letter to the caliph, states the number killed to have been 150,000, and the prisoners at 40,000. This computation exceeds all belief. Such was the success of the Saracens, that the Greek army durst no longer appear in the field; and the conquest of Jerusalem was the speedy result. In 6 5 8 , Caled took Aleppo, and he carried his victorious arms beyond the Euphrates. He survived about three years the piteance of 6 3 9 , which proved fatal to many Mussulman chiefs; but no account remains of the time or manner of his death. His tomb is known in the neighbourhood of Emcia. The valour of this champion was supported by fanaticism; for as long as he wore a cap, which had been blessed by Mahmoud, he deemed himself invulnerable. Mod. Un. Hist. vol. i. Gibbon's Hist. vol. ix.

CALEDON, in Geography, a small town of Ireland, in the county of Tyrone, and province of Ulter, near the river Blackwater, 70 Irish miles N. by E. from Dublin.

CALEDONIA, in Ancient Geography, an appellation by which that part of Great Britain now called Scotland was formerly distinguished. See Scotland. The etymology of this name, as well as the precise boundaries of the country to which it has been applied, have been variously affixed. According to Camden, the appellation of Caledonia is derived from the Celtic or Briton called Caled, hard; whence Caledonia, signifying a people, hardy, unrefined, and rude. Buchanan derives it from the old Scotch word, cailen, denoting a hazel-tree. Others (See Preface to Ossian's Poems, vol. ii. p. 4.) compound it of the two Briton words cael and dun, which signify the Gauls or Britons of the moun-

tains,
Caledonia.

Accordingly it is said, that this was a very proper name for the real Caledonians of Badenoch, Braithbin, and the adjacent tracts, which are the most mountainous parts of Scotland, and not very unsuitable to the other nations, to whom it was given by the Roman authors. Others again affirm, that Gaeu-doch is the only appellation, which the Scots, who speak the Gaelic language, know for their own division of Britain; and Gaeul-doch is a compound of Gaell or Caell, the first colony of the ancient Gaels who transmigrated into Britain, and doch, a district or division of a country. The Romans, by transposing the letter l in Caell, and softening into a Latin termination the ch of doch, formed the well known name of Caledonia.

The ancient Caledonia comprehended all that country which lay to the north of the rivers Forth and Clyde; or, as others state its boundaries, from the wall of Severus, connecting the east coast near Tainmouth with the Solway Firth, at Boulnefs, on the west coast, to the northern shore. The Caledonii of Poltney possesed that extensive tract of country which reached from the Lemanonian bay, or Loch fenn, on the east, to the estuary of Var or Firth of Tayne on the east coast; and included Badenoch, Braithbin, the inland parts of the shires of Murray, Banff, Aberdeen, and Perth. The Greek and Roman historians and poets, who flourished in the first, second, and third centuries, when they have occasion to mention the affairs of Britain, give the general name of Caledonii to all the British nations without the limits of the Roman province, and that of Caledonia to their country. The reason of this might be, that the Caledonii were the most powerful or warlike of those nations, and maintained some kind of superiority over the rest, who were contented to fight under their conduct against their common enemies, the Romans and provincial Britons. Hence the name of the Caledonii, from being the proper name of one nation, became the common denomination of many.

Caledonia seems to have been unknown to the Romans till Agricola entered it with his army, in his third campaign, A.D. 80. Marching from south-west towards the north-east, he traversed the territories of several British tribes, and penetrated to the river Tay, without opposition. The Caledonii seemed to have retired, hoping to recover in the winter, after the retreat of their enemies, what they had lost in the summer. But Agricola disappointed their expectations by employing the remainder of the season in building forts in the most convenient situations for keeping possession of the country. As soon as these forts were finished and flored with provisions, he put his army into them for their winter-quarters, that his troops might be every where at hand to check the attempts of the natives to shake off the yoke. Tacitus does not inform us, whether Agricola spent this winter in Caledonia, or in the more southern parts of Britain. See Agricola.

When Adrian arrived in Britain A.D. 121, he actively employed himself in fortifying the frontiers of the Roman possessions against the incursions of enemies. With this view he erected his famous rampart, or wall, as the boundary of the Roman province, from the mouth of the river Tine on the east, to the Solway firth on the west, near the track where Agricola had built his first chain of forts. See Adrian. Under the reign of Antoninus Pius, A.D. 138, Lollius Urbicus was governor of Britain; and in order to secure the peace of the Roman province in this island, it was found necessary to enlarge its limits. Accordingly Lollius Urbicus defeated the Meatae in several engagements, and recovered the country as far as the Ithamus between the fortress of Forth and Clyde. In order to secure his conquest, and to keep the Caledonians at a greater distance, Urbicus, by direction of the emperor, raised another strong rampart, in imitation of that of Adrian, between those two forts, along the line of forts which had been constructed there by Agricola. This rampart, with its ditch and forts, was intended for the utmost boundary of the Roman empire in Britain. In the year 182, the Caledonians, having broke through the wall of Antoninus, and being joined by the Meatae, invaded the Roman province. To repel this invasion, the government of Britain was bestowed upon Ulpius Marcellus, who, having first reformed the discipline of the Roman troops, led them against the enemy, and defeated them in several battles. During the contest which took place on the accession of Septimus Severus to the imperial throne, Britain became a scene of great confusion, A.D. 198. The Meatae and Caledonians, observing the defection of the Roman province, made incursions into it, and spread de-section in their progress. When Lupus was deputed by Severus to repel these invaders, he found himself unable to accomplish this object by force, and therefore bribed the plunderers to retire, by purchasing their prisoners with a sum of money. Their incursions, however, were renewed with greater violence for several years; and it was found necessary for Severus himself to visit Britain in person. The news of his arrival, A.D. 207, alarmed the Meatae and Caledonians, and induced them to send ambassadors to promise submission, and sue for peace. Severus, however, dismissed the ambassadors without any satisfactory answer, and advanced northward at the head of a very large army. When he had passed the wall of Adrian, he encountered many difficulties and dangers. His army was harried with continual skirmishes, and decayed into many ambuscades; and in his progress, he was obliged to employ one part of his army in cutting down woods, draining lakes and marshes, making roads, and crossing bridges over rivers, whilst the other part defended the labourers from the enemy. In this expedition Severus lost no fewer than 50,000 men, though he fought no battle, and saw no enemies in a body. At length he penetrated into the very heart of Caledonia, and struck such terror into its inhabitants, that they renewed their supplications for peace, which was at last granted them, on condition of relinquishing a part of their country, and delivering up their arms. Having concluded a peace with the Caledonians, and conducted his army back into the northern parts of the Roman province, he employed his troops for about two years in constructing his famous wall. Towards the dilatious decline of his life, A.D. 210, the Meatae and Caledonians took advantage of his weakness and the distraction of his family, and renewed the war in hopes of recovering that part of their country which they had been obliged to resign. The aged emperor, who had retired to York, became pœvish by his complicated sufferings, was enraged by the news of this revolt, and inflicted orders for exterminating these two nations, without sparing the very infants in their mothers' wombs. The execution of these cruel orders was prevented by the emperor's death. His eldest son Caracalla, as soon as he heard of his father's death, concluded a peace with the Meatae and Caledonians, and soon after left Britain.

When the emperor Severus invaded Caledonia, A.D. 207, we are told (Xiphilin. ex Dio Nicéo in Sever.) that the Meatae and Caledonians (who possessed all the island beyond the wall of Adrian), inhabited barren uncultivated mountains, and desolate marish plains; that they had neither walls, housettes, nor cultivated lands; but lived on the milk and flesh of their flocks and herds, on what they got by plunder, or caught by
by hunting, and on the fruits of their trees." Having been
obliged by Severus to surrender part of their country to the
Romans, the indolent people, in the course of the third
century, built several towns and stations, constructed high-
ways, cut down woods, drained marshes, and introduced
agriculture into the country between the walls, many parts
of which are very level, fertile, and fit for tillage. Al-
though the Romans never formed any large or lasting esta-
tlement on the north side of the Caledonian frontier, yet
many of them, and of the provincial Britons, retired into Caledonia at different times, and on various occa-
sions, particularly about the end of the third century, in
order to escape from the Diocletian persecution. It is,
therefore, highly probable, that these refugees instructed
the people among whom they settled, not only in their re-
ligion, but also in their arts, particularly agriculture. The
caledonian coasts of Caledonia were remarkably fit for cul-
tivation, and the Picts, who inhabited these coasts, were very
early acquainted with agriculture, which they undoubtedly
learned from the Romans, or the provincial Britons. The
name which was given to the Caledonians on the east, by
those of the west, was "Cruitnich," which signifies wheats
or corn cakes; a proof that they were husbandmen, and ex-
pressing the contempt or envy of the carnivorous highlander.
There is also reason to believe, that the Caledonians of the
west, who, in the fourth century, began to be called "Scots," denoting, in the Celtic language, wanderers or
vagrants, though they were of a more reticent and wander-
ing disposition than those of the east, and their country was
more mountainous, and not so fit for cultivation, were not
altogether ignorant of agriculture at this period. The
vicinity of the Hebrides, profusely watered along the west-
corn coast of Scotland, tempted the curiosity of these western Caledonians or Scots, and improved their skill; and they acquired, by flow degrees, the art, or rather the habit, of
managing their boats in a tempestuous sea, and of steering
their natural course by the light of the well-known stars.
The ancient Caledonians, and other Britons, educated in the
midst of arms, and accustomed from their infancy to hear
nothing admired or celebrated but valiant deeds in war,
lived upon every premonition but that of arms as unhonorable;
and every employment but war was as unworthy of a man of
patriot. To such an extravagant height did they carry these
abash and pernicious notions of honour, that they imagined
that those who followed any other employment, except that of arms, not only lived defiled, and died unla-
mented; but that their souls, after death, hovered in the
lower regions, among fiends and marlres, and never mounted
the skies, nor mingled with the souls of warriors in the airy
halls. Dio and Herodian seem to intimate, that the Mar-
ex and Caledonians were naked in the beginning of the third
century, when they were invaded by the emperor Severus.
But these authors probably meant no more than that these
people were very imperfectly clothed, or almost naked; and
they use expressions which admit of this interpretation. As
the Romans never conquered the Caledonians, or northern
Britons, they cannot be supposed to have made any material
change in their language; which is still spoken by their po-
pillar, in the highlands, and western islands of Scotland,
with less variation from the original Celtic (if we may be-
lieve some of the belt judges in these matters,) than in any
other part of Europe.

As early as the reign of Conflantine, the inhabitants of
Caledonia were divided between the two great tribes of the
"Scots," and of the "Picts;" the former postulating, as
we have observed, the western; and the latter, the eastern
division of that country. The power, and almost the me-

Tours issued a torrent, which appeared at a considerable distance white with its foaming waters; and trees are found growing in the bottoms of the ravines with which the hills are surrounded. These torrents are numerous, and, in some places, form fine cascades; and they serve also to fertilize the plains and valleys that are interposed among the barren mountains, and which exhibit traces of culture and population. The soil of the plains is a sandy black mould; the sides of the hills are yellow clay with mica; and the higher parts consist of quartz and mica, tinged red, or orange, with iron. Garnets are also found in petro-fles; and in several places white transparent quartz; with layers of gold, coloured mica, blended with serpentine, hornblende, talc, and garnets. New Caledonia differs from all the other islands yet discovered in the South Sea, by being entirely destitute of volcanic productions. Every part of the coast seems to be inhabited; and the plantations in the plains are cultivated with much labour. On the sides of the mountains small walls are raised above one another to prevent the rolling down of the ground which was cultivated. But as the country is for the most part rocky and barren, the inhabitants chiefly subsist on roots and fish. Some of them eat the earth called flette, which they probably make choice of to allay their hunger, because it is soft and crumbles, and is easy of digestion. They also boil, and eat a species of spiders, which are found in the woods. Like many other savages, they feed on the flesh of their enemies, which they previously broil on a fire of charcoal. This horrible practice of eating human flesh is confirmed by several facts recited by D'Entrecasteaux; notwithstanding the favourable accounts given of these islanders by captain Cook and Dr. Forster. They preferred water to wine or brandy; and in drinking it, inclined their heads at about two feet distance above the surface of the water, and then threw it up against their faces with their hands, opening their mouths very wide, and catching as much as they could.

The bread-fruit and cocoa-nut are scarce, and obtained with difficulty; although in some of the interior valleys there are considerable plantations of these, as well as of bananas, Caribbean cabbages (arum cicutarium), yams, fugar-canes, &c. but the island furnishes several new plants, birds, and fishes. The natives seem to be altogether unacquainted with goats, hogs, dogs, or cats, as they had not any name by which to distinguish them. The inhabitants are stout and tall, some of them measuring six feet four inches, and generally well proportioned; their features mild; their hair black and woolly; but many, who seemed to be defirous of having the appearance of long hair, fattened to their own locks two or three turqies, made with the leaves of plants of the graft kind, and covered with the hair of the Vampire bat, which hangs down to the middle of their backs. Some of them cropped their hair short, and used a kind of comb, formed of a number of sticks of hard wood, generally about 20, which they fastened together at one end, and parallel to, and nearly one tenth of an inch from one another; and these combs they always wore in their hair, on one side of the head; on their heads they wore a kind of crown, cylindrical black cap, made of strong paper, which they seemed to consider as an ornament, and which, it was supposed, was worn only by the chiefs and warriors. The custom of pulling out their beards by the root is very general, although some of them let their beards grow. Their skin is nearly as deep as black as that of the inhabitants of Diemen's Cape, whom they very much resemble in the cast of their countenance. These islanders are wholly naked, except that they wear round the middle pieces of coarse stuff, made of bark, or large leaves of trees. In some cafes, pieces of this kind of cloth were fastened by a string round the neck, and to this string were hung small round beads of a pale green stone. They were not defirous of coarse garments made of matting, but they never seemed to use them except in their canoes, and when unemployed.

The women in this island seemed to be in a subordinate and servile state, and employed themselves in various kinds of labour. Their colour is generally a dark chestnut, or a mahogany brown; their stature is middle-sized, rather tall, and their whole form stout and clumsy. They had no other garment besides a kind of fringe, made of the filaments of the bark of trees, which served them as a girdle and palfed several times round the waist. Their character of chaitly is superior to that of the females in the other isles of the Pacific; nor did any instance occur of their permitting any indecent familiarity with an European during eapt. Cook's stay at the island. But the account of their chaitly given by D'Entrecasteaux is not sufficiently their reputation. The lower lobe of the ears, both of males and females, perforated with a very large hole, hung down to their shoulders; and into these holes some introduced leaves of trees, others a piece of wood, in order to stretch them bigger. Several had this lobe jugged; probably from having been torn either in battle, or in running through the woods. Their general ornaments are ear-rings of tortoise-shells, necklaces, or amulets, made both of shells and stones, and some of twisted threads, suspended from which they usually carried at the end of a string a small piece of human bone, or hard stone, indifferently carved; and bracelets made of large shells, which they wear above the elbows. By the account of Cook and Forster, the Caledonians are represented as different from the other natives of the South Sea islands, with regard to their honesty and the inoffensive ness of their disposition and manners. This account is not confirmed by D'Entrecasteaux. He says, that whilst they asked for fluffs and iron in exchange for their effects, they soon gave evidence of their being audacious thieves; and he mentions several instances of the ferocious ness of their dispositions, such as their feeding on the flesh of children, &c. Of their being cannibals there is no doubt; and they are furnished with an instrument, made of stone, with sharp edges, for cutting up the limbs of their enemies, which they divide among them after a battle. Their huts or huts are circular, formed in the shape of beehives, about ½ to few in height, and as much in breadth, close and limed, as there is no passage for the smoke but through the door. Some of these huts are scattered at the distance of three or four hundred paces from each other, and overshadowed by a few cocoa-trees. Some of them are surrounded by palisades ½ yard high, and ½ feet from the borders of the hut, with a narrow walk before the door. The door, about a yard high and half a yard wide, is sometimes closed by a piece of the limb of a cocoa tree, the leafy branches of which are interlaced. Of these doors some had two polls, at the upper extremity of which a man's head was rudely carved. The lower part of these huts is erected perpendicularly to the height of a yard, and then tapered off in a pretty regular cone, and terminated by the upper end of a poll, fixed in the centre of the floor. The frame of the hut consists of poles, bearing against the upper end of the poll, which rises from the middle of the floor, and is near three inches in diameter at the bottom. A few pieces of wood bent to an arch, render these little habitations sufficiently strong. They are covered with straw to the thickness of two or three inches; and the floor, on which the natives are perfectly sheltered from the weather, is laid with mats. Within the hut on one side is a board, fastened with cords in an horizontal position, about a yard from the ground, on which...
which they deposit anything out of the way. The magotties, however, are to troublesome in these huts, that they are obliged to light fires to drive them away when they go to sleep; and as there is no vent for the smoke, except at the door, they must be extremely recommended by it. Near the base of their dwellings are little hillocks of earth, 12 or 14 inches high, with a very open trellis in the middle, of the height of two or three yards; called by the natives "Nabout," which are the graves in which they bury their dead. Those in which their chiefs, slain in battle, are interred, are decorated with spears, darts, paddles, &c. stuck upright in the ground about them. Their canoes are made of two trees, hollowed out, having a radius grumul about two inches high, and closed at each end with a bulk-head of the same height; so that the whole resembles a long square trough about three feet shorter than the body of the canoe. Two canoes thus fitted are fastened to each other about three feet asunder, by means of crofs-spears, which project about a foot over each side, and form a platform. Their mail is fixed at an equal distance from the two canoes, and towards the front of the platform, by which they are joined together. On the platform they have a fire-hearth, and generally a fire burning. They are navigated by one or two latteen falls, extended to a small latteen yard, the end of which is fixed in a notch or hole in the deck. Each canoe has a large hole, fastened to a long rope, which serves as an anchor. These canoes, however, are not so skillfully constructed as those of the Friendly islands, to which they are much inferior in point of failing. As the Caledonians are a warlike people, they are furnished with a variety of offensive weapons, as clubs, spears, darts, and flings for throwing stones. Most of these islanders are armed with spears and clubs, and carry at their waist a little bag full of stones, cut into an oval shape, which they throw with slings. Their clubs are of different forms; and, as well as their darts and spears, are curiously carved, neatly constructed, and highly polished. Their javelins, which are commonly 15 feet long, are not more than 3/4 inches in circumference at the middle. They are peculiarly dextrous in their mode of throwing them, and of accelerating their motion. For this purpose they employ a very elastic cord, made of the covering of the cocoa-nut and fish-skin, one extremity of which they fix to the end of the forefinger, and the other which terminates in a foot of round button, is twitted round the end of the dart, but in such a manner as to quit its hold as soon as that weapon is thrown into the air. It is somewhat surprising that they are unacquainted with the use of bows and arrows. Their language is different from that of the Friendly islands, though some of their terms resemble those used by the inhabitants of the other islands. D'Entrecasteaux has annexed a vocabulary of their language. Their vocal music, however agreeable to themselves, is harsh and discordant to the ears of Europeans. The only musical instrument which they seem to possess, is a kind of whistle, formed of a little polished piece of brown wood about two inches long, shaped somewhat like a bell, suspended with a rope fixed at the small end; it has two holes near the base, and another near the infection of the rope, all which communicate with one another; by blowing in the uppermost, a shrill sound, like whistling, is produced. These islanders are fond of victuals on naiis and hatchets than any other inhabitants of the South seas islands. They appeared, however, to be acquainted with iron, for they had a term for expressing it; but as they used hard stones for purposes to which iron instruments might be applied, this metal was left important to them than to some of the other islanders. The variation of the needle in this island was 9° 30' towards the east. The mercury in the barometer never rose above 28 inches, 2 lines, and 2-10ths, and never fell below 28 inches, 1 line, and 4-10ths. Notwithstanding the excessive heat which the French voyagers felt on the coast, Reaumur's thermometer never exceeded 25°, and on board never rose above 21°. The tides were not observable above once a day; the flood taking place at half past six, and the ebb rising in perpendicular height, 4 feet 7 inches. The government and religion of the Caledonians nothing is known. Labillardiere's Voyage in search of La Perouse.

CALEDONICA, in Ornithology, a species of Aedea, called by Latham the Caledonian night heron, from its being a native of New Caledonia. The general colour of the plumage is ferruginous, and beneath white; crest on the hind head of three feathers; frontlet black; eye-brows white.

Obf. This bird is an inhabitant of various parts of the Australasian regions as well as New Caledonia. Its length is 22 inches; bill black; area of the eyes green; legs yellow.

CALEFACTIUM, in Medicine, are those substances which, when taken internally, increase the temperature of the body, or produce a febrifation of local or general warmth. In the language of the present day, they are distinguished cordials or stimulants. They may produce a febrifation of warmth by their immediate impression on the nerves, without any actual increase of temperature; but they also tend to accelerate the circulation, and therefore to augment the actual heat. For it has been ascertained that the animal temperature is generated by the chemical changes which take place in the blood in the course of circulation, in consequence of the absorption and evaporation of different gaseous fluids. Whenever, therefore, the rapidity of the circulation at large is increased by general stimulants; or the vessels of any particular part are, by a local stimulus, excited to greater action, and transmit a larger proportion of blood; the evolition of heat will necessarily be augmented; there will be a febrifation of warmth in the general system, or in the particular parts respectively. See Stimulant and Caridac.

CALEFACTION, denotes the production of heat in a body by the action of fire; or the impulse which the particles of a hot body imparts to other bodies around it.

The word is particularly used in pharmacy; where calefaction is distinguished from coction: the first being applied where the thing is only heated, without boiling.

CALETTA, or CALLELLA, in Geography, a fishing village of Catalonia in Spain, 3 leagues from Matara. Its population consists of 886 persons, and it employs near 50 fishing-boats.

CALEMUT. See Salamanie.

CALEMBURG, a principality of Germany, in the circle of Lower Saxony, which takes its name from an ancient castle, now in ruins, situated on the Leine, about 11 miles S. from Hanover. Calenberg is divided into two parts by a portion of the principality of Wolfenbuttel; of which the northern part is surrounded by the principality of Luneburg, the diocese of Hildesheim, the principality of Wolfenbuttel, the counties of Pyrmont, Lippe, Schauenberg, and Hoya, and the principality of Minden; and the southern part by the principalties of Wolfenbuttel and Grubenhagen, and the territories of Eichsfeld and Lower Hesse. This principality constitutes a part of the duchy of Brunswick, and is chiefly formed of counties, lordships, and ecclesiastical states. The country is in some parts mountainous, in some marshy, and in others sandy, but generally fertile; producing wheat, rye, barley, oats, lentils, peas, beans, vetches, buck-wheat, excellent garden-Ruff, tobacco, hops, flax, and plenty of good fruit.
fruit. It has likewise forests of oak, beech, alder, pine, birch, &c. which afford timber for the building of ships and houses, and also wood for fuel and other uses. It also supplies large breeds of horses, black cattle, and sheep, together with venison and fish. In several places are mail-pits, quarries of freestone, and mill-stones, with brick-kilns, turf and coal-pits, rich iron ore, and salt springs. It has also numerous manufactories of woollen and linen, cotton and silk, oil-skins and carpets, leather and paper, and stone ware, both for home consumption and for exportation. Its foreign trade is greatly facilitated by means of the Weser, and the country where the Leine has been rendered navigable. In this principality are 19 cities, the principal of which are Hanover and Gottingen, 17 market-towns, 27 Lutheran parochial churches, 5 Calvinistic, 2 Catholic, 2 Lutheran abbies, one Catholic monastery, 5 Lutheran convents for ladies, and 24,700 taxable hectares. Several of the cities possess both the civil and criminal jurisdiction, but in these appeals lie from the magistrate to the upper courts of justice. The other cities are entirely dependent on the bailiwick. The flates of the country are composed of the prelates and nobility, which are divided into three departments: viz. theofe of Hanover, Gottingen, and HanneH, with the department of Lavenau. These flates have their synods and other officers, but of the nobility of each department two provincial deputies are elected. This principality has a vote both in the imperial college of princes and in the diets of Lower Saxony. Its material allusion is 22 1/2 horse and 140 foot; or 686 florins. All the rivers in this principality discharge themselves either into the Leine or the Weser.

The bailiwick of Calenberg is 4 German miles in length, and 3 broad, extending as far as Hanover. The culture of grain and flax is the principal occupation of the inhabitants. In the whole bailiwick are one town, viz. Gehren and 60 villages.

CALENDAR. Calendarum, or Calendar, a distribution of time, accommodated to the uses of life; or a table, or almanac, containing the order of days, weeks, months, feasts, &c. happening throughout the year. See Almanac, Time, Month, Year, &c. It is called calendar from the word calendar, anciently wrote in large characters at the head of each month. See Calends.

The days in calendars were originally divided into octo-ades, or eighties; but afterwards, in imitation of the Jews, into hebdomades, or sevens; which custom, Sculiger observes, was not introduced among the Romans till after the time of Theodosius.

There are divers calendars, according to the different forms of the year, and distributions of time, established in different countries. Hence the Roman, the Jewish, the Persian, the Julian, the Gregorian, &c. calendars.

The ancient Roman calendar is given by Ricciulius, Struvius, Danet, and others; by which we see the order and number of the Roman holy-days, and work-days.

The three Christian calendars are given by Wolfius in his Elements of Chronology.

The Jewish calendar was fixed by rabbis Hillel, about the year 376, from which time the days of their year may be reduced to those of the Julian calendar.

Calendar, the Romans, owed its origin to Romulus; but it has undergone various reformations since his time. That legislator distributed time into several periods, for the use of the people under his command: but as he was much better versed in matters of war than of astronomy, he only divided the year into ten months, making it begin in the spring, on the 1st of March: imagining the sun made his course through all the seasons in three hundred and four days. According to Plutarch, (in Numa,) these months had no certain or equal number of days, some consisting of 29, some of 35, and some of more. But Macrobius informs us, (Sat. I. c. 12.) that Romulus settled the number of days with greater equality, alloting to March, May, Quintilis, and October, 31 days; and to April, June, Sextilis, September, November, and December, 30; making up in all 364 days. From a passage in Plutarch, (ubi supra,) it appears, that two intercalary months were added to every year; for he says, that the Latins, not understanding the difference between the solar and lunar year, nevertheless provided, that the year should contain 360 days. But these intercalary months were not inflected in the calendar. To these no names were affixed until the succeeding reign.

The calendar of Romulus was reformed by Numa, who, at first, intended to make a complete lunar year of 354 days. With this view, he added 30 days to the 304, which had been divided into 10 months. From every one of the months of 30 days, he borrowed one day, which he added to the 50 already mentioned; of these 56 days he composed two months, calling the one January, and the other February. Not long afterwards, he added one day to January; and thus made his year to consist of 355 days; adding one odd day more than he ought to have done, merely out of superstition, to make the number fortunate. However, he would not allow more than 28 days for February; and, therefore, that month was always accounted unlucky. Moreover, he transferred the beginning of the year from March to January, reckoning March the second, April the third, &c. placing February in the end of the calendar.

(Ovid. Fast. I. ii. v. 47.) In order to adjust the lunar year to the solar, he added 90 days in eight years; because the latter is 114 days greater than the former, and 114 x 8 = 912. Of these 90 days, four months were composed, consisting of 22 and 23 days alternately; and one was intercalated every two years; i.e. to the second year 22 days were added; to the fourth 23 days; to the sixth 22 days; and to the eighth 23 days; in all 90 days. The intercalary month formed of these days was called "Mercedius," or "Meredonius," from the Latin word "merces,"figuing wages, probably, because this time was appointed for the payment of workmen and domestics; and it was inserted after the 23d of February; and the remaining five days of that month were subjoined. By these intercalatums, the quantity of the year became too great; and the excess in eight years amounted to 84 1/8 27/360 nearly. To cut off this excess, it was proposed, in every third centennial period, that is, from 16 to 24 years, to insert not 90, but 60 days, or three months of 22 days, a quantity still too great by 4 28 26; but sufficiently accurate for all the purposes of common life. The year of Numa admitted of no alteration until the year B. C. 457, when the decennalia changed the order of the months, reckoning January the first, February the second, March the third, &c. This arrangement has never been disturbed.

However, the intercalations above mentioned being ill observed by the pontiffs, to whom Numa committed the care of them, occasioned great disorders in the constitution of the year, which Julius Caesar, with the advice and assent of Sofogenes, a celebrated mathematician of Alexandria in Egypt, undertook to rectify. A. U. C. 758. B. C. 46. He found that the months had considerably receded from the seasons to which they had been adjusted by Numa, and that the diæmension of time in the calendar could never be settled on any sure footing, without having regard to the annual course of the sun. In order to bring forward the months
months to their proper places, he took into the account 90
days which had been lost by the former method of reckon-
ing, and formed a year of 15 months, or 445 days, which,
on account of its quantity and design, has been called "the
year of confusion." This year terminated, and the Julian
year commenced on the 1st of January, B.C. 46. From
this epoch, the civil year and months were regulated by the
course of the sun. The year of Numa being 10 days shorter
than the solar year, two days were added by Julius Cæsar
to each of the months of January, August, and December, and
to April, June, September, and November. More-
over, as the annual revolution of the sun is completed in
365 days, and about six hours, he made the year to consist
of 365 days for three years successively, and every fourth
year, of 366, in order to comprehend the odd six hours.
Accordingly, he ordained, that an intercalary day should
be added every fourth year, to the 23d of February; that
is, the 24th day, or fifth of the calend of March, was to
be twice reckoned; and hence this year was called Bissexti-
til, which feé. It is also styled "Leap-year," from its
leaping a day more than that year, in a common year.
Hence it appears, that the Roman, called also the Julian
Calendar, from its reformer Julius, is disposed into quadri-
ennial periods; of which the first three years, which he
called communes or common, consist of 365 days; and the
fourth Bissextile.

The regulations which Julius Cæsar had established were
misapplied by those who had the direction of the calendar.
They intercalated every third, instead of every fourth year;
so that, in the interval of 36 years, three days more than
the due number were inserted. This error, however, was soon
perceived. For the correction of it, Augustus ordained,
that the intercalations should be omitted in the following
years; viz. in the 41st, 45th, and 49th of the Julian era.
This form of the year, thus corrected, was adopted in Italy,
and in several other provinces of the Roman empire. By
some nations, the lunar year was retained, and the days and
months were reckoned by the course of the moon. Modern
chronologers have used the Julian year, being a measure of
time extremely simple, and sufficiently accurate: and to
this standard they refer all events that have happened from
the beginning of the world.

The Julian year, however, though admirably adapted to
common use, was still imperfect: for as the time in which
the sun performs his annual revolution is not exactly 365
days six hours, but 365 days five hours, 48 minutes, and
45 1/4 seconds, the civil year must therefore have exceeded
the solar year by 11 minutes, 14 1/4 seconds; which, in the space
of about 130 years, amounted to a whole day; and, confe-
quently, in 47450 years the beginning of the year would
have advanced forwards through all the feasons; and in
half this interval of time, the summer solstice according to
the calendar, would have fallen in the midst of winter, and
the earth have been covered with frost, when the bloom of
vegetation was expected. It cannot be imagined that So-
figenes was totally unacquainted with this error: though he
probably thought it much smaller than it is, and therefore
neglected it. Among the first of those who discovered the
imperfections of the Julian calendar, were the venerable
Bedo, about the year 730, Johannes de Sacro Boteo, about
1233, and Friar Bacon, about 1255. These great men
had observed, that the true equinox preceded the civil one
by about a day in 130 years. Sofigenes, in the reign of
Julius Cæsar, had observed the vernal equinox on the 25th
day of March. At the council of Nice, held in 325, it was
fixed on the 21st of March; and from that time to the year
1582, when the next reformation was effected, the error,
accumulated by this means, amounted to about 10 days; so
that the vernal equinox was now found to happen on the
15th of March, instead of the 21st, as it ought to have
been in 1582, if the Julian account had agreed with the course
of the sun. This manifest anticipation of the equinox, which,
in the course of more than a thousand years, had become
too considerable not to be noticed, was first proposed to
the councils of Constantine and Latran by two cardinals,
Petrus ab Aliaco, and Cusa, who showed the cause of the
error, and the means of correcting it. In the year 1474,
oppe Sixtus IV. being convinced of the necessity of a refor-
mation, sent for Regiomontanus, a celebrated mathe-
matian, of that period, to Rome, and presented him to the
archbishopric of Ratibon, in order to engage him in this
undertaking. But a premature death preventing his assis-
tance, and no one being thought worthy to be his successor,
the project was, for that time, suspended. Although the
necessity of some alteration was acknowledged, it was after
the lapse of 100 years that pope Gregory XIII. had
the honour of accomplishing what several preceding pontiffs
and councils had attempted in vain. He invited to Rome a con-
siderable number of mathematicians and astronomers,
employed 10 years in the examination of their several formulæ,
and, finally, gave the preference to the plan proposed by
Alofius and Antonius Lilius, two brethren of Verona.
He transmitted copies of this plan, A.D. 1577, to all cat-
tholic states, academies, &c. A council of the most learned
prelates was convened by the pope, and the subject being
finally settled, a brief was published in the month of March,
A.D. 1582, by which the use of the ancient calendar was
entirely abrogated, and the new one substituted in its stead,
called, from the pope’s name, the Gregorian Calendar,
or New Style.

The first object of the reformers was to correct the errors
of the former method of reckoning, and to make the
length of the year agree more exactly with the course of
the sun. For this purpose it was agreed, that the 10 days
which had been gained by the old account, should be
taken from the month of October of the year then cur-
rent, and the equinox brought back to the 21st of March,
as it had been settled by the council of Nice. And, in
order to prevent the future recurrence of a similar variation,
it was ordered, that, instead of making every hundredth year
a Bissextile, as was the case in the former method, every
four-hundredth year only should be considered as a Bissextile,
and the rest be reckoned as common years. The length of
the solar year, and the time of the vernal equinox, were
by these means very accurately settled; for as a day was
saved by the former method of reckoning, in every interval of
130 years, this was nearly equivalent to a gain of three days
in every interval of 400 years; and, consequently, by mak-
ing the years 1700, 1800, and 1900, to be common years,
instead of leap-years, the error arising from the odd time
would be properly corrected. The great difficulty, how-
ever, consisted in making the lunar year agree with the
solar one, and in settling the true time for the observance
of Easter and other movable feasts, which had been subjec-
to no fixed rule. It had been ordered by the Council of
Nice, that Easter should be celebrated upon the first Sun-
day, after the first full moon, following the vernal equinox.
And in order to the due observance of this rule, it became
necessary to know the days when the full moons would hap-
pen, in the course of every year. But this knowledge
was not easily obtained; for the period of Meton, which made
19 years exactly equal to 235 lunations, or revolutions
of the moon, was found to be too long by about one hour
and thirty-two minutes; and, consequently, after 16 of these
periods
periods, the true phases of the moon would precede those
shown by the calendar, by more than a whole day. At
the time when the Gregorian Calendar was first intro-
duced, the error thus occasioned amounted to four days; and
if the old method of computation had continued, the ca-
dendar, in time, would have announced the full moon at
the time of the change, and Easter would have been celebrated
at a period directly opposite to that established by the
church. It was necessary, therefore, to devise some method
for correcting these errors; and Lilius was so fortunate as to
discover, that the 19 years or cycle of Meton had a partic-
ular property, which would render it subservient to the
purposes required. The new and full moons, which, ac-
tording to Meton, were imagined to happen at the same time
precisely as they had occurred 19 years before, were in-
formatively indicated in the following manner: they observed on
what day of each calendar month the new moon fell in
each year of this period, and against those days they placed
the number answering to that year, reckoning from 1 to 19,
through all the years of the cycle. These numbers were
called "Primes" or, "Golden Numbers" (which see); but
as Lilius found them to be erroneous and inconvenient, he
rejected them from his system, and made use of others, called
"Epacts," in their stead. See Epact. These epacts,
being placed against the days of the month in the calendar,
on which the new moons fell in each year, would have an-
twiced the same purpose with the golden numbers; and if
the Metonic cycle had been complete, the form would have
required no alteration: but this is not the case, for after
about 16 of these periods, or 300 years, the new moons
arriving sooner by 24 hours, would happen on the preced-
ing day; and, therefore, the epacts answering to those new
moons ought to be augmented by unity. For, supposing
that the second year of the lunar cycle had 11 for the epact,
then, because the new moon, in the preceding year, arrived
11 days before the end of December, after 300 years, the
same new moon, of the first year of the cycle, would arrive
12 days before the end of the year; and, consequently, the
second year ought now to have 12 for the epact. This
number 12, therefore, will be the index of the new moons
in that second year; and it is easy to perceive, that all
the new moons which happen sooner by a day will take
place upon the day preceding that which in the former
period was marked 11. After 300 years more, the epact
will be 13, which will be a day still preceding that in the
latter period; and the same will happen with all the other
epacts of the cycle. It was this kind of analysis that sug-
gested to Lilius the idea of placing the epacts in their natural
order against the days of the new moons in every year, for
the first 300 years; and after that period, to place them in
the order 1, 12, 23, 4, 15, 26, 7, 18, 29, 10, &c. instead
of the former one; and so on.

This arrangement was simple and ingenious; but the
omission of 3 days in every 400 years was a circumstance
which occasioned some embarrassment. These years having
a day less than in the Julian account, the new moons would
happen a day later, and, consequently, the epact, at the
end of the year, must be diminished accordingly. But as
this order is only interrupted once in 100 years, Lilius ima-
gined, that by subtracting unity from each of the epacts
belonging to those new moons, they might be made to
serve for the subflequent century. And as there are only
30 possible series of these numbers, it was sufficient to
hew by a table, what series belonged to every century, by
which the times of the new moons might be readily discovered.

When pope Gregory had reformed the calendar in the man-
ner above stated, he ordered all the ecclesiastics under his jurif-
diction to conform to this new method of reckoning, and ex-
ported the Christian princes to adopt it in their dominions.
Accordingly it was immediately introduced into all catholic
countries. In Spain, Portugal, and part of Italy, it was re-
ceived on the same day as at Rome; but it was not admitted in
France until the month of December, when the 10th was
reckoned the 20th day, according to letters patent of king
Henry III. dated the 3d of November preceding. The ca-
tholic states in Germany adopted the Gregorian calendar,
A.D. 1582. But the protestant states at that time refused it.
The reformed religion was in its infancy; the zeal of its pro-
fessors was violent, and their opposition to the pope unbounded.
Whatever bore the appearance of his authority was rejected
as an unwarrantable encroachment upon their newly-acquir-
ed liberties; and though the propriety of the alteration was
acknowledged, it was condemned on account of its origi-
nating with a party so extremely obnoxious to them.
Hence arose a difference of 10 days between the methods
of reckoning afterwards used in Catholic and Protestant
countries. When a billet-doux was suppressed, the difference
amounted to 11 days. This difference between the old and
new style, as the Julian and Gregorian accounts are generally
called, occasioned great confusion in the commercial affairs
of the different states of Europe; and therefore the Gregorian
style was, at length, generally received. The Protestant states
in Germany reformed their calendar in Feb. A. D. 1700.
The new style was introduced into Denmark about the same
time; and into Sweden, March 1753. In Great Britain the
inconvenience arising from these two modes of reckoning was
much felt, and several attempts were made to introduce the
reformed calendar. But popular prejudices were for a long
time too obstinate to be easily overcome. The mathema-
ticians, indeed, more influenced by scientific considerations
than by views about points of religion, incessantly urged
the necessity of some correction, and proposed various
methods of effecting it, which might be adopted without in-
flaming the minds of the multitude. Among others it was
proposed, that an act should be passed, declaring that there
should be no leap-year for 40 years to come, by which means,
the 10 days that had been gained by the old ac-
count would have been imperceptibly lost, and the old
style reduced to the new, without any sensible variation in
the fixed times of feasts and other observances. A pro-
aposal of this kind was sent to Dr. Wallis, professor of geo-
metry at Oxford, for his opinion; but the doctor, with a
degree of prejudice altogether inconsistent with his ex-
clusive erudition, observed, that the proposal was specious
enough in appearance; but that the hand of J ab might be
perceived in it. He imagined it to have originated with the
papists; and though he acknowledged the propriety of it,
he was afraid of its being adopted, lest it should open the
door to further encroachments. But though all propos-
als were at that time rejected, those who wished for a re-
formation still renewed their applications; and in 1752, an
act of parliament, after much debate, was obtained for this
purpose. As 170 years had elapsed since the Gregorian
alteration took place, the old style had consequently gained
above a day more upon the course of the sun than it had at
that time: it was therefore enacted, that, instead of cancel-
ing 10 days, as the Pope had done, 11 days should be left
out of the month of September; and, accordingly, on the
2d day of that month, the old style ceased, and the next
day, instead of being the third, was called the 14th. See
Style. By the same act, the beginning of the year was
changed from the 25th of March to the 1st of January.
Russia is the only civilized state of Europe that now retains
the old style.

5 D 2
CALENDAR.

Calendar, Julian Christian, is that wherein the days of the week are determined by the letters A, B, C, D, E, F, G, by means of the solar cycle; and the new and full moons, especially the pashal full moon, with the feast of Easter, and the movable feasts depending thereon, by means of golden numbers, rightly disposed through the Julian year. See the preceding article. See also Cycles, and Golden Number.

Calendar, Gregorian, is that which, by means of epacts, rightly disposed through the several months, determines the new and full moons, and the time of Easter, with the movable feasts depending thereon, in the Gregorian year. The Gregorian calendar, therefore, differs from the Julian, both in the form of the year, and in that epacts are substituted in lieu of golden numbers; for the use and disposition whereof, see Epact.

Though the Gregorian calendar be preferable to the Julian, yet it is not without its defects (perhaps, as Tycho Brahe and Cavallini imagine, it is impossible ever to bring the thing to a perfect fulfillment). For, first, the Gregorian intercalation does not hinder but that the equinox sometimes succeeds the 21st of March, as far as the 23d; and sometimes anticipates it, falling on the 19th; and the full moon, which falls on the 20th of March, is sometimes the pashal; yet not so accounted by the Gregorians. On the other hand, the Gregorians account the full moon of the 22d of March the pashal; which yet, falling before the equinox, is not pashal. In the first case, therefore, Easter is celebrated in an irregular month; in the latter, there are two Easters in the same ecclesiastical year. In like manner, the cyclical computation being founded on mean full moons, which yet may precede or follow the true ones by some hours, the pashal full moon may fall on Saturday, which yet is referred by the cycle to Sunday; whereas, in the first case, Easter is celebrated eight days later than it should be; in the other, it is celebrated on the very day of the full moon, with the Jews and Quoddecimian heretics, contrary to the decree of the council of Nice. Mazlin, Vida, Scaliger, Calvins, and other mathematicians, flae others faults in the Gregorian calendar, arising from the negligence and inadvertency of the authors.

Clavius, to whom the conduct of this business was assigned, after the death of Lilias, composed in 1603 a large work in vindication of it, and successfully combated its adversaries. Defects, it is acknowledged, are to be found in this calendar; but the reformers deserve praise for what they actually did, in an undertaking which does not admit of perfection. Dr. Playfair, in his "System of Chronology," p. 19, observes, that the method of interpolation used in the Gregorian calendar is not the most accurate. Nine, seven days, or 500, are intercalated in the space of four centuries. This supposes the tropical year to consist of 365$1/4$, 5 days. On this supposition, the interpolation would be exact, and the error would scarcely exceed one day in 268,500 years. But the reformers of the calendar made use of the Copernican year of 365$1/4$, 5 days. Indeed, therefore, of intercalating 97 days in 100 years, they ought to have added, at proper intervals, 41 days in 169 years, or 90 days in 371 years, or 131 in 540 years, &c.

Recent observations have determined the quantity of the tropical year to be 365$1/4$, 6, 48, 43. Admitting this to be the true quantity of it, the intercalations ought to be made as follows:

\[
\begin{array}{cccccccc}
+ & + & - & + & + & + & + & + \\
1185 & 1133 & 1441 & 2754 & 4607 & 9447 & 5162 & \\
\end{array}
\]

\[
= \frac{267}{365} \times 14715 + \frac{1}{4583} \times 172800
\]

that is, one day ought to be intercalated in the space of 4 years, or rather 4 days in 17 years, or 8 days in 33 years, &c. If 141,581 days were intercalated in 172,800 years, there would be no error. The figures + and - indicate, that the number of intercalary days above which they are placed is too great or too small. Every succeeding number is more accurate than that which goes before. As this method of interpolation is different from that now in use, it is obvious that the Gregorian calendar must be corrected after a certain period of years. The correction, however, will be inconsiderable for many ages, as it will amount only to a day and a half, which is to be suppressed in the space of 500 years.

Calendar, reformed, or corrected, is that which, setting aside all apparatus of golden numbers, epacts, and dominical letters, retrenches 11 days from the calendar, and determines the equinox, with the pashal full moon, and the movable feasts depending thereon, by astronomical computation, according to the Rudolphine tables of Kepler, agreeably to the first council of Nice. The person who projected this plan was Erhard Weigel.

Upon the death of Weigel in 1699, the project was submitted by the diet to the consideration of Sturmius, professor of mathematics at Altdorf; Hambenger, professor at Jenae; and Meyer, professor at Ratibon. In consequence of their report, this calendar was introduced among the Protestant states of Germany, in the year 1705, when 11 days were at once thrown out of the month of February; so that in 1700, February had but 18 days; by this means the corrected style agrees with the Gregorian. This alteration in the form of the year they admitted for a time, in expectation that the real quantity of the tropical year being at length more accurately determined by observation, the Romanists would agree with them on some more convenient intercalation.

Calendar, French or Republican. Soon after the government was changed in France, it was decreed on the 2d of January 1792, that this year should be denominated the fourth of liberty on their coins, and in their acts. After the death of Louis XVI. in 1793, it was determined that this year should be called the first of the republic, and this suggested the idea of a republican calendar. Accordingly, on the 12th of January, 1793, the deputy Romme, president of the committee of public instruction under the convention, applied to the Academy of Sciences for a commission to deliberate on this subject; but M. de la Lande protested against the change of the calendar. He was obliged, however, to acquiesce, and to prepare a new calendar. After the example of the Egyptians, he preferred 12 equal months, with five intercalary days, and he adapted their denominations to the climate of Paris, which Fabre d'Églantine expressed by the following terms, viz. Vendémiaires, or vintage month; Brumaire, or foggy month; Frimaire, or frosty month; Nivose, or snowy month; Pluviôse, or rainy month; Ventôse, or windy month; Germinal, or budding month; Floréal, or flowery month; Prairial, or meadow month; Messidor, or harvest month; Thermidor, or hot month; and Fructidor, or fruit month. The first month begins September 23; the second, October 23; the third, November 22; the fourth, December 23; the fifth, January 21; the sixth, February 20; the seventh, March 22; the
the eight, April 21; the ninth, May 21; the truth, June 20; the eleventh, July 20, and the twelfth, August 19; making in all 360 days. The remaining five days are called the complementary days; of which the first is the 18th of September; the second, the 19th; the third, the 20th; the fourth, the 21st; and the fifth, the 22d of September, being the last day of the French year.

The first decree was issued the 5th of October 1793; and it was followed by another on the 21st of November, or the 4th of Frimaire, in the second year of the republic, settling the commencement and organization of the year, and the names of the days and months. The decree of the national convention comprehends four articles, viz. That the French era should be reckoned from the foundation of the republic, September 22, 1792, of the vulgar era, on the day when the sun arrived at the true autumnal equinox, in his entrance into the sign Libra, at 9° 18' 30" in the morning, according to the observatory at Paris: that the vulgar year should be subsided in all civil concerns: that each year should commence at midnight with the day on which the true autumnal equinox falls, according to the observatory at Paris: and that the first year of the French republic had actually commenced at midnight of the 22d of September, 1792, and terminated at midnight, between the 21st and 22d of September, 1793. The decree for adopting a rule of intercalation, in order to preserve the feasons at the same epochs of the year, comprises the following four articles: viz. that the fourth year of the republican era should be the fifth fastile; that it should receive a fifth complement day; and that it should terminate the first franciate: that the fastile, or leap years, should succeed one another every four years, and mark the end of each franciate: that the four following secular years in succession should be excepted from the fastile article; namely, the fifth, seventh, and third secular years 100, 200, 300, which should be common: and that the fourth should be fastile: and that this should be the case every four centuries until the 40th, which should close with a common year, the year 4000.

In this new calendar or almanac, the months consist of 30 days each, and are divided into three decades. The days of each decade are known by the names of Primi, Secundi, Tertiis, Quartih, Quinti, Sexi, Septim, Octavi, Novem, and Decem. The day, which begins at midnight, is distributed into ten parts, and these are decimally divided and subdivided. To the five supernumerary days in common years, and six in leap years, was applied the absurd appellation of Sans Calendrier, borrowed from a term of reproach (Sans Culotte), which had been originally bestowed on the republican party, on account of the meagre of their rank and fortune; but which the same party afterwards attempted to render honourable and popular; and this appellation also serves to distinguish the leap years.

b signifies biannual, or leap-year—4 sexaxile, or French leap-year—a common year of 355 days—m morning—a afternoon.

The French decree does not determine the proper rule for fixing the leap-year: the necessity for determining this rule will happen in 1811. The most convenient method appears to be the common one, when after 7 Franciates of 4 years, a Franciate of 5 years occurs: according to this regulation, the 5th and 15th Franciates are of 5 years each. The Bureau des Longitudes will doubtless avert this point with more accuracy.

### TABLE II.
**Calendar.** Persian is founded on the Persian era, called "Yezdegerd," or "Jezdegerd," which derives its name from the last king of the race of Sassanians, or 5th dynasty, that reigned in Persia. Some suppose the ancient Persian era to have been established by Gemshid, one of the Pithodian kings, about 800 B.C. On the day when the sun entered Aries, he is said to have made his public entry into Persepolis, which he had just finished, and to have ordained the era to commence from that time, in honour of the sun, and in commemoration of the building of his capital city. He divided the year into 12 months of 30 days each; to the last of which 5 supplementary days were added. But no attention was bestowed on the odd quarter of a day, till astronomers, in the reign of Yezdegerd, observing that the beginning of the year had moved in a retrograde direction from Aries to Pisces, corrected this error, and appointed one month to be inserted at the end of every 120 years, and the intercalary month of 30 days restored the integrity of the solar year. By this reformation of the calendar a new era was produced, which is still adopted in many parts of Persia. All, however, do not agree in the epoch of its commencement. Some refer the date of it to the beginning of Yezdegerd's reign, which they place on the 16th of June, in the 11th year of the Hegira, A.D. 1032. Of this opinion are Ulugh Begh and Herbelot (Bib. Orient.) Others compute from the time of his defeat by the Arabs at Cadiz, A.D. 636. Some few reckon from his death, A.D. 651 or 625, among whom are Alfaragianus, Scaliger, &c. The best modern chronologists have adopted the first of these opinions, which is most conformable to the testimony of the eastern writers.

In vindication of which it may be observed, that Yezdegerd had lived as a private person, as his father had always done, till the Persians, understanding how just a title he had to the kingdom, set him upon the throne. The Arabs say, this was done with the consent of their caliph, who therefore regarded him as his tributary, reckoning the kingdom of Persia among the rest of his dominions from this time, and considering the subsequent reduction of that country not as a conquest, but as the re-union of that part of his empire which had been severed from it by a rebel. This is plainly the cause why the commencement of this era is and ought to be fixed at the accession of Yezdegerd. The years of this era are Naboffarean; for each year consists of 365 days, or 30 months of 30 days each, with the addition of 5 intercalary days to the month Aban, or to the end of the year.

Besides this form of the year, Persian astronomers use the Gelalean year, so called on account of the title "Gelaleddin," which was conferred on Malekshah, sultan of Khorasm. This great prince, A.D. 1074, assembled the most celebrated astronomers of his time, in order to reform the calendar, which he found imperfect, to ascertain the vernal equinox for astronomical purposes, and for the regulation of their solemn festival "Nuruz," or new-day, and to change the order of the months, under the idea of restoring the ancient mode fixed by Gemshid. The year, as he reformed it, was twofold, civil and astronomical. He fixed the beginning of both on the 14th of March, the feast of the equinox, A.D. 1074, or, according to Zacuti, a Jewish author, A.D. 1079. In the correction of the civil year, besides five intercalary days, in every fourth year he added, six or seven times in succession, a sixth day; after which the intercalation was not to occur more frequently than once in five years. The Persian astronomical year was of the same form, and nearly of the same quantity with the solar tropical year; for it consisted of 365.5, 49.53°. From these frequent reformations of the Persian calendar, there has arisen no small disagreement among different writers with regard to the feasts and

When a Gregorian leap-year occurs, one day must be subtracted from all those days in the year which are marked with asterisks.
and days when several festivals were to be celebrated, which it would be difficult to reconcile. Playfair's Chronology, p. 55. See EPOCH AND YEAR.

Calendar, construction of a, or almanac. See Almanac.

Calendar is also applied to divers other compositions respecting the twelve months of the year.

In this sense, Spencer has given the shepherd's calendar, Evelyn and Miller the gardener's calendar, &c.

Calendar is used for the catalogue, or rati, anciently kept in each church, of the saints, both universal, and those particularly honoured in each church; with their bishops, martyrs, &c. Calendars are not to be confounded with martyrologies, for each church had its peculiar calendar; whereas the martyrologies regarded the whole church in general; containing the martyrs and confessors of all the churches. From all the several calendars were formed one martyrology; so that martyrologies are posterior to calendars. See Martyrology.

Calendar is also extended to an orderly table, or enumeration of persons or things. Lord Bacon wishes for a calendar of doubts. A late writer has given a calendar of the persons who may inherit estates in fee-simple.

Calendar montis, the solar months as they stand in the calendar, viz. January 31 days, &c.

The number of days in each month may be suggested to the memory by the following canon:

"Thirty days hath September,
April, June, and November,
February has twenty-eight alone,
And all the rest have thirty-one."

Calendar, astronomicus, an instrument engraved upon copper-plates printed upon paper, and pasted on board, with a brass slider which carries a hair, and shews by inspection the sun's meridian altitude, right ascension, declination, rising, setting, amplitude, &c. to a greater exactness than our common globes will shew.

Calendar of prisoners, is a list of all their names, with their separate judgments in the margin, which the judge signs, and the execution of which is committed to the respective sheriffs. In the case of a capital felony, the words "hang by the neck" are annexed to the prisoner's name, instead of "ful. per col." for suspendatur per collum, which was the ancient form. Judge Blackstone well observes, that the execution of a man seems to be too important and terrible a fact to depend on a marginal note. Blackst. Com. vol. iv. p. 396.

Calendar-globe, vitrum calendare, a name formerly given by some writers to a thermometer, or graduated tube, whereby to measure the degrees of heat.

Calendar-brothers, frateres calendari, a sort of devout fraternity, composed of ecclesiastics as well as laity; whose chief buisness was to procure masses to be said, and alms distributed, for the souls of such members as were deceased. They were also denominated calendar-brothers, because they usually met on the calendars of each month, though in some places only once a quarter.

CALENDARIO, Philip, in Biography, a celebrated architect and sculptor, flourished at Venice in the time of Martin Falerti, doge of that republic in 1354. He constructed those beautiful porticoes supported by marble columns, which surround the place of St. Mark, above which are seen superb buildings ornamented with bas reliefs and rich paintings. By these works he established both his fame and fortune. Mureri.

CALENDARIUM quintum. The Christians retained much of the ceremony and wantonness of the calendars of January, which for many ages was held a feast, and celebrated by the clergy with great indecencies, under the names quintum kalendariurn, or hypodietonorum, or flitorum, that is, the feast of fools; sometimes also libertas decemviri. The people met masked in the church, and in a ludicrous way proceeded to the election of a mock pope, or bishop, who exercised a jurisdiction over them suitable to the festivity of the occasion: fathers, councils, and popes long laboured to refrain this licence, to little purpose. We find the feast of the calendars in use as low as the close of the fifteenth century. Du Cange.

CALENDER, a machine used, in the manufacturies, for pressing certain stuffs, silks, callicoees, and even linens; to make them smooth, even, and glossy. It is also used for watering, or giving the waves to tabbies and mohairs.

The word is formed from the French calendre, or Spanish calendra, which signify the same; and which have derive farther from the Latin cylindrus; because the whole effect of the machine depends upon a cylinder. Borel derives the name from that of a little bird, of the swallow kind; on account of the agreement between the feathers of the bird, and the impression of the machine.

The calender consists of two large wooden rollers, round which the pieces of stuff are wound: these are put between two large, close, polished planks of wood, or plates of iron, the lower serving as a fixed base, and the upper moveable, by means of a wheel like that of a crane; with a rope, fastened to a spindile, which makes its axis: this upper part is of a prodigious weight, sometimes twenty or thirty thousand pounds. It is the weight of this part, together with its alternate motion, that gives the polish, and makes the waves on the stuffs, by causing the cylinders on which they are put to roll with great force over the lowest board. The rollers are taken off, and put on again, by inclining the machine.

At Paris they have an extraordinary machine of this kind, called the royal calender, made by order of M. Colbert; the lower table or plank of which is made of a block of smooth marble, and the upper lined at bottom with a plate of polished copper.

This is called the great calender; they have also a small one with two tables of polished iron or steel.

There are also calenders without wheels, which are wrought by a horse harnessed to a wooden bar, which turns a large bar placed upright; at the top of which, on a kind of drum, it wound a rope, the two ends of which being fastened to the two extremities of the upper plank of the engine, give it motion. But the horse calender is in less esteem than the wheel kind, as the motion of this latter is more equable and certain.

We read of calendering worlde. To improve linen farther, the drapers get several sorts of their cloths calendered; whereby their threads are made to lie flatter and smoother.

Calender also denotes the workman who manages the machine above described; applying the cloth or stuff underneath, after having first wound it on the rollers.

Calenders is also the name of a sort of dervises spread through Turkey and Persia, whose order is not in general esteem among the Mahometans, as being reputed lefs abominous and licent in morals than some other orders. They derive their name from Calendria, their founder, who went barcheaded,
bareheaded, without a shirt, and with the skin of a wild beast thrown over his shoulders. Before, he wore a kind of apron, the fringes of which were adorned with counterfoil precious stones. In Persia and Arabia these derivatives were called Allah or Abdal, i.e., Perfons consecrated to the service or honour of God. They preach in the marketplaces, and live upon alms. See Deris.

CALENDS, CALENDAR, in the Roman Chronology, the first day of every month.

The word is formed from sabb., I call, or proclaim; because, before the publication of the Roman Fasti, it was one of the offices of the pontifices to watch the appearance of the new moon, and give notice thereof to the Rex Sacrisficus; upon which a sacrifice being offered, the pontiff summoned the people together in the capital, and there, with a loud voice, proclaimed the number of calendae, or the day whereon the moons would be; which he did by repeating this formula, as often as there were days of calendae: Calo Juno Novella. Whence the name calendae were given thereto, from calo, calare. This is the account given by Varro. Plutarch, and after him Gaza, derive the word from clam; Quia luna calendis clam fiat; but this is far fetched. Others derive the appellation hence; that the people being convened on this day, the pontifex called or proclaimed the several feasts or holidays in the month; a custom which continued no longer than the year of Rome 450, when C. Flavius, the curule ædile, ordered the fasti, or calendar, to be set up in public places, that every body might know the difference of times, and the return of the festivals.

The calends were reckoned backwards, or in a retrograde order; thus, e.g. the first of May being the calendae of May; the last, or thirtieth of April, was the primae calendae, or first of the calendae of May; the twenty-ninth of April, the third of the calendae, or before the calends; and so back to the thirteenth, where the idæ commence; which are, likewise, numbered invertedly to the fifth, where the nones begin; which are numbered after the name manner to the first day of the month, which is the calends of April. See Ides and Nones.

The rules of computation by calends are included in the following verses:

"Prima dies mensis cujusque est dicta calendae: Sex Mnaus Nover, October, June, Mars: Quo naut reliquis habet idus quiblibet octo: In die dies religios omnies dicit ecle calendae; Quas retro numerans dices unum ficiente."

To find the day of the calends answering to any day of the month we are in; see how many days there are yet remaining of the month, and that number add two: for example; suppute it the 22d of April; it is then the 10th of the calends of May. For April contains 30 days; and 22 taken from 30, there remains 8; to which 2 being added, the sum is 10.

The reason of adding two is, because the last day of the month is called secundae calendae, the last but one tertio calendae, &c.

The Roman writers themselves are at a loss for the reason of this absurd and whimsical manner of computing the days of the month; yet it is still kept up in the Roman chancery; and by some authors, out of a vain affection of learning, preferred to the common, more natural, and caly manner.

CALENDS, Calendar, are also used in Church-History to denote confrances anciently held by the clergy of each deanery, on the first day of every month, concerning their duty and conduct, especially in what related to the imposition of penance. Du Cange.

CALENDS of January, in Roman Antiquity, was a solemn festival consecrated to Juno and Janus; wherein the Romans offered vows and sacrifices to those deities, and exchanged presents among themselves, as a token of friendship.

It was only a melancholy day to debtors, who were then obliged to pay their interests, &c. Hence Horace calls it trifles calendae. Lib. i. Serm. Sat. 3.

CALENDULAE, in Botany, (according to Martyn, a diminutive from Caltha, the name of the most common species in old authors; Venentan derives it from Calendar, the Latin term for the first day of every month, because it continues long in flower, whence one of its Italian names Fiore d'ogni Mese.) Linn. gen. 990. Schreb. 1359. Willd. 1559. Curt. 991. Jaff. p. 183. Vent. v. 2. p. 545. Marigold.

Gen. Ch. Calys simple, nearly upright, with numerous linear-lanceolate, nearly equal divisions. Cor. radiate: florst of the disk numerous, tubular, semiquinquefoil, the length of the calyx; the ray strap-shaped, very long, three-toothed, hairy at the base, without nerves, with pistils only. Stamens of the disk: filaments five, capillary, very short; anthers the length of the floriets, united in a hollow cylinder. Petals of the ray: germ oblong, fleshy thread-shaped, feckly the length of the stems; stigma obtuse, bifid, straight. Pistil of the ray: germ oblong, three-cornered; thread-shaped; stigma two, oblong, acuminate, reflexed. Pericarp, the permanent calyx converging and depreessed. Seeds in the centre of the disk none; in the circumference, sometimes but rarely solitary, membranous, inerely heart-shaped, compressed; in the ray, solitary, larger, oblong, incurved, triangular, with membranous angles, marked on the outside longitudinally with the figure of a vegetable. Down none. Recep. naked, flat.

Obf. As the seeds in the circumference of the disk are very different in form from those of the ray, Linnaeus was in doubt whether they were not abortive; but Gärtner affirms that both kinds are fertile.

CAL

yellow, erect; in fruit nodding. **Rinus of the seeds semiorbicularitate.** houses. C. marica, Willd. Thunb. "Leaves oblong, rugged with papillary tubercles; the lower ones toothed, upper ones entire; stem thrubpy." Perennial. 27.- **C. monensis, Willd. Thunb.** "Leaves wedge-shaped, fleshy, toothed." Perennial. The last eight are all natives of the Cape of Good Hope.

**Observation and Colour.**—The seeds of the arvensis, func- tii, chelidonia, pluvialis, hybrids, and radicalis, should be sown in the spring, and will afterwards sow themselves without much trouble. The last three should not be transplanted. The graminifolia does not often produce good seeds in Europe; but is easily propagated by slips taken off from the head, in the same manner as is praefided for thrift. They may be planted any time in summer, in pots filled with light loam earth, and plunged in a moderate hot-bed, or placed in the common earth under a melon frame, and occasionally, but not plentifully watered. When they have taken root, they should be transplanted and kept during the summer in the open air, and in a shady situation. In winter they require protection from frost and heat, but do not thrive in artificial heat. The fructicola is also easily propagated by cuttings in light poor earth, and must be treated in the same manner as the graminifolia.

**Calendula,** in Carkoffia, a species of Motacilla that inhabits North America, the *Ruby crowned" corn of Lithuan. 

*Calendula.* Litt., and calendula penivulae of Buffon. The colour is greenish-yellow; crowned with a ruby, (sometimes deep yellow) line; abdomen and wings beneath yellowish. Gmel. &c.

**This is a small bird. The female has no ruby line on the
crown, but has a scarlet lindle mold commonly on the nape,
which is not observable in the male.

**Calendula,** in Zoolog, according to Gmelin, a fort of **Hydra, called by Hughes in his "Natural History of Barbados," the animal flower. Authors are divided in opinion as to the genus to which this animal-flower ought to be referred. Gmelin expresses a doubt of its being truly of the hydra kind, although he places it in that genus. Ellis con-

**This we have, however, no hesitation in believing it to be
either of the genus hydra, nor actinia, but a species of
tubularia. This we must presume from its analogy to the
tubularia magnifica, and some other accurately defined spe-
cies of that genus. The original figure of this animal is that which appears in the "Natural History of Barbados" by Hughes. Ellis and Solander have a figure of it in their work on zoophytes, but which is copied from the above mentioned publication, as is also the description that accom-

**We must therefore receive to the account
given of it by Hughes, as being the best to be obtained at present of the hydra animal." This writer describes it as having the appearance of fine radiant flowers, of a pale yellow, or bright brown colour, slightly tinged with green; each surrounded by a circular border of thick-flet petals about the size of, and much resembling, those of a single garden marigold; except that the whole of this feaming flower is narrower at the discus, or fettong out of the centre from which he calls the flower, with a quick spontaneous motion from one side to the other of the circular border of leaves (petals); and these in reality, he says, were so many arms or feelers, closing together in imitation of a forceps, as if they had

**hemmed in their prey, which the yellow border soon sur-
rrounded, and closed to secure. He attempted to pluck
one of these from the rock to which they were affixed, but
never could effect his design, for as soon as his fingers came
within two or three inches of it, the animal would immedi-
ately contract its border of tentacula, and shrouck back into
the hole of the rock; but if left undisturbed for about four
minutes, it would come gradually into fight, expanding,
though at first very cautiously, its petals or tentacula, till it
would at length appear again as before, like a flower in full
bloom. As often as his hand came within a certain distance
of it, the animal would again recoil from his approach in
the same manner. He also tried the same experiment by
attempting to touch it with his cane, and a small flounder
red, but the effect produced was the fame.

**Ellis calls this the sea marigold, from its near-resemblance,
when the tentacula are expanded, to the flower of the com-
mon marigold. It may be specifically defined in the words of
Gmelin: Item somewhat turbinate: diff. surrounded by petal-shaped tentacula, or rays.

**CALENS, in Entomology, a Siberian species of Chry-
sis of a large size, described by Fabricius. The prevailing
colour is glossy blue; abdomen golden; tail blue and armed
with four teeth. Off. The legs and tip of the antennae are
fusous.

**CALENS, a species of Cimex found in India. The head,
thorax, and wing-cases are black, with a fulvous feuel.

Gronovius, &c.

**CALENTES, in Logie, a sort of fylliforms in the fourth,
commonly called Calenditad, figure, wherein the major pro-
position is universal and affirmative; and the second or mi-
tor, as well as the conclusion, universal and negative. This
is intimated by the letters it is composed of, where the A
figures an universal affirmative, and the two E's as many
universal negatives. E. gr.

**CA Every affility in this world is only for a time,
LEN No affility, which is only for a time, ought to dis-
urb us.

**TES No affility ought to disturb us, which happens in
this world.**

*The Aristotelians not allowing the fourth figure of syllo-
gisms, turned this word into celantes, and make it only
an indirect mood of the first figure.*

**CALENTUS, Elisius, in Biography, an ingenius
writer both in prose and verse, was born in Apulia, and be-

**came preceptor to prince Frederick, the son of Ferdinand I. king of Naples, whom he endeavoured to insinuate
with sentiments of justice and humanity, congenial to his own.
He was an enemy to capital punishments, and propounded va-
rious subltiles for them in different cafes. He was much
addicted to agriculture, and practiced it with skill. Al-
though his circumstances were narrow, he lived on terms of
intimate friendship with the most eminent felicors of his time,
and was a member of the Neapolitan academy. He was
the author of several works, both in prose and verse,
which were printed in 1593, about the time of his death;
the principal of these was his poem on the "Battle of the
Frongs and Mice," imitated from Homer. He declined
writing the history of the war carried on by Charles the
Bold against the Swis, alleging, that it was not safe to
speak ill of princes, and that an honest man ought not to
publish falsehoods.

**CALENTO, in Ancient Geography, a town of Spain,
on the other side of the Ebrus. Pliny says, that bricks
were made in this place of an earth resembling pumice-stone,
which would not sink in water.**
It was celebrated for its wine, called "Calenum." In its ruins are discovered a theatre and amphitheatre.

**CALIS, in Geography.** See CAISSI.

**CALIPE, or CALITES, in Ancient Geography.** A people placed by Ctesias, and also by Strabo, in Hespise Gaul; but Augustus comprees them in Celtic Gaul, or Galia Lyonnaquis; their chief town was "Julobona." M. de Anville conjectured that they probably occupied the dreece of "Caes." The promonitory "Caletonum," was situated in Lyonnais Secunda, at the mouth of the Seine; now called "Cape Caux."

**CALIPE, in Geography.** See CALITAE.

**CALIPE, in Geography.** See CALIPPE.

**CALIPE, in Geography.** See CALILAE.

**CALIPPE, in Geography.** See CALILAE.
these prepared kinds of food is given night and morning for a few weeks after the calves are put on that diet, but afterwards, only once a day, till they are three months old or more, and become perfectly strong.

The calves in Gloucestershire are not allowed to suck above two or three days; they are then fed on skimmed milk, which is previously heated over the fire. When they arrive at such an age as to be able to eat a little, they are allowed split beans or oats, and cut hay, water being mixed with the milk at the time of giving it.

And the method practised in Suffolk differs materially from any of these. It is common, in that district, to allow the calves either to suck for ten or twelve weeks, or to wean them at the end of three or four, and to give them a liberal allowance of skimmed milk for six or eight weeks longer when necessary. The Suffolk farmers adopt the practice of letting the calves suck the cows a month, six weeks, or more, coarse pollard and oats being then given in mixture with skimmed milk and water: some nice green hay being constantly placed before them, till the period of their being turned out into the pastures. In this method, carrots would probably supply the place of the oats, and greatly lessen the expense.

The method pursued by the farmers in Scotland for rearing calves seems well adapted to the purpose: they are two. The first is, by giving them a pailful, containing about a gallon, of milk, warm from the teat of the cow, morning and evening, for eight or ten weeks. The second, which is certainly the most agreeable to nature, and therefore to be preferred to any other that can be adopted, is, to allow the calf to suck its dam, as is sometimes done in the county of Suffolk, and some other districts, as in some parts of Lancashire.

The Norfolk husbandmen permit their early calves to suck twice in the day for about a fortnight, and afterwards to have the pail in the same manner for an equal length of time; then once a day for a month or more, according to circumstances; tumps, cut hay, &c. being placed in the mangers before them, at the time.

Where it is the custom to rear calves with skim-milk, it should always be boiled, and suffered to stand until it cools to the temperature of that first given by the cow, or in a trilling degree more warm, and in that image given to the calf. Milk is frequently given to calves when warmed only; but that method will not succeed so well as boiling it. If the milk be given over-cool, it will cause the calf to fret or purge. When this is the case, put two or three spoonsful of rennet in the milk, and it will soon stop the looseness. If, on the contrary, the calf is bound, bacon-broth is a very good and safe thing to put into the milk. One gallon, or rather more, of milk per day will keep a calf well till it be thirteen weeks old. A calf may then be supported without milk, by giving it hay, and a little wheat bran, once a day, with about a pint of oats. The oats will be found of great service, as soon as the calf is capable of eating them, in promoting its growth. The bran and oats should be given about mid-day: the milk in equal portions, at eight o'clock in the morning, and four in the afternoon. But whatever hours are chosen to set apart for feeding the calf, it is best to adhere to the particular times, as regularity is of more consequence than is generally suppos’d. If the calf goes but an hour or two beyond its usual time of feeding, it will find itself uneasy, and pine for food.

It is always to be considered, that calves, reared in this manner, are to be enticed to eat hay, or some other familiar material, as early as possible; and the blunt way of doing this, is, to give them the sweetest hay in your possession, and but little at a time. Turnips or potatoes are very good food, as soon as they can eat them; and they are best cut small, and mixed with the hay, oats, bran, and such articles, at the time of their being given.

It may be observed, that it is not absolutely necessary to give milk to calves after they are one month old; and to wean them gradually, two quarts of milk, with the addition of linseed boiled in water to make a gruel, and given together, will answer the purpose, until, by diminishing the milk gradually, the calf will soon do entirely without. Hay- tea will answer the purpose, with the like addition of two quarts of milk, but is not so nutritious as linseed. It is a good method of making this, to put such a proportion of hay as will be necessary into a tub, then to pour on a sufficient quantity of boiling water, covering up the vessel, and letting the water remain long enough to extract the virtues of the hay. When bacon or pork is boiled, it is also a good way to preserve the liquor or broth, and mix it with milk for the calves.

In summer, calves may sometimes be reared on whey only. But when reared in winter, they must be fed with hay; and clover-hay is probably the best of any for this use. Calves may also be raised with porridge of different kinds, without any mixture of milk at all.

It has been suggested to be sometimes a good convenient plan, to bring up calves under a sort of foster mother; an old cow, with a tolerable flock of milk, will fatten two calves, or more, either turned off with her, or at home, keeping them in good condition, until they are old enough to shift for themselves: they ought to be suck the first of their mother’s milk, for two or three days, although many are weaned without ever being suffered to suck at all. Calves, whether rearing or fattening, should always suck before milking, the cow being milked afterwards, as the first and thinnest of the milk is sufficiently rich for them. Old milk often scours very young calves; but the effect generally goes off without any ill consequence. Skimmed milk and second flour are sometimes made use of. The large, short-horned breed of calves mostly confine daily, at three meals, three quarters of a pound of flour each, boiled up in skimmed milk or other liquid.

The proper degree of warmth for the skimmed milk, on which calves are weaned, is a little above that fresh from the cow.

In the Rural Economy of Norfolk, it is remarked, by Mr. Marshall, that some farmers bring up all the year round, rearing every calf they have dropped. Others rear in winter only, fattening their fummer calves for the pea-markets; or at a distance from them for the butcher. Norfolk farmers, in general, begin early in winter to rear their calves, some far earlier than Michaelmas; in common, if their cows come in before Christmas, not only as being fully aware of the advantage of rearing early, but in order that they may rear as many of their own calves as possible, through calves being always hazardous, and sometimes scarce. No dilution is made as to sex; males and females are equally objects of rearing, and are both occasionally subject to castration, it being a prevailing custom to fay all heifers intended to be fattet at three years old, but such as are intended to be further at two years old are, it is believed, prettily generally left "open," as are, of course, such as are intended for the dairy. There are two reasons for this practice; they are prevented from taking the bull too early, and thereby frustrating the main intention; and by this precaution may be more quiet, and are kept from roving at the time of fattening.
This may be one reason why spayed heifers are thought to fatten more kindly at three years old, and to be better fleshed than open heifers. The method of treatment depends, in some measure, on the time of rearing; the winter calves require more milk than the later-dropped ones.

"Here the general treatment of a calf dropt at Christmas may be said to be this: anke twice a day the first fortnight, has the pail twice a day for the next month or six weeks, and once a day for a month or six weeks longer, with hay in a rack and turnips in a manger, and sometimes with oats and beans among the turnips, which last, after a calf has taken freely to them, serve as both meat and drink. In this confits the chief peculiarity of the Norfolk method of rearing calves, which may be said to be with milk and turnips; the last a species of food, which, in every other part of the kingdom is, it is believed, entirely neglected or unthought of. As soon as the weather gets warm enough, the calves are turned out in the day amongst the fattening bullocks, or on to a patch of turnips, or upon a piece of wheat, or a forward grass-piece, and houghed again at night, until the days growing long and the nights warm, and the clover and darnel have risen to a full bite, when they are turned out altogether, and continue to have the first bite of every thing which is good and palatable to them throughout the summer. This may be called the general treatment of calves dropt at Christmas; but the management of no two farmers is exactly the same."

Calves, weaning of: The most suitable season for this busines is the early part of the spring, as such calves as are weaned at a late period seldom attain any great size. The heft means of accomplishing this is by gradually taking them from the cow, and afterwards diminishing the quantity and quality of the milk, or other liquid with which they are fed, until they become capable of being supported on grass alone, or with some sort of cut food. The method of management in these cases is thus stated by the author of the "Synopsis of Husbandry": "having a cow fitted to the purpose which drops a calf, let it be suckled in the usual mode, till it hath completed the third week of its age; when, instead of turning it to the cow, it is to be suckled by thrusting its head into a pail of new milk, and the finger of the person who directs the busines is to supply the place of a teat. At first the calf may be rather awkward at sucking the finger, but this will soon become familiar, and after a while a lock of hay may be substituted for the teat; and as the calf advances in age it will suck the milk out of the pail without any assistance. The milk should at first be given, as observed before, free of adulteration; but, at the end of the first month, a little milk pottage may be added to each serving. This method should be continued till the calf is twelve or fourteen weeks old, lowering the milk pottage by degrees, till at length it will be brought to simple water only. At the season when the calf is thus weaned from the teat, it ought to be turned abroad in the day-time into a small close or orchard near the yard, where there is a good bite of grass, which may be expected at the time of the year when the weaning calves are of this age; and as there will generally be more than one calf weaned in a feaon, they will each be company for the other, and become in a short time reconciled to their situation. It is to be observed, that this pature should be at some distance from that wherento the dams are turned, and that there be neither ponds nor ditches, nor any annoyance which might endanger the lives of these youthful animals; and in order to habituate them—fill more to their pature, the milk-pottage should be carried clean to them at each of their feeding hours. For the first month or six weeks the calves ought every night to be brought out of the meadow and lodged in the pens; but, after this time, they may be left in the pasture as well in the night season as in the day, and at this time their food may be lowered by degrees, till, as was before observed, it be at length reduced to simple water only, for when the calves get to the age of twelve or fourteen weeks, they will no longer require the aid of this sustenance, but will be able to satisfy their appetites by grafs. Care, however, must be taken throughout the summer, that they be frequently shifted from one pature to another, in order that they may be kept up in good flesh, and enabled to grow away with the utmost celerity. At Michaelmas, or soon after, the calves should be taken into the yard; and if they were allowed the indulgence of a small close to themselves, it would be still better. And here their tallow must be gratified with the bolt and sweet salt hay that can be procured, with an outlet on a dry pasture, where in fine open weather they may be suffered to enjoy themselves; and it would redound greatly to their welfare, if, on the approach of winter, a fixed was to be erected for them to repose in during the night, and for shelter in tempestuous days. So essential are warmth and good living to young animals of every denomination, that the care which has been taken of them in their early days will be manifest in every part of their future growth. Nor is there any flock which will pay better for this cautious management in their youth than those of the cow kind: for if they are flitted in their feed, or carelessly attended whilst in their growing stature, they will never arrive to that fize which they would otherwise have done, and consequently the loss will be perpetually felt by the farmer who attempts to raise milch kine of his own breed, without giving them a due attendance in the first year. When the calves have attained their first year, they are called foals, or yearlings; and though at this time they may be able to mix with the herd, yet he thinks it would be most prudent, if not attended with too great an inconvenience, to suffer them to remain in a pature by themselves. But if this cannot be done, let them be turned out with the dry flock, and not permitted to run with the cows, as this might probably be the occasion of their taking bull; a measure which should at this time be cautiously guarded against, as such buds which propagate at this early age will receive a check in their growth on this account; and if, during the succeeding winter, they were to be managed as before directed, he is of opinion that their future growth would be found to pay ample interest for the fodder that is now given them; only this is to be observed, that as their stregnth is now considerably augmented, a less valuable fodder may suffice, and good pea-straw may well supply the place of hay. Such farmers who have low rusty meadows, where there is frequently a length of trill in the winter, may in this second year turn the calves into them, and here they will meet with plenty of nourishing food, whilst the weather is fair and open. At two years old the heifer may be suffered to take bull; but it would in his opinion be still better for the cow, and more to the interest of the farmer, if he were to wait a year longer ere the busines be completed."

From the great scarcity of milk, various sublittitates have been proposed for the early periods of weaning, some of which seem well calculated for the use they are designed. The method proposed by the duke of Northumberland is to take one gallon of skimmed milk, and to about a pint of it add half an ounce of common treacle, stirring it until it is well mixed; then to take one ounce of linseed-oil cake, finely pulverized, and with the hand let it fall gradually in very small quantities into the milk, stirring it in the mean time with a spoon or ladle, until it be thoroughly incorpo-rated; then let the mixture be put into the other part of the milk,
CAL

...it is first taken from the cow, and in that state it is fit for use. The quantity of oil-cake powder may, from time to time, be increased, as occasion may require, and as the calves become accustomed to the flavour of it. But Mr. Crook's method is to make a jelly of one quart of milk, boiled ten minutes in six quarts of water, which jelly is afterwards mixed with a small quantity of the bell hay-tea; on this he rears many calves without milk.

Mr. Donaldson observes, that calves when dropped during the grape-feason should be put into some small home-close of sweet rich pasture, after they are eight or ten days old, not only for the sake of exercise, but also that they may the sooner take to the eating of grapes. When they happen to be dropped during winter, or before the return of the grape-feason, a little short of hay, straw, or fedl corn, should be laid in the trough or stall before them. By means of inlet made into a jelly by boiling in water, calves have been reared without any milk at all, in the trials of Mr. Crook. The author of Practical Agriculture suggests that potato meal has been found to be useful in this intention, "as it mixes well with milk, water, or weak broth, and is highly nutritious."

Milk calves, that are intended to be kept should contently be castrated or cut at an early period, as in the full week or fortnight, the danger being considerably less when done early.

CALVES, falling of. In this practice the produce of the cow can in many situations be brought to great advantage; as in the vicinity of large towns. The method most commonly employed in fattening calves is to allow them to fatten; as by this method the object is probably not only sooner, but more effectually attained than by any other means. The period which is necessary for fattening calves must be different, according to circumstances, but it is generally from seven to nine weeks; however, in the dairy districts, where milk is considered a valuable article, scarcely half that time is allowed. There is another method, which is to give them the milk to drink; and when that is done, it is given them morning and evening warm from the cow, and the quantity increased according to their age and strength. In whatever way they may be managed, they should be kept in pens in a close well aired house, and well littered.

The author of the Synopsis of Husbandry observes, "that as it is necessary that the calves should lie always quiet, in order that they may indulge in sleep at those times when they are not employed in sucking; it seems proper that the cow-house should be situated in the most retired part of the yard, and that the pens should be kept as dark as possible. But notwithstanding this caution, the calves should by no means be suffered to lie too hot in the summer time, which would be apt to induce a sickness amongst them. To admit, therefore, an occasional draught of fresh air, let a window be cut in each pen, with shutters adapted to the same, and let these windows be opened whenever the closeness of the atmosphere indicates it to be necessary. In the summer season they should rarely, if ever, be closely shut, and when it is required, the stream of air may be increased by opening the cow-house door at the opposite end of the building. Each calf should have a collar round his neck, to direct him in his sucking, but should never be fastened up in the pen. It is necessary that the pens be constantly well littered with the cleanest straw, a proportion of which should be thrown in to them every day; cleanfleas being a most offensive article in the fattening of every animal, and not more necessary to airy than the calf, which, but for this precaution, would in a short time demonstrate the ill effects of lying on his accu-
mulated dung, which of all other animals is the most offensive, and of a quality highly feptic. Still as the calves are veal'd, they are to be taken into the pens, and fedded on their own dams, which at first will yield a far greater quantity of milk than is necessary for their offspring, so that another calf may be fedded thereon; or the cow may be milk'd, and the cream be reserved for butter, or applied to any other use that the owner may think proper. As the calf increases in size it will require a larger quantity of milk; but whilst they are young, one good cow will yield a noble supply for two calves; and when the produce is demanded for one calf, another new milk cow should be provided, and these new cows will abundantly supply the three calves with milk till the oldest is fit for the butcher; after which, if necessary, a fresh suckler may be brought in, and the business be carried on progressively by keeping the house constantly supplied with calves, so that the whole milk may be sucked as the different branches of the fattened calf and the dairy cannot be so conveniently united."

"For many of the southern parts of the kingdom, Smithfield market is the most convenient place to apply for sucklers, so as to be on a certainty of procuring them, this being the general receptacle where the milk-men vend their calves; and these having been bred from the larger Staffordshire or Holderness cows, do generally turn out to good account for the suckler, such large bony calves, when fattened, arising to a weight much more considerable than the ordinary produce of the country dairy-men; and as to the superior quality of milk required in fattening the larger breed of calves, this is amply recompensed by the greater increase of weight. The only hazard attending this Smithfield bargain is, the accident which may happen to the creature on the road, if the drift has been of any length; for, besides the cow-men above-mentioned, many sucklers are sent to this market from the vale of AYLESBURY, and these sometimes meet with accidents, either from the lengthened journey, or want of milk. From the former, the quiet of the pens generally recovers them, and the ill consequences of inanition may be obviated by feeding the creature to a short allowance for a few meals, till the caustic is removed. With these precautions, it will, he believes, very rarely be found that any fatal consequences succeed either of these evils. However it sometimes happens that, in spite of all our care, the suckler dies in consequence of imprudent management in the vendor; but as these accidents are not frequent, they ought not to deter the farmer from replenishing his pen by the London markets, where his vicinity to the metropolis will allow of the practice."

"Young calves," he says, "when permitted to suck their fill, are often seized with a lax or searming. To prevent which, the calves for the first fortnight or three weeks may be fed twice in their allowance; at the same time due regard should be taken that they do not pine or decrease in flesh for want of milk. But after this age, they should be allowed to suck as long as they choose, and every means ought to be made use of to increase their appetite, and render them more eager after their food. Chalk may be given for this purpose, as well as for giving to the flesh a delicate whitenss. Salt sprinkled in the troughs will likewise act as a stimulus to the appetite; besides which, it is a common practice with some people to cram their calves with balls compounded of flour, pounded chalk, and milk, with the addition of a small quantity of common gin. Of these they give two, about the size of a walnut, once a day, or oftener, to each calf. These balls being very nutritious, in some degree, supply the place of milk, and at the same time the spirituous mixture operates on the creature as a soporific;"
risie; and thus, by compounding them to sleep, increases their disposition to fatten. But where milk can be had in sufficient abundance, it is never worth while to have recourse to these fatitious aids. When the demands of the calf, however, are beyond the ability of the cow, these balls come reasonably to their relief. In order that the calves may be provided with sufficient stores of milk, the palliates should still be changed, whenever the cows are found to be deficient in this particular; and in the winter time, such food as is of an incident nature, as grains, turnips, &c. should be always at hand to supply the want of grass; and these, with a due allowance of the sweeted hay, should be their constant aliment during the time that the cows are confined to the yard.

“The prices of suckling calves vary according to the goodness of the young animal, and the time of year wherein the purchase is made. In general, sucklers fetch the highest price in summer, when veal sells the cheapest; and the reason of this arises from the smaller number to be met with at that time than in the spring. A good suckler in London can seldom be bought for less than 30s., and is often sold for 32s. or 33s. The butts of suckling was formerly reckoned to turn out to good advantage, when each calf throughout its fattening brought a profit to the farmer of three shillings a week; but now (1799) so considerably have provisions of every kind been advanced in price within these few years, the profit on the article of suckling is much greater.

When calves are slaughtered at fix weeks or two months old, the veal is seldom of a good colour; neither has the flesh of these young calves a taste equal to that where the animal has been suffered to live a few weeks longer. To attain both the ends of colour and flavour it is necessary that the calves should be maintained with plenty of milk, and regulated under such management as before directed, till they arrive to the age of eight or ten weeks, according to the season of the year, the more or less kindly rate of the calf, the particular demand of the markets, or other eventual circumstances. In the summer season, it may be proper to dispose of them at an earlier period then in the winter; not only on account of their growing away with greater celerity in warm weather, but likewise because of the increased demand for small veal, which is then most saleable. During the last three or four weeks, blood should frequently be drawn from the calf, which will be a likely means towards rendering the veal of a colour delicately white; a circumstance so much attended to by the butcher, that he will commonly depreciate such calves, which from the appearance of their eyes are likely to die black, as they term it, though in other respects not to be despised.

Such calves as are suckled on their own dams will, generally speaking, fatten in a shorter time than those which are afterwards brought to fatten to supply their places. The first obvious reason for this difference in their favour is their not having been removed from the places where they were first dropped, and having always continued to suck the milk of their parent animal, which must in all reason be suppos’d of a more nutritious quality to them than that of any other cow. Secondly, the cow having so lately calved, the aliment nourishes and fattens in a higher degree than when the creature becomes stale milked. Cow calves are offered to fatten more kindly than the male or bull calves; and these last are much more coarsely grained, and their flesh less delicate in taste than the former. Calves of the largest size are fattened in Essex, where the butts of suckling seems to be better understood, and more properly conducted than in any other county, and where the farmer keeps the calves to a greater age than in any other part of the kingdom.”

Mr. Marshall is clearly of opinion, that “to suckle calves in general after they are ten weeks old is bad management; for his account in this respect is uniform—those of nine or ten having paid as much a week as those of twelve or thirteen, and although a calf of six weeks old may suck nearly as much milk as a calf of twelve weeks old, yet the first month or five weeks the quantity is considerably less, and this advantage of their intance is doubly as valuable as nine as it is to twelve weeks.”

In some districts, barley-meal, in some boiled into a kind of jelly, and such-like articles, are given to calves in the course of fattening; but the methods above described are greatly superior, although it must be allowed that they may sometimes be considerably more expensive.

It is of the greatest importance in this practice to have good breeds of cows, to keep them constantly well fed, and the suckling houses airy, spacious, and perfectly clean from all faults of filth.

Calf-pens, a place formed for the purpose of receiving calves for the practice of fattening them.

In muft places it is the custom to have the calf pens annexed to the cow-houses. The only reason, Mr. Beaton observes, in his useful paper in the communications to the Board of Agriculture, “that he can allay why calf-pens should be within the cow-houses is, that it saves a little trouble to the dairy-maid, by having a shorter distance to carry the milk. In general, however, it is a plan not to be recommended, as every person who has had any experience among cows must know how naturally and how forcibly a new calved cow expresses her attachment to her calf; with what care and anxiety, if permitted, she licks it all over, and uses every exertion to protect it from injury; how the tender calf clings to its affectionate mother, as if sensible that to her alone it can trust for protection; and yet the poor helpless creature (says he) is dragged away, and placed perhaps within its mother’s view, or at least within her hearing, as if on purpose to augment the pain of her sufferings. Its delightful cries keep alive the pangs of the unhappy cow; the struggles to break the chain that binds her fast, and seems reliefs and uneasy whenever approached. In such a state of agitation it is impossible she can either feed well, or give that quantity and quality of milk she would otherwise furnish. Where there are many cows kept, and perhaps several of them lately calved, a single calf may keep them all in this rickets state: to remedy which, the beet way (says he) is to have the calves at fuch a distance, or at least to thicken a wall betwixt them, that the cows cannot hear their cries. The cow will then soon forget her calf, and will both feed and milk the better for it; therefore they should be as near as conveniently may be, without being liable to the above objections.

“To be dry and warm is of the greatest consequence in the rearing of calves, as is evident from what has been already advanced on the subject. Some think it necessary to accustom a calf to be bound with a halter from the hour of its being calved; others again turn them quite loose into the pen, and allow them to range and run about as much as they please. Which of these is the best method is here of little consequence. The principal thing to be observed in the construction of calf-pens is the laying of the floor, which should be made of laths or planks, about two inches broad, laid at the distance of an inch from each other upon joists, so as to make the floor above one, two, or three feet from the ground, as the situation will admit. This not only keeps them quite dry, by allowing all the moisture to
pals immediately away. It has the advantage of admitting fresh air below the bed, and thereby preventing that whole forest disagreeable smell too often found among calves; for, to be understood, that this place below the door should frequently be cleaned, as well as the floor itself, whenever it becomes wet or dirty; but it is not right to allow the litter to increase to a great thickness, otherwise the moisture will not so easily pass through. Calf pens are, however, too often made without this sparry floor, and the fresh litter always laid on the old, till the calves are removed, which is a slovenly practice, and not by any means to be recommended.

Stalls, or divisions, are but seldom made in calf-pens: at the same time it would certainly be much better to keep the calves separate from each other; by which means they will be more easily fed, and less liable to accidents. Partitions, about three feet high, of thin deal nailed on small posts, might be so contrived as to be movable at pleasure, to increase or diminish the stall if necessary, according to the age and size of the calf. This may be done as represented in the plate on calf-pens, fig. 1, which is the ground-plan of a double calf-pen for ten calves; a is the door; b the passage between the pens; ccc, &c. are the pens, showing the disposition of the partitions; ddd are four stalls, in which are several holes, as shown on the plan, for receiving iron pins, at the bottom of the partitions, to keep them in their place; e is a window or door, besides which there should be some other windows or air-holes as high up as possible. If it be thought unnecessary to make the partitions, there might be a small round trough, in a circular frame, fixed in the corner of each pen, as at f, for holding the milk, and a door in the next adjoining corner. A small flight back for holding a little hay, placed at the upper part of the pen, might also be useful. The troughs should be round, that the calves may not hurt themselves upon them, which they might probably do on the angles if they were square. Fig. 2, is a section of these pens, in which ss flew the position of the racks. The advantages of this kind of calf-pens are, that the calves are all kept separate in a small compass, and cannot hurt each other, as the stronger ones sometimes do the weaker, when confined promiscuously; and their food may be much more easily and equally distributed when they are not crowded.

If a great number of calves are feeding, as thirty or forty, or more, it might be so contrived in such pens, by pipes communicating with the troughs, that one person might give all the calves their milk at the same instant of time; and that any given quantity of milk, and no more, can go into each trough; but as this method would probably be but rarely required by the farmer, it is unnecessary, in a general point of view, to enter into an explanation of it.

In Gloucestershire, Mr. Marshall says, "the calf-pens are of an admirable construction; extremely simple, yet singularly well adapted to that intention. Young calves, fattening calves more especially, require to be kept narrowly confined; quietness is, in a degree, essential to their thriving. A loose pen, or a long halter, gives freedom to their natural fears, and a looie to their playfulness. Cleanliness, and a due degree of warmth, are likewise requisite in the right management of calves. A pen which holds seven, or occasionally eight calves, is of the following description:—The house, or room, in which it is placed, measures twelve feet by eight; four feet of its width are occupied by the flage, and one foot by a trough placed in its front; leaving three feet as a gangway, into the middle of which the door opens. The floor of the flage is formed of laths, about two inches square, lying lengthways of the flage, and one inch thick. The front fence is made of flages, an inch and a half in diameter, nine inches from middle to middle, and three feet high: entered at the bottom into the front bearer of the floor (from which croses joists pass into the back wall), and itched at the top by a rail; which, as well as the bottom piece, is entered at each end into the end wall. The holes in the upper rail are wide enough to permit the flages to be lifted up and taken out, to give admittance to the calves; one of which is fastened to every second flage, by means of two rings of iron joined by a swivel; one ring playing upon the flage, the other receiving a broad leather collar, buckled round the neck of the calf. The trough is for barley-meal, chalk, &c. and to ret the pails on. Two calves drink out of one pail, putting their heads through between the flages. The height of the floor of the flage, from the floor of the room, is about one foot. It is thought to be wrong to hang it higher, lest, by the wind drawing under it, the calves should be too cold in severe weather. This, however, might be easily prevented by litter, or long strawy dung thrust beneath it."

It is observable, that these flages are fit only for calves which are fed with the pail, not for calves which suck the cows.

Calf-flage, in Rural Economy, a term employed in some districts to signify the name as pen, probably from the floor being somewhat raised.

Calf-kins, in the leather manufacture, are prepared and dried by the tanners, skinners, and curriers, who sell them for the use of the shoe-makers, faders, bookbinders, and other artificers, who employ them in their several manufactures.

Calfskin tressed in sumach, denotes the skin of this animal curried black on the hair side, and dyed of an orange colour on the flesh side by means of sumach, chiefly used in the making of belts. The English calf-skin is much valued abroad, and the commerce thereof very considerable in France and other countries; where divers attempts have been made to imitate it, but hitherin in vain. What is likely to baffle all endeavours for imitating the English calf in France is, the smallness and weakness of the calves about Paris; which, at fifteen days old, are not so big as the English ones when they come into the world.

Calf, Golden, in Scripture History. See Golden Calf.
Calf, Sea, in Zoology. See Phoca Vitulina, and Sea-Calf.

Calf also denotes the young of the whale.

Calf, among Sportsmen, is used for a male hart or hind of the first year.

Calf-shot, in Botany. See Antirrhinum Orontium.

Calfat, in Ornithology, a species of Emberiza, the red-eyed bunting of Latham, a bird that inhabits the isle of France. This is smaller than the common sparrow; colour hoary; beak, throat, and margin of the tail, black; bill, legs, and orbits rosy. Gmel. &c. Obs. This is Le Calfat of Buffon.

CALHETA, in Geography, a small town of Madeira, in the district of Funchal.
CALI. See KALI.
CALI, in Geography, a town of South America, in a department of the name, in the province of Quito, and government of Popayan, built by Sebastian de Belalcazar. N. lat. 3° 15'. W. long. 73° 16'.

CALLACH-HEAD, a cape of Scotland, on the north-west coast of the island of Mull.

CAlIAYVARI, Luca, in Biography, a painter, was born at Udine, in Italy, in 1665, and acquired his skill by studying
studying and copying the works of eminent masters. His
taken subjects were eas-ports and landscapes, especially
views about Rome and Venice, which he described and ex-
cuted with strong simplicity, and elegance. His volume of
perspective views of Venice, toned with aqua-fortis, evince
his taste and abilities. He died in 1715. Wilkinson.

CALIBER, or CALLIPER, in a general sense, denotes the
extent of any round thing in thickness, or diameter.

In which sense we say, a column is of the fame calliper as
another, when they are both of the same diameter.

CALIBER more particularly denotes the bore, or width of
a piece of ordnance, or other firearms; or the diameter of
the mouth thereof, or the ball it carries.

The caliber is the rule by which all the parts of a cannon,
or mortar, as well as of its carriages, are proportioned.

CALIPHERS, a sort of compasses made with arched
legs, to take the diameter of convex or concave bodies.

Calliper-compasses are chiefly used by gunners, for taking
the diameters of the several parts of a piece of ordnance, or
of bombs, bullets, &c. Their legs are therefore circular,
and move on an arch of brass, wherein are marked the
inches and half-inches; to show how far the points of the
compasses are opened atender.

Some are also made for taking the diameter of the bore of
a gun or mortar.

The gunners also sometimes use calibers to embrace the
two heads of any cales, in order to find its length.

The caliper, used by carpenters and joiners, is a piece of
board notched triangular-wise in the middle, for the taking
of measure.

CALIBER, CALIBER-rule, or Gunner's CALLIPER, is an
instrument, wherein a right line is so divided, as that the
first part being equal to the diameter of an iron or leaden
ball of one pound weight, the other parts are to the first as
the diameters of balls of two, three, four, &c. pounds, are
to the diameter of a ball of one pound.

The calibers are tied by engineers, from the weight of the ball
given to determine its diameter, or calliper; or vice versa.

The gunner's callipers consist of two thin plates of brass
joined by a rivet, so as to move quite round each other; its
length from the centre of the joint is between six inches and
a foot, and its breadth from one to two inches; that of the
most convenient size is about nine inches long. Many
feet, tables, and proportions, &c. may be introduced on
this instrument; but none are essential to it, except those
for taking the caliper of shot and cannon, and for meas-
uring the magnitude of fallant and entering angles. The
most complete callipers is exhibited Tab. Gunners, fig. 2,
the furniture and use of which we shall now briefly describe.

Let the four faces of this instrument be distinguished by
the letters A, B, C, D; A and D consist of a circular head and
legs; B and C consist only of a leg.

On the circular head adjoining to the leg of the face A are
divisions denominated shot diameters, which shew the
distance in inches and tenths of an inch of the points of
the calipers when they are opened; so that if a ball not
exceeding ten inches be introduced between them, the bevil
diameter marks its diameter among the five divisions.

On the circular head part of the face B is a scale of
divisions distinguished by lb. weight of iron shot. When
the diameter of any shot is taken between the points of the
calipers, the inner edge of the leg A shews its weight in
avoirdupois pounds, provided it be lb. 3, 4, 5, 1, 1/2, 2, 3, 4,
5, 6, 7, 8, 9, 10, 15, 17, 20, 24, 25, 32, 36, or 42; the figures
nearer the bevil edge answering to the short lines in the
scale, and those behind them to the longer strokes. This
scale is constructed on the following geometrical theorem,

viz. that the weights of spheres are as the cubes of their
diameters.

On the lower part of the circular head of the face A is a
scale of divisions marked boses of gun; for the use of which,
the legs of the calipers are slipped across each other, till
the said points touch the concave face of the gun in its
greatest breadth; then the bevil edge F of the face B will
cut a division in the scale shewing the diameter of the bore
in inches and tenths.

Within the scales of shot and bore diameters on the cir-
cular part of A, are divisions marked pounders; the inner
figures 1, 1/2, 3, 4, 5, 1, 1/2, 2, 3, 4, 5, 6, 7, 8, 9, 10, 16, 18, 20, 25, correspond to
the longest lines; and the figures 1, 2, 4, 6, 9, 10, 16, 24, 30, 36, to the short
strokes. When the bore of a gun is taken between the points of the calipers, the
bevil edge F will either cut or be near one of these divisions, and shew the
weight of iron shot proper for that gun.

On the upper half of the circular head of the face A are
three concentric scales of degrees; the outer scale consisting
of 180 degrees numbered from right to left, 10, 20, &c.
the middle numbered the contrary way, and the outer scale
beginning at the middle with 0, and numbered on each side
to 90 degrees. These scales serve to take the quantity of
an angle, either entering or falling. For an entering, or
internal angle, apply the legs of the calipers so that its
outward edges coincide with the legs of the given angle, the
degree cut by the bevil edge F in the outer scale shews the
measure of the angle sought: for a falling, or external
angle, slip the legs of the calipers across each other, so that
their outward edges may coincide with the legs forming the
angle, and the degree marked on the middle scale by the
bevil edge E will shew the measure of the angle required.

The inner scale will serve to determine the elevation of
 cannon, or mortar, or of any oblique plane. Let one end
of a thread be fixed into the notch on the plate B, and
any weight tied to the other end; apply the straight side
of the plate A to the side of the body whose inclination is
sought, hold it in this position, and move the plate B, till
the thread falls upon the line near the centre marked Perp.
Then will the bevil edge F cut the degrees on the inner scale,
shewing the inclination of that body to the horizon.

On the face C near the point of the calipers is a little
table shewing the proportion of troy and avoirdupois
weights, by which one kind of weight may be easily reduced
into another.

Near the extreme of the face D of the calipers, are two
tables shewing the proportion between the pounds weight
of London and Paris, and also between the lengths of the
foot measure of England and France.

Near the extreme on the face A is a table containing four
rules of the circle and sphere; and geometrical figures
with numbers annexed to them: the first is a circle includ-
ing the proportion in round numbers of the diameter to its
circumference; the second is a circle inscribed in a square,
and a square within that circle, and another circle in the
inner square: the numbers, 28, 22, above this figure, exhibit
the proportion of the outward square to the area of the
inscribed circle; and the numbers 14, 11, below it, shew
the proportion between the area of the inscribed square
and the area of its inscribed circle. The third is a cube inscribed
in a sphere; and the number 89/4 shows that a cube of iron,
inscribed in a sphere of 12 inches in diameter, weighs 89/4.
The fourth is a sphere in a cube, and the number 95 shows
that a cube of iron, or a sphere of 12 inches in diameter,
weights 95.

The fifth represents a cylinder and cone of one foot diameter and height; the number
in the cylinder shews, that an iron cylinder of that diameter
and height weighs 364.4 lb. and the number 121.5 in the cone expresses the weight of a cone; the diameter of whose base is 12 inches, and of the same height: the sixth figure shows that an iron cube, whose side is 12 inches, weighs 454 lb. and that a square pyramid of iron, whose base is a square foot and height 12 inches, weighs 154 lb. The numbers which have been hitherto fixed to the four last figures were not strictly true; and therefore they have been corrected in the figure here referred to; and by these the figures on any instrument of this kind should be corrected likewise.

On the leg B of the callipers, is a table showing the weights of a cubic inch of various bodies in pounds avoirdupois.

On the face D of the circular head of the callipers is a table contained between five concentric segments of rings; the inner one marked Guns shows the nature of the gun, or the weight of ball it carries; the two next rings contain the quantity of powder used for proof and service to braze guns, and the two outermost rings show the quantity for proof and service in iron cannon.

On the face A is a table exhibiting the method of computing the number of feet or fathoms in a triangular, square, or rectangular pile. Near this is placed a table containing the principal rules relative to the full of bodies, expressed in an algebraic manner: nearer the centre we have another table of rules for raising water, calculated on the supposition, that one horse is equal in this kind of labour to five men, and that one man will raise a hogshead of water to eight feet of height in one minute, and work at that rate for some hours.

N. B. Hogheads are reckoned at fifty gallons.

Some of the leading principles in gunnery, relating to floating in cannon and mortars, are expounded on the face B of the callipers. Besides the articles already enumerated, the scales usually marked on the sector are laid down on this instrument: thus, the line of inches is placed on the edge of the callipers, or on the right borders of the faces C, D, the logarithmic scales of numbers, lines, verified lines, and tangents, are placed along these faces near the straight edges, the line of lines is placed on the same faces in an angular position, and marked Lin. The lines of plans or superficies are also exhibited on the faces C and D, tending towards the centre, and marked Plan. Finally, the lines of grids are laid on the same faces tending towards the centre, and distinguished by Sol. See farther on the construction and use of this instrument. Robertson's Treatise of Mathematical Instruments, &c. Appendix.

CALICA, in Mythology, an Indian goddess, which seems to have possessed the attributes of the Grecian Hecate. Mr. Blackmore, with a view of ascertaining the fact, that human sacrifices were offered to this horrible deity, examined the Puranas which bear her name. Birds, tortoises, alligators, fish, nine species of wild turkeys, buffaloes, bulls, he-goats, ichnuncus, wild horses, rhinoceroses, antelopes, guanas, rain-deers, lions, tygers, men, and blood drawn from the officer's own body, are looked upon as proper oblations to the goddess Chandica, &c. The following injunction afterwards occurs: when the facricce of lions, of tygers, or of the human species is requested, let the three frill claffes act these, having formed the image of the lion, tyger, or human shape, with butter, paflry, or harley meal, let them facricce the flame: as if a living victim, the axe being frill invited by the text : "Nomo!" that text is as follows: "Call! Cal! O horrid-toothed goddess! eat, cut, destroy all the magianst: cut with this axe; bind, bind, feize, feize: drunk blood, tear, tear: secure, secure: salutations to Cal!" Among other exceptions, with regard to human victims, those that are unwilling are expressly prohibited. Alatia Researches, vol. v. p. 374, &c.

CALI-CALIS, in Ornithology, the Madagacar Shrike, Lanius madagascariensis, stands under this name in Buffon's Natural History of Birds.

CALICO, in Geography, a river of European Turkey, which runs into the gulf of Salomki; 14 miles S.W. of Salomki.

CALICOLAN, COYLAN, or QUILON, a Dutch factory on the western coast of Malabar, an at 14 geographical miles to the N.N.W. or N.W. of Arjengo, or Arjenga, placed by major Rennell in N. lat. 8° 35’. L. long. 76° 40’.

CALICULA, in Ancient Geography, a town of Spain, placed by Ptolomy in the Tarragonensis, and appilned to the Turdab.—Also, another town of Spain, which Ptolomy places in the territory of the Turdetani.

CALICUT, in Geography, a country of Afa, and a very extensive flat on the coast of Malabar. Its chief allumed the title of king of kings. The hall of these princes, called Sarana Parimal, having embraced Mahometanism, retired to end his days at Mecca, and dividing his dominions between the princes of his own blood, relived, as it is said, a space of 12 leagues for one of these princes, or a favourite page, who was to have the title of Samorin, and to whom the others were to render homage. The samorin built a city on the spot whence Parimal took his departure, and called it Calicuent. He who afterwards governed Calicut, inhabited a palace of Rome, and annexed some appearance of grandeur to his court. In former times, the inhabitants of this district had several strange customs, some of which are still retained. Accordingly it is said, that the Samorin's wife must be first enjoyed, for three nights if he pleases, by the high priest. The nobles permit the other priests to take the fame liberty; but the lower people are debarred from this honour. A woman may marry a number of husbands; each of whom has her by turns for ten days or more, as they agree among themselves; and during that time he provides for her all necessaries. When she proves pregnant, the name the father of the child, who, after it is weaned, takes care of its education. The "Naires" of Calicut form band of nobles, whole only profession is that of arms. These men, though of an olive colour, are comely and handsome; they are tall and hardy, very valiant, and dextrous in the use of their weapons. They lengthen their ears to such an extent, that they hang down on their shoulders, and sometimes lower. Their Naires are allowed only one wife, but the women of rank may have as many husbands as they chuse, whom they regard as slaves subjected to their beauty. Women of inferior condition supply the defect of the privilege appropriated to ladies of rank, by indiscriminate commerce with strangers, from which their husbands cannot restrict them. The mothers prostitute their daughters even before they arrive at a proper age. The "Naires," or nobles of Calicut seem to be of different race from the burgesses; for the latter, both males and females, are of a smaller stature, and are ugly, and more ugly. Among the "Naires" there are some men, as well as women, whose legs are as thick as the body of an ordinary man. This deformity is not the effect of disease, but comes from their birth. The skin of these legs is hard and rough like a wart; and, nevertheless, the persons afflicted with it are nimble and active. This race of men with thick legs, has not multiplied greatly; either among the "Naires," or the other Indians. However, they appear in other places, and especially in Ceylon, where they are said to be of the race of St. Thomas. Du Buffon's Nat. Hist. vol. iii. p. 99. Eng. Ed. The people of this country have no pens, ink, or paper;
paper; but write with a bodkin on flags that grow by the sides of the rivers, which are so strong as to be durable for many years. The district called Calicut is about 65 miles long, and nearly as many broad. The air is salubrious, though it has many woods, rivers, and marshes; the soil is fertile, but it does not produce much grain; it is subject to inundations from the sudden descent of the mountain-rivers; and the sea also has made such ravages on the coast as to oblige the Samorin to transfer his residence from Calicut to Pananany. Along the sea coast, the land is low and sandy, and produces a number of cocoanut-trees. The higher grounds produce pepper and cardamonds of a good quality. The country also supplies timber for building, white and yellow sanders, caffia lignea and siltula, nux vomica, and cocculus indicus. The forests abound with parrots and monkeys, and various sorts of game; they have plenty of fish, and their mountains yield iron. The Samorin is said to be able to raise an army of 100,000 men.

Calicut, the capital of the country above described, is situate on the coast of Malabar. This city is remarkable for being the first Indian port visited by European shipping. Vaejo de Gama, having doubled the Cape of Good Hope, and pursuing his navigation along the south-east of Africa, arrived at the city of Melinda; and conducted by the pilots of this civilized and commercial city, he sailed across the Indian Ocean, and landed at Calicut, on the 21st of May 1498. This was at that time the most flourishing place on the Malabar coast. The Samorin, or monarch of the country, astonished at this unexpected visit of an unknown people, whose affect, arms, and manners, bore no resemblance to any of the nations accustomed to frequent his harbours, and who arrived in his dominions by a route hitherto deemed impracticable, received them at first, with that fond admiration which is often excited by novelty. But in a short time, as if he had been inspired with foreknowledge of all the calamities now approaching India by this fatal communication opened with the inhabitants of Europe, he formed various schemes to cut off Gama and his followers. But from every danger to which he was exposed, either by the open attacks, or secret machinations of the Indians, the Portuguese admiral extricated himself with singular prudence and intrepidity, and at last failed from Calicut with his ships loaded, not only with the commodities peculiar to that coast, but with many of the rich productions of the eastern part of India.

Calicut, though much fallen in its consequence, is still a large town, containing about five or six hundred houses, built of wood, or bricks baked in the sun, in the middle of which are beautiful gardens. Thus circumcised, it is three leagues in circumference, including a large village or suburb, inhabited by fishermen. It is governed by a vicerey, but wants a regular police; and its commerce, which is still not inconsiderable, on account of a convenient river by which timber is brought down from the neighbouring mountains, is much oppressed by burdensome duties, generally farmed by Mahometans. The coast is low, and affords no shelter, and the only access to it is by small flat-bottomed boats. But though it has no harbour, it affords to the ships that visit it good riding in the open sea, at the distance of three leagues from the shore. The English factory, which formerly subsisted in this place, is now removed to Tulicherry. N. lat. 11° 18'. E. long. 76° 4'.

Calidris, in Ornithology, a species of Scopolarx that inhabits Europe and America, and well known in this country by the name of red-shank. The bill is straight and red; legs scarlet; secondary quill feathers white. Kramer. This is the totanus of Drifton, scolopax totanus of the Fauna Suecica, rothien of Friisch, &c.

Of a. A variety of this species is found in China, the body of which is grey above, and beneath white; lower part of the neck, and side of the breast, spotted with blackish; rump and tail barred with black and white. Latham, &c.

Calidris, a species of Tringa, the bill and legs of which are blackish; body beneath olivaceous; rump variegated. Gmel. This is the dusky sandpiper of Latham; calidris of Drifton; rallioca fylvatica of Groner and Aldrovanus; and manchurae of Buffon. Inhabits the maritime parts of France and Germany. Length nine inches and an half.

Calidris, a species of Motacilla, called by Latham the hang-nell warbler; and American nightingale of Edwards. The plumage is greenish-brown above; beneath, fulvous; ocular line, and another beneath it, black. Gmel. This is the Scedula Jamaicens of Drifton; and grand sifuer de la Jamaque of Buffon.

This bird is of the size of a robin, and builds a hanging nest; it inhabits Jamaica, and is supposed to be the watchy picket, Spanish nightingale, or American hang-nell of Sloane.

Calidris nigra, the name under which Aldrovanus describes Tringa gambeletis, the red legged heronman of Albin, and gambet of other English writers.

Calidris grisea of Brifton is the Gmelinian Tringa griseta; and Calidris grisea minor of the same author: Tringa arnoria of Gmelin. Brifton also describes Tringa nevia of Gmelin under the name of Calidris nevia. Calidris beloni of Aldrovanus is the Calopax calidris of Kramer, &c.

Calidris, a species of Charadrius, called in England the sandpiper or curwillet. The bill and legs of this bird are black; lores and rump greyish; body beneath white, without spots. Georg. It inhabits the sandy coasts of England and North America. Length eight inches.

Of b. There is a variety of this species in which the front, and body beneath is cinctuous white.

CALIDUCs, from color, heat, and deo, I lead; a kind of pipes, or canals, disposed along the walls of houses and apartments; used by the ancients for the conveyance of heat to several remote parts of the house, from one common furnace.

The ancient caliduits seem both for their beauty and use preferable to the German flowers; and might even challenge the advantage over our own fashion, were it not that the very fire of a sight adds something of lustre to a room.

CALIDUS, in Entomology, a species of Cimex of the middle size, found in Africa. The colour above is fusces; beneath, yellowish, with black antennae. Fabricius.

Calies, in Geography, a small town of Germany, in the circle of Upper Saxony, and New Mark of Brandenburg, chiefly inhabited by weavers of woollen cloth; 16 miles E. of Dorz.

California, a tract of country, formerly thought to be an island, but now ascertained to be a peninsula, on the western coast of North America, bounded on the north by the continent, with which it is connected, on the east by the province of New Mexico and the gulf of California, or the Vermilion Sea, which separates it towards the southern part from the continent, and on the south and west by the great Pacific Ocean. This peninsula terminates on the west at Cape Santiago, in N. lat. 35° 40', and W. long. 110°, and extends northward to limits that have not been precisely ascertained. Some have fixed its northern extremity at Cape St. Schafftan, in N. lat. 43° 30'; whilst others have extended it to 46°, and have made its length 600 leagues, and its breadth at different places, 10, 20, 30, and 40 leagues. North California, indeed, of which the most northern settlement is San Francisco, in N. lat. 37° 55'.
CALIFORNIA.

The enterprise of Cortes, the Spaniards, were first intended for the discovery of the extensive peninsula of California. Having fitted out several small squadrons for the purpose of protecting such voyages of discovery as he could make, from the ports of New Spain in the South Sea, which either perished in the attempt, or returned without any success of importance; this adventurous conqueror of Mexico determined to take the command of a new armament in person; and, after enduring incredible hardships, and encountering every kind of danger, he at length, viz. in 1540, discovered this peninsula, and surveyed the greater part of the gulf which separates it from New Mexico. During a long period, however, this country was so little frequented, that even its form was unknown; and in most charts it was represented as an island, and not as a peninsula.

In 1542, Mendocino, vicerey of Mexico, dispatched Francisco Alercon to search towards the west for the pretended strait of Anian; but he advanced no higher than the latitude of 36°, and made no discovery. This same project was renewed in 1543, by Rodríguez de Cabrillo; but this whole expedition served only to explore a cape in the latitude of 41° 30', which was denominated Capo Mendocino, in honour of the Mexican vicerey. In 1578, Sir Francis Drake found, that in the latitude of 48°, there existed lands and men; and after having reconnoitered the coast through an extent of 220 leagues, which terminates in 37°, he called the country which he had discovered "New Albion," and took possession of it in the name of Elizabeth, queen of England. In the latitude of 38° 30', he discovered the harbour where he made some stay, and which has preferred his name. From an account of Drake's voyage, published in a treatise entitled "The World encompassed by Fletcher," London, 1673, 4to, it appears, that he gave to the country which he discovered the name of "New Albion," for two reasons: first, because from the nature of the rocks and shoals with which the coast is skirted, it presents the same aspect as that of England; and secondly, because it was reasonable and just, that this land, till then unknown, should bear the name of the country of the first navigator who landed there. In 1592, a Greek of the island of Cephalonia, Juan de FucUA, in the service of Spain, discovered towards the 49th parallel, a large strait by which he pretended to have reached the Atlantic Ocean. Fucua's strait, or inlet, has been found again in our days; but the communication of the two oceans is neither better proved, nor more probable, and might perhaps exist only in his account. See Fucua's Strait. In 1595, a galley was sent to make discoveries on the shore of California; but the vessel was unfortunately lost in Port des los Reyes. In 1602, the Spanish admiral, Sebastian Viscaino, or Bifcaas, was charged by count de Monterey, vicerey of New Spain, to explore, to the north of California, a harbour that might afford an asylum to the galleons on their return from Manila: he discovered a commodious one, safe and well situated, in the latitude of 36° 40', to which he gave the name of the vicerey Monterey, and which is since become the principal settlement of the Spaniards on the N.W. coast.

It is asserted, that a small vessel belonging to his squadron, commanded by Martin de Aguilan, found between 40 and 44 degrees, the mouth of a great river which bears his name on the geographical maps. It is added, that, having succeeded in doubling Cape Mendocino, which, till then, had only been perceived, he discovered on the 13th of January 1603, 30 leagues more to the northward than this cape, in the latitude of 43°, a second cape or point, to which he gave the name of Capo Blanco, and that the navigable inlet or large river which he discovered is near this cape, and that it is a strait which leads to a great city, named "Qui&ria;" but that he was prevented by the rapidity of the current from ascending the river. The navigators of later times have procured no information respecting either this inlet of Aguilar, or the great city of Quivira.

La Pérouse, who, in 1786, gave a distant view of Capo Blanco, and of the parts of the coast which are nearest to it to the northward and southward, saw nothing of Aguilar's inlet; but as he was then at a considerable distance from the land, and as he did not make a particular search for this inlet, no conclusion can be drawn from his account against its existence. Most of the geographical and hydrographical charts place Aguilar's inlet or river to the southward of Capo Blanco; but Tomas Lopez, in his general chart of America, published in 1772, lays it down 20 leagues to the northward of that cape, in the latitude of 44°, with this simple indication, "Rio que corre a Puente," river that runs to the west; and he makes no mention of the great city Quivira.

In 1640, admiral Bartolomeo de Fuente, or De FucUA, is said to have discovered, towards the parallel of 45°, the archipelago of San Lazaro, the river of Los Reyes, some great lakes, &c. and an easy passage of communication between the Great Ocean and the North Atlantic Ocean. This discovery, inferred in an account, the authenticity of which has been contested, and in which truth is blended with falsehood, has been confirmed by modern navigators, as to what regards the archipelago of San Lazaro, and perhaps an interior sea; but the communication of the two oceans is not better established than that which had been opened by Juan de Fucua. About the middle of the last century, Joseph Nicolas de Lisle, and Philippe Buache, published learned dissertations and ingenious systems for the purpose of reconciling the discoveries of De Fucua on the N.W. coast of America with what is known beyond of that northern part of the new continent. Other geographers and learned persons have considered the account of De Fucua as counterfeit and apocryphal; and among the latter is Dr. Reinhold Forster, who, with his son George Forster, accompanied captain Cook in his second voyage, and to whom we are indebted for an excellent "History of the Voyages and Discoveries, made in the North." M. de la Pérouse also expresses his thorough disbelieve of the narrative ascribed to admiral de Fuente, and of the reality of any discoveries in the contested channel of San Lazaro, or St. Lazarius. Mr. Millet Mureau, on the contrary, acknowledges himself one of the strongest partisans for the existence of a north-west passage. Indeed, when we consider, that since the question first arose concerning a north-west passage from Europe into the Pacific Ocean, many scientific and capable men have been conjointly on the watch, and eager to pursue the inquiry, it is not at all probable that such voyages as are related by Mureau, if really made, should not have been fully verified; and that there should remain no other traces of them than a kind of vague tradition.

During almost a whole century, if we except the contested voyage of De Fucua, the west coast of North America was not visited by any of the nations by which it was conquered, or by any of those which have been since called thither by the allurements of commerce. But although Spain made no maritime expedition, she did not neglect to push by land her discoveries towards the north; and the excursions which she planned and ordered, at different periods, led to a discovery, to the southward of California, of the rich
rich provinces of Sonora and Cinaloa, which fee. In 1584, the marquis de la Laguna, viceroy of Mexico, dispatched two ships with a tender, to make discoveries of the lake of California, of which he brought back an indifferent account; though he was among the first who ascertained its being joined to the continent of America, and contiguous to that of Aia. It is said, however, that we owe to father Cahin, a German Jesuit, the absolute certainty that California is a peninsula, joining to the continent of New Mexico, and the more northern parts of South America. He landed on the former from the island of Sumatra, and passed to the latter without crossing any other water than the river Azal, into which the Rio Colorado falls, in about the 35th degree of north latitude. Dr. Robertson observes, that the uncertainty of geographers with respect to this point is remarkable, as Cortes seemed to have surveyed its coast with great accuracy. The archbishop of Toledo has published from the original, in the possession of the marquis del Valle, the descendant of Cortes, a map drawn in 1541, by the pilot Domingo Caffillo, in which California is laid down as a peninsula, stretching out nearly in the same direction which is now given to it in the best maps, and the point where Rio Colorado enters the gulf is marked with precision. Towards the close of the 17th century, the Jesuits, who had great merit in exploring the neglected province of California, and in civilizing its rude inhabitants, imperceptibly acquired a dominion over it as complete as that which they possessed in their missions in Paraguay, and they laboured to introduce into it the same policy, and to govern the natives by the same maxims. In order to prevent the court of Spain from conceiving any jealousy of their designs and operations, they feign flattering to have depreciated the country, by representing the climate as so disagreeable, and infederable, and the soil so barren, that nothing but a zealous desire of converting the natives could have induced them to settle there. Several public-spirited citizens endeavoured to undeceive their sovereigns, and to give them a better view of California; but without effect. At length, on the expedition of the Jesuits from the Spanish dominions, the court of Madrid, as prone at that juncture to suspect the purity of the order's intentions, as formerly to confide in them with implicit truism, appointed Don Joseph Galvez, whose abilities afterwards raised him to the high rank of minister for the Indies, to visit that peninsula. His account of the country was favourable; he found the pearl-fishery on its coasts to be valuable, and discovered mines of gold of a very promising appearance. From its vicinity to Cinaloa and Sonora, it is probable, that if the population of these provinces should increase to the degree that may reasonably be expected, California may, by degrees, receive from them such a recruit of inhabitants, as to be no longer reckoned among the desolate and unprofitable districts of the Spanish empire. To this intelligent minister, Spain is indebted for a new distribution of government in its American provinces, and for several important alterations in the state of their police and revenue, as well as a general reformation of the tribunals of justice in America. Since the limits of the viceroyalty of New Spain have been considerably circumscribed, four of its mott remote provinces, viz. Sonora, Cinaloa, California, and New Navarre, have been formed into a separate government; and in time, the beneficial effects of this arrangement may be very considerable. Under the immediate inspection of a governor, to whom these rich provinces are specially committed, they must rise into importance and prosperity; and in common with many other districts of America, long depressed by the languor and feebleness natural to provinces which compose the extremities of an over-grown empire, they may be animated with vigour and activity, when brought to bear the force of power as to feel its invigorating influence.

It was not till the year 1741, that Beering and Tchirikov, in the service of Russia, discovered the north-west coast of America; the former, towards the 58th parallel; the latter, towards the 56th. Since that period, the discoveries of the Russians have extended from the parallel of 56° to the mild northern part of the west coast; and they have comprised, in the surveys which they have made of it, the peninsula of Alaska, and the long chain of the Aleutian islands, both belonging to the continent of America.

After a period of 167 years of lethargy, the spirit of discovery, and the tale for expeditions to the north, revived among the Spaniards. Accordingly, in 1779, vessels were dispatched from the port of San Bias, under the command of Don Vincente Vila, in order to establish a presidio at the harbour of San Diego, in N. lat. 33° 40', on the rail of California; and another at that of Monterey in N. lat. 36° 25', but this expedition afforded no discovery; however, after a whole year of researches and fatigue, the Spaniards succeeded in finding again the harbour of Monterey, the latitude of which had been indicated to them by Vicenzo in 1682. Discoveries in higher latitudes were suspended at this time; because an object of greater importance, and for the accomplishment of which, Don Joseph Galvez had been commissioned from Spain, occupied the whole attention, and all the efforts of government. In 1775, a second expedition, under the direction of Don Juan de Ayala, and of his pilot Don Francisco Antonio Murelle, effected the discovery of some capes, and of some bays and harbours between the 47th and 55th parallels. This voyage made known the harbour of Trinidad in N. lat. 41° 7'; Cape Meafari, in 45° 57'; Cape St. Angelina, in 55° 17'; port Bucarelli, in 57° 16'; Mount San Jacinto, and Cape del Angano, in 57° 21'; Guadalupe bay, in 57° 11', in its north part; the harbour of Los Remedios, in 57° 18'; and St Francis Drake’s harbour of Francisco, in 38° 18'. A third and a fourth voyage in 1778 and 1779, made no additional discovery; and the second merely afforded the assurance that the Russians had formed fixed settlements on several points of the high latitudes. But, as far back as 1778, while the Spaniards were employed in a minute survey of their port Bucarelli (see Bucarelli), the drift of navigators, as he is deciphered from the letters of M. Fleurius, Captain Cook, carried his talents, experience, and information, towards the north-west coast of America; and Europe owes to his industrious researches the first certain knowledge that she has had of the west part of the new world. He made the land on the 7th of March 1778, in the latitude of 44°. Thwarted by the winds, he could only dilate in a few capes or points of land, called Cape Gregory, Cape Perpetua, and Cape Foulweather, the 8th of the three, or Cape Gregory, which he places in 43° 16', appears to be Agnaha’s Cape Blanco, so called by him in 1662. He left the land again till he reached it in 48°, where he perceived, at a distance, in 48° 15', a cape which he named Cape Flattery. At length, after long struggling with adverse winds, he ran in for the land, in the latitude of 49° 36', and anchored in a bay which he first called King George’s Sound, and known among the inhabitants of the country by the name of “Nootka.” This Nootka Spain claimed in 1790, as an integral part of her American dominions. Having examined a few points above the 50th parallel, he discovered, in 60°, Prince William’s Sound, and Cook’s river; and having rounded the peninsula of Alaska, he visited some of the Aleutian islands (see ALEUTIAN), and thence advancing to the highest latitudes which
CALIFORNIA.

which the late parables navigators to reach, he blended his
distle with that which the Spaniards had made from the
time, and building on the house of America, by the
skins of the skins, which are the treasures of the forests
of north-west America; in short, he opened a new career to
the ever-increasing activity of a nation, whose commercial
operations embrace the two hemispheres throughout the
whole circumference of the globe. In 1596, La Pérouse
directed his course towards the N.W. coast of America, and
made land on Bering's mount St. Elias, in the latitude of
50°, he ranged along the lands of the continent for an
expanse of 270 leagues from that parallel to the harbour of
Monterrey, and particularly applied himself to the examina-
tion of these parts of the coast from which captain Cook
had been repulsed by contrary winds; he discovered a fine
harbour in N. lat. 58° 17', which he called "Port des Français," (which fees); and in the course of his surveys, which were
both minute and accurate, he verified and confirmed some
of the discoveries of 1775, which the Spaniards had scarcely
indicated.

Of Monterrey, and the adjacent country, La Pérouse has
given a particular account, of which we shall avail ourselves
under that article. This is the place of residence of the go-

domor, with the northern and southern, or the New and Old. This
government is subordinate to the vice-royalty of Mexico; and La Pérouse informs us, that it extends to more than 300 leagues in circumference, for
the maintenance of which 282 soldiers of cavalry are found
sufficient. These garrison five small forts, and furnish det-
thachments of four or five men to each of the 2 5 millions, or
parishes, into which the provinces of Old and New Califor-
nia are divided. These small guards suffice to keep in sub-
jection about 50,000 wandering Indians, who often change
their residence according to the fishing and hunting fea-
son, and who are spread over this vast extent of the American
continent. Of these, about 10,000 have embraced Christi-
anity. These Indians are generally little and feeble, and
ev'n no signs of that love of independence and liberty, which characterizes the northern nations, to whose arts and
industry they are strangers. Their complexion very nearly
resembles that of those negroes, whose hair is not woolly:
that of this nation is long, and very strong, and they cut it
four or five inches from the roots. Several of them have
beards, while others, according to the millonaries, never
had any; though this is a point not decided in the country
itself. The governor, who had travelled much in the in-
terior part of the country, and had lived with the savages
during 15 years, assured La Pérouse that those who had no
beard, had extracted it with bivalve shells, used as pins
ers. The president of the missions, however, who had refrained
as long in California, maintained the contrary. These
Indians are very expert in the use of the bow, but they rarely
pull the bow till they creep within 15 paces of their prey.
In hunting, they crawl on the ground, with flags' heads
fixed on their own, and thus approach a herd of fags, till
being within reach of them. they kill them with their ar-
rows. Loretto is the only presidio or military fort of Old
California, on the easter coast of that peninsula. Its gar-
rision consists of 254 cavalry men, and furnishes detachments
to the 15 following missions, of which the functions are
performed by the Dominican monks, who have succeeded the
Jesuits and Franciscans. These last, however, remain
in undisturbed possession of the ten millions of New Califor-
nia. The 15 millions of the department of Loretto are,
San Vincente, S. Domingo, El Rosario, S. Fernandez,
S. Francisco de Borgia, S. Gertrudis, S. Ignacio, La Guad-
alupe, Santa Rosalia, La Concepcion, S. Josef, S. Fran-
cisco Xavier, Loretto, S. Joseph de Calo Lacor, and To-
dos los Santos. About 400 Indian converts, collected
round these 15 parishes, are the only fruit of the long
apostleship of the various religious orders, who have suc-
ceeded in undertaking this painful duty. As yet there is only
one Spanish village. Indeed, the climate is unhealthy, and
the province of Sonora, which forms the boundary of the Ver-

turion sea to the westward, and California to the northward,
is much more attractive to the Spaniards, who find there
a fertile soil, and abundance of mines; which are, in their
evaluation, more important objects than the pearl fishery of
the peninsula, which requires a considerable number of slaves
who can dive, and whom it is difficult to procure. Yet North
California, notwithstanding its great distance from Mexico,
appears to combine much greater advantages. For an
account of its presidios, see New Albion. The Franciscans
established their first mission here in 1770; and they have
now ten, comprehending 5141 converted Indians. The
picty of the Spaniards has kept up the presidios at a great
expense, apparently from no other motive than that of
converting and civilizing the Indians of these countries. But
from later discoveries, a new branch of commerce may pro-
cure to Spain more solid advantages than the richest mines
of Mexico, and the fertility of the soil, and the abundance of
furs, for which they have a certain market in China, give to this part of America the most
important advantages over Old California, whose unholy
stones and fertility cannot be compensated by a few pearls
collected from the bottom of the sea.

Before the Spaniards settled in this country, the Indians
of California only cultivated a little maize, and almost en-
tirely subsisted on fishing and hunting. No country abounds
more with all sorts of fish and game. Hares, rabbits, and
flags, are very common; otters and sea-wolves abound to-
wards the north; and in winter they kill a great number of
bears, foxes, wolves, and wild cats. The coppices and
plains are full of small, cottage partridges, which flock to-
go in coys of 3 or 400; they are fat and well fla-
voured; and the trees afford lodging to a vast variety of
birds and fowl. As to the fertility of the soil in the coun-
try adjoining to the presidio of Monterrey, it exceeds con-
ception. The harvets of maize, barley, wheat, and peas,
can only be compared to those of Chili; and the average
produce of corn is from 70 to 80 fold. Fruit trees are li-
therto scarce; but the climate is well adapted to them, be-
ing nearly that of the southernmost provinces of France.
The cold is never more severe, and the heats of summer are
much more moderate, and consequent of the perpetual mills,
which ferment the earth with continual mossiture. The fu-
rolls contain the pine-apple fir, cypres, ever-green oak,
and wellan plane-tree. La Pérouse pays a tribute of singular
respect to the monks of this presidio; and contributes their
dispensation and conduct, very much to their advantage,
against those of the monks of Chili.

The huts of the Indian villages, in both Californias, are
the most miserable that can be conceived. Their form is
circular, and six feet in diameter by four feet high. Some
flakes about the size of the arm being fixed in the ground,
and brought together in an arch at top, compose their
frame, and eight or ten trusses of thraw, badly arranged
upon these flake, defend the inhabitants more or less from
the rain and wind. The Indians adhere to this mode of con-
structing their habitations, notwithstanding the exhortations
of
of the missionaries, alleging, that they love the open air, and that they can easily let fire to their huts when they are too much annoyed by flies, to which vermin they are subject, and then rebuild them in an hour or two. Besides, these habitations are most suitable to those independent Indians who are perpetually changing their abode. The colour of these Indians, the huts of the monks, their magazines built of brick and plastered, the threshing floor on which they tread out their corn, the cattle, the horses, and, in short, every thing presented the appearance of a plantation in St. Domingo, or any other colony. The men and women are assembled by the found of a bell, and a monk leads them to work, to church, and to all their employments. The monks are the temporal, as well as spiritual, superiors, and the whole produce of the earth is committed to their management. The day is divided into seven hours of work, and two of prayer; but four or five on Sundays and fealt-days, which are wholly devoted to red and religious worship. Corporal punishments are inflicted on the Indians of both sexes, who neglect their pious exercises; and many crimes, which in Europe are referred to divine justice, are punished with chains or the rods. As soon as a new convert is baptized, he is under the obligation of a perpetual vow; and if he desert the religious society, and return to his relations, he is summoned three times to come back; and if he refuse, a party of soldiers is sent by the authority of the governor, to force him away from his family, and conduct him to the missions, where he is condemned to receive a certain number of blows. The Indians, like the missionaries, rise with the sun, and then go to prayer and to mafs. During this time, barley-meal is boiled in a cauldron, and the mafs, which the Indians call "atole," and which they much like, is seasoned neither with butter nor fat. This repast occupies about three-quarters of an hour, after which, all go to their respective occupations, under the superintendence of one or two monks. The employment of the women, besides that of conducting their household affairs, is the management of their children, and the rolling and grinding of their grain; they also spin their wool, and manufactures some coarse flax. At noon the bells ring for dinner, and the Indians partake of a mafs similar to that of their breakfast, called "ponfole," except that it is thicker, and contains, besides the corn and maize, peas and beans. From two to three they return to work till four or five, and close the day with prayers, and with another mafs of atole. The distribution of these mafes is faithfully made; and the least dishonesty is punished by the lash, which is ordered by Indian magistrates, called "Caciques." The punishment inflicted on the women is private; but that of the men is public, that it may serve as an example. Their rewards consist in small distributions of grain; and on feast days, their mafs of beef, which many eat raw.

Such is their honesty, that no example occurs of their robbing one another, though they have no other door than a truss of straw laid across the entrance when the whole family is absent. The men in these missions have furnished more to Christianity than the women; for to them paga-ymony was allowed, and it was even the custom to marry all the fathers of a family. The monks make themselves the guardians of female virtue; for, about an hour after supper, they lock up all those who have husbands absent, as well as all girls above nine years old, and place them under the care of matrons during the day; but all these precautions are in some cases insufficient. The converted Indians retain all their ancient customs, that are not forbidden by their new religion; the same laws, the same games, and the same dreeses. The richest wear a cloak of otter-skin, covering the loins, and reaching below the middle; others wear only a piece of cloth to cover their shoulders, and a little cloak of rabbit-skin, covering the shoulders, and reaching to the loins, and tied with a pack-thread under the chin. The women’s dress consists of a sheet of flax, which is badly tamed. Young girls, under nine years old, have only a girdle round the loins, and the boys are wholly naked. The hair of both men and women is cut four or five inches from the roots.

The Indians of the “Rancherias,” or villages of independent Indians, having no iron utensils, perform this operation with fire-brands, and paint their bodies red, which they change into black when in mourning. They retain an affectionate remembrance of their deceased friends, and are easily melted into tears by the mention of them: nevertheless, children scarcely know their own father, because they defert his but as soon as they are able to provide for themselves; but they are more durably attached to their mother, who brings them up with care and tenderness. The old men of the Rancherias, who are no longer able to hunt, live at the joint expense of the whole village, and are treated with general respect. Their arms are the bow and arrow, pointed curiously with a flint. These Indians neither eat their prisoners, nor their enemies killed in war; although when they have conquered, and put to death some chiefs, and very brave men in the field of battle, they eat some morsels of their bodies, thus doing homage to their valour, and apprehending that such food would increase their courage. They are accustomet, like the Canadians, to take off the scalp of the vanquished, and to tear out their eyes, which they have the art of preserving from corruption; and it is their practice to burn their dead, and to deposit their ashes in a morain. The mixed government exercised in the missions of California is, with regard to the Indians, a real theocracy; for they are taught to believe that their superiors hold an immediate and constant intercourse with God, and that they bring him down each day upon the altar. Under favour of this opinion, the fathers live in the midst of the villages in perfect security, nor do they shut their doors during the night. Murder is very uncommon even among the independent tribes, and is punished only by general contempt; but if a man falls under the united attack of several affidants, he is supposed to have deserved his fate, as he had drawn upon him so many enemies. M. la Perouse observes, that the sense of table is that which these people most delight in gratifying; and the word "Milchi," which in their language signifies a good man, likewise denotes favoury food. Among other peculiarities of these people is their gaming; it is remarkable for the ingenuity of their games than for the nature of the flaks. Among the Indians of the missions, the common flake is beads; but among the independent Indians, the favours of their women are the prizes. New California, we are told, cannot yet reckon a single settler, notwithstanding its fertility, except a few soldiers who are married to Indian women. La Perouse observes, that the administration of the villages converted to Christianity would be more favourable to population, if property and a certain degree of liberty formed its basis. However, since the establishment of the ten different missions of North California, the holy fathers have baptized 7,015 Indians of both sexes, and have buried only 2,883. Almost all the Franciscan missionaries are Europeans, and they have a college and monastary at Mexico, whose guardian is, in America, the general of his order; and this house has its superior in Europe.

The sea-otter skins are as common in the northern parts of California, as in any other part of America; they are to
CALIFORNIA.

They also pierce their ears, and wear in them trinkets of various kinds and fashions. Their skin is tawny, and their nails of a lighter colour than those of the inhabitants of Chili. At Chili and California the appearance of the beard and the change of the voice announce the age of puberty in girls about their 13th year. The girls attain to puberty about the age of eleven or twelve. These nations have nearly the same passions, the same sports, and the same mode of living; and they are equally violent in the expression of joy and anger, which the slightest occasion is sufficient to excite. Their food is commonly game or fish; and their times of eating are sometimes determined by their appetite; but in general each family assembles at the close of the day to their common repast. The Californians make no use of vegetables, except a few pine-nuts; and other summer fruits, which, however, constitute no essential part of their food. Lillenes makes them abominable, but an abundance tempts, and they become voracious gluttons. These nations are divided into hordes; each of which commonly forms a little hamlet; and their habitations are huts or cabins of different shapes, and constructed of different materials. Polygamy is allowed among them, and their marriages last no longer than is agreeable to both parties. To the exclusive possession of their women they attach little importance, often endeavouring to make a market of their favours, which they sell for a piece of old iron, or a few glass beads. Each family seems to defend a government peculiar to itself; and has its chief, its huts, its causes, its implements for the chase and for fishing, and, indeed, all the various means of defence or subsistence. Some chiefs seem to have the command of several families. These chiefs exel the other inhabitants in stature, strength, and courage; they are generally covered with large furs, as tokens of their valor, and distinguished by a kind of extraordinary decoration in their head-dresses and habiliments. The dres of the women consists of a leathern shift, descendings to the middle of the leg, and a mantle of skins, which covers them from the shoulders to the knees. The men wear a similar mantle, and have a skirt of leather, and buckskin of feel's skin; but their feet are commonly naked. As great changes of temperature are experienced in California at different seasons of the year, the inhabitants are subject to diseases peculiar to the country. Sore throats, catarrh, pleurititis, and pulmonary inconveniences, are the ordinary diseases of the winter season; for which they resort to decoctions made of plants, and applied to the parts affected. Ephemeral and intermittent fevers, and dyspepsia, are chiefly prevalent in spring and autumn; and as remedies they excite vomiting by forcing the finger down the throat, and procure copious sweats by a kind of hot baths. The diseases most general in summer are fevers of various kinds, putrid, petechial, inflammatory, and bilious, together with the dysentery. To one or other of these the patient generally falls a victim, unless the efforts of nature are sufficient to produce a salutary evacuation, by blood, urine, or perspiration. Besides these diseases, the inhabitants of California are liable to nervous fever, rheumatism, prurient eruptions, ophthalmia, syphillis, and epilepsy. Syphillis seems never to have been introduced among the natives of California till after their communication with the Europeans, who settled in that part of the continent. The means of cure in which they most confide are the sand-bath, which they call "tamaefet," and a decoction of sudorific plants taken alternately. The women, though liable to similar maladies with those of the men, suffer little inconvenience during the time of gestation, and are almost always delivered with ease. As soon as the infant is born, the midwives tie the umbilical cord, plunge the child
child into cold water, and cleanse it from the sifid humour with which its body is covered. The moment the mother is delivered, she bathes in the sea or a neighbouring river, and is then seated on a hot floce, and covered with furs. When the sweat subsides, and the flove cools, the plunes herfelf again in cold water, and sometimes repeats this process for several fiecutive days. The time of fifkling is unliited; but it commonly extends to eighteen or twenty months; and the infants are swaddled by wrapping them up in furs, after having previously ftratched out their arms and legs at full length, and fixed them in that situation by feveral bandages of leather. They then place the infant in a piece of bark, proportioned to its size, and of the form of a hollow tile, to which he is fatted by straps or bandages of leather.

As to the religion of the Californians it is not easy to determine concerning it; but it feems most probable that before their intercourse with the Europeans they had no temples, altars, oratories, nor any other place set apart for religious exercifes. No outward profeflion of religion appeared in festivals, prayers, vows, or expiations. It is probable, however, that they had some confused notion of an invisible being; but to what extent their fpeculations carried them, it is impossible to fay, as all our flrst relations concerning them have been transmitted to us by the fiftans and other mifteriaires. In a countiy fo extenfive, and comprehending fo many degrees of latitude, the climate must be very various; and the foil and its productions must depend on collateral circumstances connected with their situation, as it is nearer to the fea and to rivers, or more remote from them. In California, there falls in the morning a great quantity of dew, which, fettling on the rofe-leaves, candies, and becomes hard like manna, having all the fweetnefs of refined fugar, without its whitenefs. In the heart of the country, there are also plains of falt, quite firm, and clear as cryfhal, which, confidering the vast quantities of fish on its coafts, might render it an invaluable acquisition to an induftrious nation. The pearl-fithery on its coafts, and its interior mines of gold, might also supply materials for a profitable commerce. The chief town of California is St. Juan; and the number of its inhabitants has been estimated at 300,000; but every calculation of this kind must be very vague and uncertain. For a further account of this country, and of the western countiy of North America, fee New Albion, Sec also Francois, Francesco. Fur-trade, Monterrey, Nootka, Norfolk Sound, &c. Marchard's Voyage by Fleuret, vol. i. La Pereforest's Voyage, vol. i. and ii.

California, gulf of, called alfo purple, f. white, or red fett, seems to be an effuary of two large rivers, and separates California in part from Mexico. The coafts of the peninusla, towards this gulf, are covered with inhabited iflands; as fuch as thofe of St. Clement, Penas, St. Anne of Cedral, fo called from the number of thofe trees of a large size which it produces, St. Joseph, and a multitude of others. But the iflands well known are three lying off cape St. Lucas, towards the Mexican coaft, which are called Les Trez Marias, or the "Three Marias." These are small, but fupply good wood and water, falt-pits, and abundance of game; and therefore the English and French pirates have fometimes wintered there, when they have been bound on cruifes in the South feas. CALIGA; in Roman Antiquity, was the proper foldier's shoe, made in the fandal fashion, without upper leather to cover the superior part of the foot, though otherwise reaching to the middle of the leg, and felled with thongs. The fole of the caliga was of wood, like the Sabot of the French peafants, and its bottom ftruck full of nails; which cliavi are fuppofed to have been very long in the fhoes of the fcouts and fentinels; whence these were called by way of diminution, "caliga speculatoria"; as if by mounting the wearer to a higher pitch, they gave a greater advantage to the ftight: though others will have the "caliga speculatoria" to have been made foft and woolly, to prevent their making a noise. Phil. Nat. Hist. lib. ix. cap. 13. lib. xxi. cap. 14. Hard. Suet. in Calig. cap. 9. and cap. 52.

From these caliga it was that the emperor Caligula took his name, as having been born in the army, and afterwards bred up in the habit of a common foldier; hence called "Caligatus."

A fort of caliga was alfo worn by monks and bishops, when they celebrated mass pontifically. Du Cange.

St. Jerome (Ad Ennochium, de Cult. Virg. t. 1. p. 140.) ufs the word "caliga" to exprefs that covering for the feet which Chrift forbade his disciples to wear, when he fent them to preach the gospel in his life-time, and which is oppofed to "sandals," Mar. vi. 9.; though St. Jerome, in the impetuofity of his zeal, fuppofes the apoftles to have walked at times absolutely barefoot. These caliga then feem to mean bucklefs, or rather flat boots, designed to cover the feet fo entirely, as to guard them, as well as the lower part of the leg, from injury by ftones, thorns, &c.: whereas fandalis confined merely of foles at the bottom of the feet, falled by leathern thongs, which left the foot very much uncovered, and expoed to injuries. St. Jerome annexes to thefe "caliga" the epithet "late," broad, which does not feem to be appropriate; and, therefore, fome have fuppofed a corruption in the present reading of late for fuses, yellow; and this is the colour of the leather of which the Arabs make their boots.

CALIGATI, an appellation given by fome ancient writers to the common foldiers in the Roman armies, by reafon of the caliga which they wore.

The caliga was the badge, or symbol of a foldier; whence to take away the caliga and belt, imported a difmiffion or cafhiering.

CALIGINOSUS, in Entomology, a species of Callus that inhabits America, the colour of which is black; thorax square and smooth; antennae pitchen. Fabr. &c. Off. This infift is further diftinguifhed by having two impreffed dots on the head.

CALIGO, or Caligatio, in Medicine, an opaqueness, or cloudinefs of the anterior furface of the crystalline, caufing a dimnefs or fuffifion of light. The caligo is the fame with what the Greeks call σκέπακα, avsphs.

CALIGULA, Callus Caesar, in Biography, the fourth Roman emperor, was the fon of Germanicus and Agrippina, born A.U.C. 75, A.D. 12; and derived his furname from "caliga," a kind of military boot, which he wore in conformity to thofe of the common foldiers, and with a view of engaging their affections. At an early period he was a complete mater of difmiffion; he concealed his natural feri- city under an afcribed modesty; nor did he manifest any figns of forrow or resentment, when his mother was condemned, and his brothers were exiled and imprifoned. In his 20th year he was the favorite of the people from the refpect they entertained for the memory of his father; and on this account he was hated by Tiberius. Of this he was very aware; and, therefore, during his adherence with him at Capre, he had recourse to every art for vanquifhing the prejudice which the emperor had conceived again him, and for conciliating his favour. With this view he studied the tales, the humours, the language, and even the tone of voice of Tiberius, changing, as occasions feemed to require, both his countenance and condict, in order to fix his attach-
As regard the power of Sisensus, who had funk in the disposition of Tiberius, and whom he determined to differ, he resolved to advance his obsequious grandson; and having allowed him to assume the "toga virilis," he invited him with the dignity of pontiff, and instigated to the Senate by design of appointing him his successor to the empire. Tiberius, however, well knew the natural ferociousness of his temper; but he hop'd that his passion for music and dance, as well as the debauchery to which he was add'd, would be the means of softening his savage disposition. His hopes indeed were delusive; and he therefore secured the triumphs he would commit, and called him a public poll, that lived to plague him and mankind. To this purpose he described him as "a serpent that would be fatal to the Romans, and a Phaeton that would set fire to the universe."

In a conversation about Sylla, when young Caius ridiculed his character, Tiberius, whose natural penetration led him into a thorough acquaintance with his character, observed to him; "You will have all Sylla's vices, and not one of his virtues." And, on another occasion, when he had his two grandsons before him, he embraced Gemellus, with tears in his eyes, and said to Caius, whose countenance manifested displeasure, "You will slay him, and another shall slay you."

The first wife of Caius was Claudia, the daughter of Marcus Silanus, a senator of distinction; but his chicanery in his youth was such, that he was detected by his grandmother Anna, in scandalous familiarity with his own father-in-law. Upon the death of Claudia, he intrigued with Ennia, the wife of Macro the pretorian prefect, who conversed in this infamous behaviour, and, in consequence of it, affrighted him by his influence in fearing the succession. Although Tiberius, notwithstanding his declared intention, hesitated about the appointment of a successor, information, that he is said by will to have joined with Caius his other grandson Tiberius Gemellus, as co-heir; Caius was acknowledged and proclaimed emperor immediately on the death of his grandfather by the pretorian guards, and Macro was sent to the senate with Tiberius's will in order to have it annulled. In order to accomplish this purpose, he represented, on the part of Caius, that Tiberius was not found in his understanding when he made it, and that this plainly appeared by his appointing a child to govern them, who was not yet old enough to be among them. The senators who hated Tiberius thought these reasons sufficient, and accordingly set aside the will. This event happened A. D. 790, A.D. 37. The sequel of this reign was marked with a variety of transactions, which indicated absolute inconstancy. At its commencement, indeed, it was the occasion of universal joy and congratulation; so that in three months after the accession of Caius to the empire, no less than 160,000 victims were sacrificed in thanksgiving to the gods; and nothing was seen for several months but feasting and rejoicing through the whole extent of the Roman empire. Caius began his reign by several popular acts, which seemed to encourage these high expectations. He professed great respect for the senate, released all that had been imprisoned by the orders of Tiberius, recalled all exiles, abolished for the time to come all accretions of high treason, and put a stop to all proceedings that had already began. He pretended to burn all papers relating to charges of this kind, left by Tiberius; but in the issue it appeared, that, whilst he preserved the originals, he burnt only copies. He also displayed a pious and affectionate respect to the memory of all his deceased relations, and treated those who survived with every token of honour. He discharged all the legacies that had been bequeathed by Tiberius and Livia; and exhibited his generosity, as it was called, in largesse to the people, and public spectacles which were conducted with extraordinary splendour and magnificence. He even affected a regard for liberty, by retorting to the people the right of election to certain offices of which Tiberius had deprived them, and by allowing the works of several patriotic writers to be freely circulated; and with a pretended zeal for morals, he banished all the ministers of the infamous debaucheries of his predecessor. This conduct was in a high degree gratifying to the people; and a dangerous illiberal, with which the emperor was attacked at this period, caused general alarm and produced expressions of concern and wishes for his recovery. As soon as he was restored to his usual health, his conduct appeared to be quite changed, and to mark a character the in it deprived and detestable. The first act by which he discovered his natural ferocity was the death of the young and inoffensive Gemellus; and this was soon succeeded by that of his father-in-law Silanus, and of his benefactors Macro and his wife. Many senators and persons of distinction were also sacrificed to his political jealousy; and others became victims to the mere wantonness of sport, or his innate love of cruelty. Of his inexcusable passion he gave proof by marrying his sister Drusilla, on occasion of whose death he abandoned himself to the perversity of grief. As an instance of his infamy, we may mention his claim of divine honours, together with his institution of priests and erection of temples for the worship of his own divinity; whilst he harried defiance against Jupiter. Similar to this and more extravagant in degree was the honour he paid to his horse "Incitatus," for which he erected a palace, affignd domus, and a public table, and constructed a marble stable and ivory rack, giving him gilt barley and wine out of a golden cup, and swathing by his health and fortune; and, besides, he is said to have designed him for confut. He married and repudiated several wives, and at length his attachment was permanently fixed to Caelonia, who, without youth and beauty, and although she had been the mother of three children by another husband, contrived to engage his affections by a corresponding disdependence of manners. Notwithstanding innumerable enormities, which rendered him the just object of detestation, and for which the only plea might be that of inconstancy, the Roman senate and people disgraced themselves by their base adulation and servile submission. Such was the degree of infatuation and depravity which this monster of folly and iniquity displayed on a variety of occasions, that he seemed to have lost all sense of shame; and to have manifested, without disgrace, his hatred of all human kind. He even lamented that his reign was not distinguished by any of those public calamities, which had happened under his predecessors; and he openly uttered that most execrable with "that the Roman people had but a single neck, which he might cut off at a blow."

His public transactions corresponded in the main tenor of them with his private conduct. In the situation of Xerxes, the eastern despot, he causted to be built, at an immense expence, a bridge of boats across the neck of the bay from Baite to Puteoli. When he had twice triumphantly passed it at the head of his troops, the whole structure was demolished. Resolving on an expedition into Gaul and Germany, he assembled a large army; but having passed the Rhine, and marched a few miles into Germany, he hastily returned, and under an apprehension of danger, which was altogether unfounded, he was conveyed over the heads of the crowd that covered the bridge, and thus reached the other side in safety. On another occasion he caused his troops to found a false alarm, and halfing to the forest from which the noise proceeded...
receded, he employed his men in cutting down trees for erecting trophies on account of his signal victory. After his return he oppressed the province of Gaul with enormous exactions and confiscations, in order to fill his exhausted treasuries. In a pretended expedition against Britain, he marched his whole army to the coast opposite to the island, and having advanced in a magnificent galley to a small distance from the shore, he suddenly returned and ordered a signal of battle to be given; after which the soldiers, who were all loaded at this farce, were directed to fill their helmets with cockle-shells; and the whole ended in a tifling donation to the victorious troops. This folly was succeeded by a very ferocious design of cruelty, which was that of massacring or at least of decimating all the legions of the German army, which had mutinied, in his infancy, against his father Germanicus; but the legionaries, suspecting his intention, took up their arms; and the savage eddy hurried to Rome, and wreaked his vengeance on the paltry nation. His natural ferocity was exasperated by the discovery of a plot, which had been formed against him, for which many persons suffered death, and his murderers were banished and deposed of their property. At length he seems to have relapsed upon the death of the whole senate and principal knights; but his designs were rendered abortive by the resistance of Caligus Cherea, tribune of a pretorian cohort, whom the emperor had made the dupe of his infant agents, and who, it seems, determined to dispatch the monster, and to make an effort for the restoration of a free government. Availing himself of the concurrence of some persons of superior rank, who had been infested and injured by the emperor, a conspiracy was formed, in which Cherea was the principal agent. The games annually exhibited in January to the honour of Augustus were chosen for the scene of execution. While the emperor was passing from the theatre to the palace, in a gallery leading to the baths, Cherea gave him a wound in the neck. The other conspirators then rushed on, and with redoubled blows dispatched the monster, in whose defence no perfon appeared. His mangled body remained on the spot till night, when his wife, or his friend, king Agrrippa, caufed it, half burnt, to be deposited in the earth. In order completely to finish the race of the tyrant, Cherea deputed an officer to put to death his wife Caefonia, and his infant daughter, who was left to redeem her father in ferocity. An universal hatred of the tyrant manifested itself immediately after his death. His statues were demolished, his acts abrogated, and his memory as much as possible extinguished. After a reign of three years and ten months, A. D. 41, Caligula perished, and left behind him a character universally detested. It is said that his form, countenance, gesture, and manner, exhibited traces that were shocking and portentous. Deficiency of natural talents and education, he marred with some degree of diligence to the study of eloquence; but his chief attention was directed to the arts of music, dancing, gladiatorial exercises, and public spectacles. He was capricious and mutable to a degree bordering on madness; and was constant only in preferring some form of vice or extravagance. Sceva observes of him, "that he seems to have been brought forth by nature for the express purpose of showing how much mischiefs could be effected by the greatest depravity, supported by the highest power." Sueton. Dio Calig. Crevier. Gen. Biol.

CALIGUS AERATUS, in Entymology, the name by which Müller distinguishes the species of Monoculus. Piscivorus. The Caligis of this writer confifl of those Monoculi which have the eyes marginal, two fætaceous antennæ, and from eight to ten legs.

CALILAYA, or TAYALAS, in Geogrphy, a province of the island Luzon or Manila in the East Indies, adjoining to Buhay and Cararina, and extending to Bajawa and Boracay, and up the country to Mindanao, on the opposite coast of the island. It is larger than Buhay and is more populous.

CALIMERE. See CALIMINE. CALIMINE. See CALIMERE. CALINER, the name of a sort of mixed metal, seemingly composed of lead and tin. It is prepared by the Chaldees, and they make several utensils of it: a teapot, hammer, coffypot, and the like. In force places also they cover their houses with it, as we do with lead.

CALINACRON, in Ancient Geography, a promontory of Bithynia, at a small distance from the Paruseus. It was called into Mélena.

CALINDA, or CALUNIA, a maritime town of Asia Minor, in Caria; situated on a small navigable river at a small distance from the sea. It gave name to mountains situated on the N.W. of the town.

CALINDIA, a town of Macedonia, in Mygdonia. Also a town of India, on this side of the Ganges. Problem.

CALINGE, in Ancient Geography, a people of India, on the north-west coast, on this side of the Ganges, mentioned by Pliny and pertaining to the Aborigines.

CALINGA, Cangrash, a people of India, different from the former, on this side of the Ganges, whose capital was Parthia. Pliny.

CALINGAPATAM, in Geography, a town of Hindoostan, in the circuit of Cicclee, 12 miles E.N.E. of Cicclee. N. lat. 19° 15'. E. long. 83° 20'.

CALINGHI, in Ancient Geography, a people of Arabia Felix, whose capital was Manabia. Pliny.

CALINGON, Seguara or Ponta de Palmeiras, a promontory of India, on this side of the Ganges, S.W. of the most westerly mouth of the Ganges, on the confines of the country of the Calinge. Pliny places it at 245 miles from the mouth of the Ganges.

CALINI, or Calusvuddi, in Geography, a river of Hindoostan, which joins the Ganges near Canoge.

CALINIPAXA, in Ancient Geography, a town of India, on this side of the Ganges, mentioned by Pliny, and probably the same with Canoge, which fee.

CALONG-CAMPANY, in Geography, a town of the island of Borneo.

CALIORDI, in Ancient Geography, a people of the Tanar Charonda. Pliny.

CALPHI, or Kalm, denotes a successor of Mahomet, vested with sovereign dignity and absolute authority, in the spiritual as well as temporal empire erected by that legislator. The word is originally Arabic, 'Kalif,' which properly signifies a successor or vice. The caliphs among the Mahometans bear a near affinity to the popes among the Chrislians who profess the catholic religion. After the death of Mahomet, who left no directions concerning a successor, or at least none but which were known to his wives, who were in the interest of Omm, very warm debates arose between the Mahanjeen and the Abirsers about the right of electing a kalif. The former claimed that right from their having attended Mahomet in his flight to Medina, and from having declared themselves in his favour before any of the other Arabs joined him; but the latter...
founded their claims on their having supported him, when he was expelled his native city, and in their having enabled him to prevail against his enemies, when he and his followers were in a state of persecution. At length one of the Anfars proposed to compromise this difference by requesting that each of the contending parties might be allowed to choose a khilaf. The proposal, however, was not cordially approved by the Mohajerin; and Abubeker recommended two persons, Omar Ibn Al Khattab and Abu Obeidah, to their choice, and proposed that they should recognize the one of these two persons who obtained the suffrages of both parties. Omar, however, terminated the dispute by swearing fealty to Abubaker, and his example was followed by all the molesms that were present; upon which, Abubaker was elected khilaf by both the Mohajerin and the Anfars, and acknowledged as rightful successor of Mahomet. Abubaker, having been thus elected by the Muharmans, would assume no other title but that of Abubaker nisf Allah, that is, vicar of the prophet, or messenger of God. But Omar, who succeeded Abubaker, represented to the Mahometan chiefs, that if he took the quality of vicar, or successor of Abubaker, the vicar or successor of the prophet, the appellation of vicar would, in course of time, be repeated and multiplied without end; and, accordingly, at the motion of Mokarib, Omar assumed the title of Emir al Mowmain, that is, lord or prince of the believers; which appellation has been accepted and borne by all the legitimate caliphs or successors of Mahomet, from that time; though they still retained the title of caliph, without any other addition.

After the election of Abubaker, Ali Ibn Abu Taleb, who, by hereditary right, ought to have succeeded Mahomet, expressed his dissatisfaction at the choice; but finding that the people in general were pleased in his favour, he acquiesced and opposed his resignation of the government. The Schithas, however, maintain, that the supreme authority, both in spiritual and temporal concerns, rightfully belonged to the descendants of Ali, and they do not acknowledge the three first successors of Mahomet, viz. Abubaker, Omar, and Othman, as legitimate. The government of Abubaker commenced in the year of the hégira 11, A.D. 622; and terminated A.D. 634; when he was succeeded in the regal and pontifical dignity by Omar. This caliph, before his decease, appointed 5 persons to deliberate concerning the election of a successor; all of whom had been intimately acquainted with Mahomet, and were exalted, by way of eminence, his "Companions." After his death they assembled for the choice of a new caliph: and Abdallrahman renounced his pretensions on condition of being allowed to nominate one of the 5 remaining companions as emperor of the faithful. To this proposal all agreed except Ali, who thought himself injured, because he was not the immediate successor of the prophet; and Othman was declared caliph, in the 22d year of the hégira, A.D. 644. Upon the death of Othman, Ali was unanimously elected to succeed him, in the 35th year of the hégira, A.D. 655. The feat of government during the 3 preceding caliphates had remained fixed at Medina from the death of Mahomet; but Ali removed it to Cufa. Ali was succeeded in the caliphate by his son Hafan in the 40th year of the hégira, A.D. 666; but after a reign of about six months, he abdicated the government, and was succeeded in the 41st year of the hégira, A.D. 667, by Moaiyiah I. the first caliph of the house of Ommayah; who transferred the seat of government to Damascus in Syria. The race of Omahydeas terminated with Mawwa II. in the 257th year of the hégira, A.D. 744; and was succeeded by the Abasphides. The first caliph of this family was Abul Abbas al Saffah, who ascended the throne of the Moflems in the 124d year of the hégira, A.D. 749, and who removed the seat of government from Cufa, to Anbar, a city on the confines of Chaldes and Arabia, and last of all to Hafcheniyah a city built by himself near the Euphrates, not far from Anbar, and so denominated in honour of Hafchen, uncle of Mahomet, and one of his ancestors; and from this circumstance the Abasphides obtained the appellation of Hafchmantes. Abul Abbas was succeeded by his brother Abu Jaafar al Manfar, who was proclaimed caliph in the imperial city of Anbar, then the capital of the Moflem empire, in the 138th year of the hégira, A.D. 754. He built the city of Bagdad, which afterwards became the customary residence of the Abbaside caliphs, his successors. This race terminated with Al Mo'ta'lem Billah, who was put to death by the Tartars, in the year of the hégira 656, A.D. 1258, when they captured the city of Bagdad.

At the end of the first century of the hégira, about A.D. 718, the caliphs were the most potent and absolute monarchs of the globe. Their prerogative was not circumscribed, either in right or in fact, by the power of the nobles, the freedom of the commons, the privileges of the church, the votes of a senate, or the memory of a free constitution. The regal and facerotal characters were united in these successors of Mahomet; and the Koran was the rule of their actions. They were the supreme judges and interpreters of that book held to be divine. They reigned by the right of conquest over the nations of the earth, to whom the name of liberty was unknown, and who were accustomed to applaud in their tyrants the acts of violence and severity, that were executed at their own expense. Under the fall of the Omamides, the Arabian empire extended 200 days' journey from east to west, from the confines of Tartary and India to the shores of the Atlantic Ocean. And if we retrace the sleeve of the robe, as the long and narrow province of Africa was fyled by their writers, the solid and compact dominion from Fargana to Aden, from Turfan to Sura, will spread on every side to the measufe of 4 or 5 months of the march of a caravan. Under the reign of the Omamides, the studies of the Moflems were confined to the interpretation of the Koran, and the eloquence and poetry of their native tongue. But the caliphs of the race of Abasphides, after their civil and doméstic wars, encouraged literature and science. See ALMAHON and ALMAHANOR.

After the period of the destruction of the caliphate by the capture of Bagdad, there were persons who claimed the caliphate, under a pretence of belonging to the family of the Abasphides, and to whom the sultans of Egypt paid great respect at Cairo, as the true successors of Mahomet; but this honour was merely titular, and the rights they claimed were only acknowledged in the province of religion; and though they bore the title of caliphs, they were nevertheless subjects, and dependents of the Sultans. In the year of the hégira 361, A.D. 971, a kind of caliphate was erected by the Fatimites in Africa and Egypt, and revolted till Saladin suppressed it by order of Troureddin, sultan of Syria. There was also a caliphate in Africa and Spain, which commenced under the reign of Josef. Historians also speak of a caliphate in Yemen or Arabia Felix, established by some princes of the race of the Anabouites, or Jobites. The emperors of Morocco assume the title of "grand chers" and pretend to be the true caliphs, or successors of Mahomet, though under another name. Since the
the destruction of the caliphate, the Mahometan princes have a particular officer appointed in their respective dominions, who sustains the hereditary authority of caliph. In Turkey he is denominated Mufti, and in Persia Sadie.

One of the principal functions of the caliph, in quality of Imam or chief priest of the Mahometan religion, was that of beginning the public prayers every Friday in the chief mosque, and of delivering the kotobah, which was a kind of sermon. In later times they had deputies or officials who performed the second service; but the first was always appropriated to the caliph in person. He was also obliged to conduct the pilgrims to Mecca, and to march at the head of the armies of his empire. The caliphs also granted letters-patent of investiture, as well as froward, standards, robes, &c. to the Mahometan princes, who, though they had thrown off the yoke of the caliphate, nevertheless held of it as vassals.

The caliphs usually went to the mosques mounted on mules; and the sultans Seljucides, although masters of Egypt, held their litters, and led their mules by the bridle for some distance on foot, till such time as they received intimations from the caliphs to mount on horseback. At one of the windows of the caliph’s palace, there always hung a piece of black velvet, 20 cubits long, which reached to the ground, and was called the “caliph’s sleeve;” and the grandees of his court never failed to kiss it with great respect every day. The honours paid to the caliphs were exorbitant, and produced in them a degree of pride, of which they did not attempt to exhibit tokens, even when their authority had declined and was reduced to its lowest state of degradation. In the period of their power, they affected very extraordinary magnificence and splendour. Abulfaragius relates, that the caliph Motzam had 700 women in his harem, and 300 eunuchs to guard them. But this splendour was much diminished, and, indeed, almost annihilated during the reign of the Bouides in Persia, who stripped them of every thing, depriving them of their viands, and allowing them to retain no officer of higher rank than a secretary to take care of their affairs. At length, and particularly under the reign of Radi Bilbah, the 25th caliph of the Abassides, A.D. 924, the territories of the Mahometan empire were so dismembered and divided, that this caliph was reduced to the sole dignity of the caliphate, and the possession of the city of Bagdad. But Baffora, Vafith, and Alouass, were under the dominion of the Bouides. They occupied the whole of Peria; the Hamadanites reigned in Mosul and Mesopotamia; Alkheid was master of Egypt and Syria; the Fatimites possessed Africa; the Omnipredes governed Spain; the Samanides had Khorasan; the Cannatha were in possession of Persia, and, moreover, the Dilemites were the sovereigns of Georgia and Tabidian. Such was the state of the caliphate in the 335th year of the hegira, A.D. 936. After the Bouides made themselves masters of Bagdad, they were reduced to the mere exercise of the functions of the mosque; and these princes advanced or dethroned them at their pleasure. At length, the period of their total overthrow by the Tartars, under the caliphate of Motzam, arrived, as we have already related; and their temporal power became extinct. Herbelot, Bib. Or. Gibbon’s Hist. vols. ix. x. xi. Mod. Uni. Hist. vols. i. ii. iii.

CALIFOS, or CALIF, in Ancient Geography, Sadus, a river of Lusitania, which rove to the south of the mountains on the northern boundary of Cuncus, and running northwards, watered the town of Salaria, and then turning to the west, discharged itself into the sea.

CALIPPIA, an island of the Aegian Sea. Anton. Marit. R. T.

CALIPPIC period, in Chronology, a series of seventy-six years, perpetually recurring; which elapsed, the middle of the new and full moons, as its inventor Calippus, an Athenian, imagined, returns the same day of the solar year.

Meton, a hundred years before, had invented the period, or cycle, of nineteen years (see Metonic Cycle); assuming the quantity of the solar year 365.256.5; and the lunar month 27'.3. The period, or cycle, of nineteen years, was not exact, but only a period of 76 years, called the Calippic.

At the end of this term it was necessary to retrench a day: so that his period was composed of four of those of Meton, three of which consisted of 6940 days each, and one of 6939 days. For this purpose, it was sufficient to change in the revolution of four periods one of the months from 30 to 29 days. The effect of this correction was to retard the anticipation of the new moons for more than 300 years, and at the same time to render the whole period more correspondent to the motion of the sun. The Calippic period, therefore, or the interval of four Metonic or lunar cycles, diminished by a day, contains 27535 days, and since the lunar cycle contains 2739.5 lunations, and the Calippic period is quadruple of this, it contains 9460 lunations, equalling of about 27753 days 18' 9", and 67 revolutions of the sun compose a term of about 27738 days 10' 4". The Calippic period began in the third year of the 112th olympiad, or the 438th of the Julian period, B.C. 355, the 7th year of the 10th Metonic cycle. It is demonstrated, however, that the Calippic period itself is not accurate; that it does not bring the new and full moons precisely to their places: 8' 5' 52" 65", being the excess of 910 lunations above 76 solar years; but brings them too late, by a whole day, in 225 years.

This period was adapted by astronomers, and is frequently mentioned by Ptolemy. It corresponds to our lunar cycle, combined with our Julian years, 76 of which form the Calippic period; and the anticipation of the moon is the same in both. This anticipation, together with that of the equinoxes, gave rise to the reformation of the calendar, A.D. 1582. See Calendar. The ancients were not unacquainted with the doctrine of the Calippic period; at least, it did not escape the penetrating faculty of Hipparchus, who undertook to correct it. His observations led him to perceive, that the solar and lunar years were somewhat less than Calippus had supposed them to be, and pursuing his calculation, which he conceived to be sufficiently exact with regard to the moon, but more erroneous with respect to the sun, he found that the anticipation of the one and of the other was about a day in four periods. He therefore quadrupled the cycle of Calippus, and retrenched from it the day which he had found in excess during four revolutions. This new period had the advantage of corresponding more exactly with the motion of the moon, which was not retarded more than half an hour in 304 years. But it anticipated the motion of the sun about a day and a quarter, which was an error only equal to that of Calippus in a double interval. However, this invention shored the fate of many others, no less useful and able neglected. The Greeks, accustomed to the cycles of Meton and of Calippus, disregarded that of Hipparchus, although it was more perfect.

CALISIA, in Ancient Geography, a town placed by Ptolemy in the easter part of Germany, and supposed by Cluver to be Kilch in Poland.

CALISPERNUM, in Botany, (καλισπέρνοα, beautiful, and

PALPHORE

A certain, in Ancient Geography, a people of India on the other side of the Ganges. Play.

CALISTA, in Anthology Hist., the daughter of Ly-

cam, king of Arcadia, and one of the nymphs of Dana.

Bearing beloved by Jupiter, he assumed the form of the god-

ess of chastity, and thus debauched her; but whilst she

was nursing with her paramour, his disgrace was revealed,

and the incensed deity converted her and the son with whom

she was pregnant into bears; upon which Jupiter, as the

fable reports, commissariating her sufferings, took them up

into the heavens, and made them the constellations Ursa Ma-

jor, and Ursa Minor.

CALISTE, in Conchology, a species of Venus,

the shell of which is bifit with acute transverse dries, becoming

membraneous in front; anterior flaps short, and the posterior

epitrans inconspicuous. Genel. Schreher. &c. inhabits the

Red Sea.

CALITE, in Ancient Geography, a people of Africa in

interior Libya. Play.

CALITOOR, in Geography. See CALITU.

CALITUR, in Ancient Geography, an island in

peaced by Ptolemy on this side of the Ganges.

CALIT. See CALIS and CHAS.

CALITUS, in Ecclesiastical History, a name given to

those among the Lutherns, who follow the sentiments of

George Calista, a celebrated Luthern divine, who was

born near Slewick in Holstein, in 1566; and having

studied at most of the protestant schools in Germany, was made

professor of theology at Helmildt in 1614, where he died

in 1656. He was distinguished by his zeal for forming an

union between the Romish, Lutheran, and Reformed

churches, and, at least, for joining them in the bonds of

mutual forbearance and charity. Calista was the first

reformed theology into a regular system, and gave it a

truly scientific and philosophical form. As he had imbied

the spirit of the Aristotelian school, he arranged the sub-

stance of Christianity according to the method of the Stag-

rites, and divided the whole science of divinity into three

parts, viz. the end, the subject, and the means. He was

also the first who separated the objects of faith from the de-

sires of morality, and exhibited the latter under the form of

an independent science. These innovations rendered him

the object of much cenrifice and opposition. In his attempt

to unite the several bodies of Chrissians, and to compromise

the different churches in one profession of religion, he was

a principal promoter of that system, which was called

yneterism. See SYNERGETICS.

The controversy which was thus occasioned, filled his af-2

and, though he found, in his efforts for comprehension, to
give advantage to the Romish church, no one attacked its

principle and corruption with greater vigour. He was the

author of many works, which it is now needful to enumerate,

Mosheim, Eccle. Hist. vol. v.

The Calistus are esteemed a kind of semi-Pelagians.

Calitutus also denote a fel in Bohemia, derived from

the Hebrews, in the fifteenth century, A.D. 1470, who

affected the use of the cup as essential to the eucharist.

And hence their name; which is formed from the Latin calis,

a cup.

The Calistus are not ranked by Romans as in the list of

heretics, since in the main they still adhered to the doctrine

of Rome. The reformation they aimed at terminated in the

four following articles.

1. That the word of God should be explained to the people

in a plain and perspicuous manner, without the mixture of

superficial comments or inventions.

2. That the sacrament of the Lord's supper should be administered in both

kinds.

3. That the clergy, instead of employing their attention and zeal in the acquisition of riches and power, should turn their thoughts to objects more fit to their profession, and be ambitious of living and acting as became the successors of the holy apostles.

4. That transgressions of a more heinous kind, or "mortal sins," should be punished in a manner suitable to their enormity.

In the two great factions of Calistus and Taborites, into which the multitude was divided, there were some subordinate sects, who differed in several other points. Mosheim, Eccle. Hist. vol. iii. See Taborites.

CALIXTUS, G. See CALIXTINS.

CALI YUG, in the Astronomer of the Hindoos, a period of time.

The commencement of which forms an epoch, in which the planets were supposed to have been in a line of mean conjunction, in the beginning of Aries. The Cali

yug is supposed to have begun 3175 years before the commencement of the Christian era, or 3175 years before the

year of Christ's birth; or at the instant of midnight, be-

tween Thursday the 17th, and Friday the 18th of Febru-

ary, O.S. in the year of the Julian period 1612, when the

planets were supposed to have had this aspect on the merid-

ian of Lanka, about 75° 50' E. of Greenwich; and the

epoch founded on its commencement appears to have been

fixed on by Varaha, the reputed author of the Surya Sidd-

anta, and some other Hindu astronomers since his time;

for though the planets were not then actually in a line of

mean conjunction, yet, the differences between their re-

spective positions, and that which was assumed, when di-

vided among the years expired from that epoch to the time

of Varaha, were considered as too small to cause any con-

siderable difference between the mean annual motions, and

doing which it would be necessary to assume, so as to give

the positions of the planets at that time, or even to cause

any sensible error in their computed places deduced from

them for many years. For a farther account of this astro-

nomical cycle, and its application to the Hindu chronology,

see Bentley on the Antiquity of the Surya Siddanta, in the

Ariatic Researches, vol. vi. p. 540. See also

SURYA SIDDANTA.

CALKA, in Geography. See KALKA.
CALLING, or Caulkins, in Sea-Language, &c. See Causing.

Calking, in Painting. See Calking.

CALKINS, or Caulkins, a part prominent from a horse-shoe, intended to secure the healt from flying. The calkins are the end or extremity of horse-shoes, turned or bent downwards, and forged to a foot of point, to make the hoof step more safe and steady on the ice. The inconvenience of calkins is, that they hinder the horse from treading evenly on the ground, and thus occasion wreathes on the foot, or drawing in the fines: especially in heavy ways, where the horsefeet of the bottom will not suffer the calkins to penetrate: besides, they are apt to make a horse cut.

Calkins are either single or double, i. e. at one end of the shoe, or at both: the latter are reputed less hurtful, as they allow the creature to tread more even; some are made large and square; the ball are in form of the point of a hare's ear.

CALK or Calf, means the noise or cry of a bird, especially to its young, or its mate in erupting time.

The call of a bird, says the hon. Disraelo Barrington, in his Experiments, &c. on the Singing of Birds (Phil Trans. vol. liv. p. 290), is that which is used when about a month old: it is, he says, in many instances, a repetition of one and the same note, is retained by the bird as long as it lives, and is common, generally, both to the cock and hen.

One method of catching partridges, is by the natural call of a hen trained for the purpose, which drawing the cock to her, gives opportunity for entangling them in a net.

Calls are also a sort of artificial pipes, made to catch several sorts of birds, by imitating their notes. Different birds require different sorts of artificial calls; but they are most of them composed of a pipe or reed, with a little heathen bag or purse, somewhat in form of a hollow, which, by the motion given thereto, yields a noise like that of the species of bird to be taken. The call for partridges is formed like a boot, bared through, and fitted with a pipe, or swan's quill, &c. to be blown with the mouth, to make the noise of the cock partridge, which is very different from the call of the hen. Calls for quails, &c. are made of a heathen purse in shape like a pear, stuffed with horse hair, and fitted at the end with the bone of a cat's hare's, or coyn's legs, formed like a flageolet: they are played by squeezing the purse in the palm of the hand, at the same time striking on the flageolet part with the thumb to counterfeit the call of the hen quail.

In some countries hares are very numerous, and from May until August are taken with a call, which entices them within a proper distance of the sportsman. This call is a squeaking sound, first low and then quicker, and is supposed to resemble the call between the male and the female. In the country about Naples, where this practice obtains, both hares and partridges are so tame, that they will run under the carriage-wheels.

CALL, in Hunting, signifies a lesion blown upon the horn, to comfort the hounds.

CALL, in Mineralogy, an English name for the mineral called Tunflin, or Wolfram, by the Germans.

CAl, in Sea language, a sort of whistle or pipe, of silver or brass, used by the boatwain and his mates to summon the sailors to their duty, and direct them in their several employments. It is founded to various strains, adapted to the different exercises, as hoisting, heaving, &c. and the piping of it serves the same purposes among sailors, as the beat of the drum among soldiers.

CALL, in Hunting, a word used in a parliamentary sense, to discover whether there be any in the house not returned by the clerk of the crown; but more frequently to discover what members are absent without leave of the house, or till called.

In the former case, the names of the members being called over, every person answers to his name, and departs out of the house, in the order where he is called. In the latter, each person stands up uncovered, at the mention of his name.

CALL, in Botany, (derived, according to some authors, from capo, heavy; but profusor Martyn says, from calamus, the wattle of a cock; the same occurs in Paris.) Lin. gen. 1230. Schreb. 1358. Gent. 522. Jull. p. 24. Vért. vol. II. p. 35. (Provenza.) Ch. and other greenish-plyamindia, Linnaeus, monocotyledonaria, Schub. plantae polyandria, Dr. Smith, as appears from his remarks on Arum in his Flora Britannica, and English Botany. Nat. ord. piperaceae, Lan. Arch. July and Ventenat.

Gen. ch. Cal. spathe one-leaved, acuminate, spreading, permanent; spadix simple, erect, covered with frutifications. Cor. none. Stam. either placed above or intermingled with the pistils; anthers filiform, truncate. Pet. germ roundish obtuse; styli simple, very short; stigma acut; with several permanent, compressed, truncate filaments intermixed with the germs. Peric. berry tetragonal-globular, one-celled (many celled, Gersd.); seeds from six to twelve, erect, cylindrical, obtuse at both ends.

Sp. 1. C. eliptica, Lin. Sp. Gartner, Tab. 84. fig. 2. La Marck, PI. 72. fig. 2. (Arum ethiopicum; Comm. hort. I. p. 97. Tab. 30. Arum Africanum; Turner. 159. R. Sp. 56.) "Leaves arrow-heartshaped; spathea cowled; pistils placed above the pistil." Perennial. Root thick, fleshy, with a brown skin, and strong, fleshy fibres. Leaves in clusters from the root, eight or nine inches long, of a shining green, ending in a sharp point, which turns backwards, and pinnules more than a foot long; narrowed, and fleating at their base. Spike longer than the leaves; round, herbaceous, smooth, green. Spathe white, a little fleshy, twisted at the bottom, but spread open at the top, suddenly contracting, and ending in a point. Spadix cylindrical, yellow, about half the length of the spathe. Stigmas above, filaments below set to close together so that they are not easily distinguishable. Seeds roundish, dark brown, smooth, having on the inner side a protuberant, compressed eye extending from the umbilical aperture to the top of the seed. Miller, La Marek, and Gartner. A native of the Cape of Good Hope, first to Commelin in 1687, and cultivated by Mr. Miller in 1731. The flowers from January to May. 2. C. polydorus, Lin. Sp. PI. Flor. dan. Tab. 432. (Draecena) palatini, Bakh. pin. 197. D. aquatica. D. p. 331. R. Hort. 1210. Bork. i.e. 71. Anguina aquatica, L. & C. 602.) "Leaves heart-shaped; spathes flat; pistils and filaments intermingled with each other." Perennial. Root creeping, from six to eighteen inches long, fixing itself to the earth by capillary fibres from its roots, and throwing out leaves and saccas at different distances. Leaves petioled, acuminate, green, smooth, alternately ascending the stem. Spikelets two, bluntish-egg-shaped at the base of the pistillate. Spike round, thick, succulent, smooth, bright green. Spathe roundish-egg-shaped, rolled up at the end into a bluntish spine, yellowish-green below, white and smooth above. Spadix egg-shaped, obtuse. Stigmas white.
Baxter small, four or five-cornered, or round, wrinkled about the edge, smooth, flat, flat at the top, crowned with a short style. "Snete from six to nine, sometimes only from one to three, in a vivid muscade. A native of maries in Holland, Germany, and the whole north of Europe. Its roots are very acid; but Linnaeus informs us, that the Lapplanders extract from them a food of which they make bread. 1. C. orientalis, Linn. Sp. Pl. (Arnau Carfani, Rauw. itn. ii. 112. A. nissus orientalis, Mor. Hort. 3.44. "Leaves egg-shaped." Perennial. Petals long. Stems about six inches high; flower white. A native of the mountains about Aleppo. This species yields entirely on the authority of Rauwolf; and, though admitted by Linnaeus into his Species Plantarum, does not appear in the last edition of his Systema Naturae, and has since been rejected by most of the editors of the Systema Vegetabilium. 2. C. sativa, Mutin's Miller. Louisco Coehlich. 432. "Leaves heart-shaped, flat, with slender peduncles; peduncle about twice as long; flowers with slender peduncles, dilated at the base, embracing the inner ones. Stems long, containing the flowers even in their state of maturity. Spadix oblong. Sigmas concave, tupid, feline. Berry three-lobed, three-angled, yellow, containing many seeds. A native of Cochinchina in moit places. Propagation and Culture. The Æthiopica propagates very fast by offsets, which should be taken off about the end of August, and each planted separately in a pot filled with kitchen-garden earth. They may be kept in the open air till winter, and then should be removed under cover. The plant will live in the open air in mild winters, without any cover, in a warm border and dry soil; and may always be prefered with a little shelter from hard frosts. The paludina must be planted in an artificial bog, or the mud of a pond, or tub fed in water. Miller. CALLA-Syng., in Geography, a town and capital of the island of Bouton, in the Indian sea, celebrated about a mile from the coast, on an eminence surrounded with cocoa-nut trees. It has a good harbour with a rocky bottom. The inhabitants are Mahometans, and speak the Malay language. CALLABASH-BAY, See CALLABASH. CALLAC, a town of France in the department of the North Coasts, and chief place of a canton in the district of Guingamp; 15 leagues N. of Rore. The place contains 1,353, and the canton 10,532 inhabitants; the territory includes 327.5 kilometres, and 9 communes. CALLACALLES, a river of Chili which falls into the South Sea at Baxlia. CALLAF, or CALL, in Botany. (Alpin.] See Salix Ægyptiaca. CALLAH, or GELLAH, in Geography, a town of Africa, in the country of Algiers, 50 miles S. of Dona.-Alfo, a town of Africa, in the country of Algiers; 35 miles W. of Sef. CALLAH, Ez., a town of Africa, in the western province of Algiers, Tlemfan or Tremeen, situate 5 leagues to the N. E. of Mafcar, and 40 miles E. of Oran, on an eminence, as the Arabic name imports, and in the midst of other mountains, which form part of Mount Atlas. It is larger than Mafcar, but a dirty ill-contrived town, without drains, pavement, or causeways. It is the greatest market of this country for carpets and burnoores. There are several villages of the same name, and alike situate round about it, all of which are profitably employed in the same woollen manufactures. The Turks have here a small garrison and citadel; and, from some few large houses and pieces of marble of ancient workmanship, we may infer that it was formerly a city of the Romans; perhaps the "Gitili," or "Apars," of Ptolemy. CALLACI, or CALLICI, in Ancient Geography, a people of Spain, who inhabited the north-western part of the country. Their name seems to have been formed from "Calis," which was that of one of their ports. There were severa different people comprehended under this denomination; such as the Bracarri, Celarierii, Gravii, Simici, Quequerenri, Artabri, and others. Ptolemy divides them into "Callaci Bracarrii," and "Callaci Lucensis." The former extended themselves from the Dourias to the Minis; and the latter from the Minis to Aures. Their principal rivers were the Uia, Minus, and Durius; and their chief towns were Brigantium, Adroicium, Lucas Augusti, Iria Flavia, Tydes, Bracara Augusta, Calle, and Aque Flavia. CALLAN, a mountain in the county of Clare, Ireland, near the Welbed Ocean, remarkable for a large stone or monument, supposd to have an inscription in the Ogham or Osym characters. An account of it may be found in the 11th vol. of the Transactions of the Royal Irish Academy, and in the 7th volume of the Archaeologia; and some remarks on it in Leflitch's Irish Antiquities. CALLANORE, or KILLANORE, a town of Hindoostan, in the county of Lohore, feated on the Rauvee, about E. 30° N. from Lahore, or distant 1,300 miles common coffes, N. lat. 33° 30'. E. long. 74° 40'. CALLAO, a sea-port town of Spanish South America, in Peru, feated on a river of the same name near the Pacific Ocean, and serving as a port to the city of Lima, from which it is distant about 5 miles. The harbour of Callao is the largcst, most beautiful, most convenient, and most secure in the South Sea; and the Spanish government has, at different periods, expended large sums in improving and strengthening it. The largest vessels may lie with perfect safety in the road of this port, as the water is very deep, without rocks, and always tranquil. Two islands, named St. Lawrence and Callao, and the peninsula which nearly reaches them, defend vessels, from the south wind; and though the road is open to the north and north-north-west, the winds blow seldom blow here, or with such incon siderable force, that no danger is apprehended. The island of St. Lawrence breaks off the sea from the S. W. to the E. In this port every necessary commodity which vessels need may be procured. The small river that comes down from Lima, and discharges itself into the sea under the walls of Callao, furnishes plenty of good water; and a mole, on which cranes are erected, makes it easy for ships to load and unload. The town, which the Spaniards have considered as almost impregnable, was, before the calamity, which it suffered by an earthquake, fortified by batteries and some batteries, which have never been thoroughly repaired; and it is defended by a garrison. There are two faubourgs inhabited by Indians. The trade of Callao is considerable, in consequence of its convenience as a port, and its vicinity to Lima, which lies. This place, as well as the adjacent country, has frequently suffered much from earthquakes. The most dreadful earthquake, however, seems to have been that which commenced in 1746, and continued at intervals till 1757. On this occasion the port of Callao was totally submersed; nothing remained except a piece of the wall of the fort of Santa Cruz, as a memorial of this terrible devastation. Of 23 ships and vessels, great and small, which were then in the harbour, 19 were wholly sunk, and the other four were carried by the force of the waves to a great distance up the country. Of the number of inhabitants, amounting to about 30,000.0
CALLAO, as it is called by its inhabitants, but more generally known to Europeans under the name of CAMPPELLO, is an island which lies opposite to, and about 8 miles to the callward of, the mouth of a confiderable river on the coast of Cochina-china, on the banks of which is situated the town of Fairfoo, a place of some note, not far from the harbour of Turon. The bearing of the highest peak of Callao from this harbour is about S. E. at the distance of 30 miles. The extreme points of the island lie in N. lat. 15° 35', and 15° 57'. The greatest length is from N. W. to S. E. about 5 miles, and the mean breadth 2 miles. The only inhabited part is on the S. W. coast, on a rip of ground rising gently to the cafl, and contained between the bottom of a fea bay, and the mountains on each side of it. These mountains, at a distance, appear like two distinct lands. The southern mountain is the highest, and is about 1500 feet. The inner grounds contain about 200 acres. This small but enchanting spot is beautifully diversified with neat houses, temples, bangs of trees, small hillocks swelling from the plain, and richly decorated with shrubbery and trees of various kinds, among which the elegant arbor, rising like a Corinthian column, is eminently confpicuous. A rift of clear water, oozing from the moun- tains, is carried along the upper ridges of the vale, whence it is occasionally conveyed through sluices, for the purpofe of watering the rice grounds, and for which it seems to be ample sufficient. The houses, in general, were clean and decent: a few were built with stone, and covered with tile. One, probably the mansion of the chief fennon of the island, was inclosed by a stone wall, and the access to it was through a gate-way between two stone pillars. The house was divided into a number of apartments, arranged with fafety and convenience. This building stood at the head of the principal village, consisting of about 30 habitations built of wood, chiefly the bamboo. Behind the village, and on the side of the hill, was a cave, accessible only by one path through a range of rocks; and within the cave, near its mouth, was a small temple, commanding a view of the whole vale. Several other temples were difpofed over the plain, all of which were open in front, with a colonnade before them of round wooden pillars, painted red and varnished. The number of houses on the island scarcely exceeded 60. Behind every house, not immediately in the principal village, were inclosures of sugar-canes, tobacco, and other vegetables, improving in great luxuriance. The mountains were covered with verdure and seemed well calculated for rearing goats, of which the island produced a few. Before the principal bay, there were several sandy inlets, in any of which boats might easily land; but a communication between them by land is very difficult, if not impracticable, on account of the steep and rugged ridges which separate them from each other. Hence it appears that very flight works, and an establishment of a few men would be sufficient for the defence of the island; a great part of its coast being impregnable fortified by nature. The depth of water in the bay and road is sufficient for ships of any burden, and it affords perfect shelter from every wind except the S. W., to which quarter it was directly open. The French, it is said, aware of the insecurity of trading to Tung-quin and Cochinn-china without some independent settlement, had formerly in contemplation to purchase the small island of Callao, lying a few miles to the southward of Turon. But the want of shelter in the S. W. monfoon would soon induce them, if they were once in possession of Callao, to seek for a further settlement near it, upon the main-land of Cochinn-china. Emboldly to China, vol. 1.

CALLARIAS, by some called affelles callarias, in botany, a fift of the traccusses kind, called by Aldrovan- dus times marina, and by Rondeletius and Gower phyfius. It usually grows to about a foot in length, and is in shape something flattish; it is covered with small scales, and is of a greyish colour, but somewhat purple on the head; its tail is roundish, not forked; it is a very well tast'd fish, and is common in the Mediterranean, and brought to market at Rome, Venice, &c.

CALASAN, in Ancient Geography, a river of Greece, in the island of Eldoca.

CALLAS, in Geography, a town of France, in the department of the Var, and chief place of a canton in the district of Draguignan, 11 league N. E. of it. The place contains 21,505, and the canton 8,186 inhabitants; the territory comprehends 2729 kilometres, and 5 communes.

CALATIIS, and CALLANTIIS, in Ancient Geography, a people of India, who have the custom, according to cro- dotus, of eating their parents.

CALATIS, CALLATIS, or CALANTRA, a town situated on the westem coast of the Lusine firth, south of the mouth of the Ifer, and 300 fathoms distant from Tonn. See Callatis.

CALLE, JOHN FRANCIS, in Biography, a French mathematician, was born on the 25th of October 1744; at Verfailles, where he received a good education, and acquired an early taste for the mathematics. In 1768 he came to Paris, where he had an opportunity of being more thoroughly instructed. In 1774 he formed some distinguished pupils for the school of engineers, where the examinations were strict, and admission difficult to be obtained. In 1779 he gained the prize proposed by the Society of Arts at Geneva, for efeojments. In 1783 he completed his edition of "Gardiner's Tables of Logarithms," which were exceedingly convenient, of great utility, and very correct; and which possessed advantages above all the others. In 1786 he was appointed professor of hydrography at Vannes, afterwards at Dunkirk, and in 1792 he returned to Paris, and was for a few years professordes ingénieurs géographes at the depot of war. This public having been suppressed, he continued to teach in Paris, where he was always considered as one of the best mathematical masters to whom pupils could apply.

In 1792 he published the new stereotype edition of the "Tables of Logarithms," considerably enlarged with logarithmic tables of the sines, according to the new decimal division of the circle. These are the first which ever appeared. Towards the end of 1797 he presented to the National Institute the plan of a new telegraph and a telegraphic language, accompanied with a dictionary of 1,000 French words adapted to it by a combination worthy of a able mathematician.

These labours had injured his health; he had been a long time athmatic, and, notwithstanding his condition, he published, that year, an excellent memoir on finding the longitude at sea, under the modest title of A Supplement to the Trigonometry and Navigation of Buzor. He died on the 14th of November 1798, leaving behind him a daughter, born at Vannes in 1797. According to a tradition in the family, he was defended from Dfeartes. La- lande's Hilt. Alton. for 1798.

CALLE, in Ancient Geography, Porto, a town of Hip- nia Citerior, to the south, near the mouth of the river Du- nus, on the frontiers of Lusitania. This town, at first a small port, became afterwards considerable among the Cal-
that, to whom it belonged. It is now called Puerto by the Portuguese, and Porto-Po, or Porto by the French. From this name Calla, and that of Porto, the appellation of Portugal is said to have been derived.

Calle, i.e. in Geography, a town of Africa, in the province of Callian, surrounded on three sides by the sea, and defended on the fourth side by a strong wall. This place is inhabited by 3,000 Christians and Moors, and is the chief factory of the French African company on this coast. The stores belonging to the company are the only regular buildings; the rest of the inhabitants, composed of the family of the populace of Marfellis, live in wretched huts. They are employed in packing and un-packing of goods, in the coral fishery, and in taking care of the cattle; they likewise perform military duty, and daily mount guard. Besides the advantage of the coral fishery, and of the whole trade of the circumjacent country, the French have also at Boma, Tuckuf, Siggaga, and Call, the monopoly of corn, wool, hides, and wax; for which they pay yearly to the government of Algiers, to the kahle of Boma, and to the chiefs of the neighbouring Arabs, 30,000 dollars, i.e. about 500 guineas of our money.

Callæa, a name anciently given by the Spaniards to the Abipons, on account of their singular practice of eradicating the hair over their foreheads, so as to produce the appearance of baldness: but their features resemble the European, and the nose is commonly of an aquiline form. They carefully eradicate the beard, and mark their foreheads and temples with particular fears, by way of ornament. The males are accustomed from childhood to the use of the bow. Hunger alone dictates the time to eat; and they consume vast quantities of animal food. They prefer clean air to frequent bathing in the lakes and rivers. They have no idea of a monarch, but are ruled by many caciques, which they call "capitas," from a Spanish term. They seldom marry till the husband and bride have exceeded their twentieth year; and the lady is purchased from her relations at the price of four horses, and woollen cloths of various colours, somewhat resembling Turkey carpets. They pretend to expedite the birth by a mixture of cabbage juice and wine; and on the birth of a cacique's eldest son they observe many ceremonies. They chiefly bury their dead under the shade of trees; and the horses of a chief or warrior are sacrificed on the occasion. The bones are afterwards disinterred, and carried to a considerable distance. For other particulars concerning them, see Abipons.

Cale, a port-town of the county of Kilkeney, province of Leinster, in Ireland. It was a borough before the union, and was often distinguished for the violence of the contests, having been of the kind called potwalloping, in which every housekeeper has a right to vote. It is of great antiquity, having been made a borough by William, earl Marshall, a descendant of Strongbow, in 1217, but it does not appear to have ever been a town of much importance. The present number of houses is 582, of which 46 only pay the window tax; the population is about 3,500, which is a considerable increase since 1713. It has no manufacture, except a distillery, and some lace made there, yet it has fine streams of water, and is in the neighbourhood of a bog, which supplies abundance of fuel. There are seven fairs, some of which are remarkable for the sale of horses, and others of turkeys, which are brought up here to be sent to Bridol. The liberties of the town include 3,060 acres of rich ground, with a lime-rock bottom, of which 1,400 acres only are productive. The crops of wheat grown here are very fine. A common of 1,000 acres formerly belonged to the town's people, which has been reduced by encroachments to about half the number, and the enclosure of the reef on a similar plan would be of great use. Indeed a resident and improving landlord might render this town very flourishing. Though the adjoining country is fertile and populous, the whole district of Callia, with five adjoining parishes, are united under one rector, who resides near Callia, the old church of which is in good preservation. These five parishes contain 41 Protestant families, most of which live in the town. There are the ruins of an abbey, and three castles, with some vestiges of walls, which are said to have been destroyed by Cromwell. There is also a moat, the perpendicular height of which is 40 feet, and the flat summit 138 feet by 72. A curious charter given to this town by William earl Marshall, may be seen in Coke's history of Ireland; the privileges conferred by which, though limited to be of all kinds which it became burghers to possess, and the grantor to follow, were left to the town, now enjoyed by the merchant subject of the United Kingdoms. Some other particulars might be collected from Tighe's Account of Killkenny, and the old histories, if it were necessary. Callia is on the road from Dublin to Cork, being 65½ Irish miles, S. W. from the capital. N. lat. 52° 32'. W. long. 7° 34'.

Callia, the name of a river in the county of Armagh, in Ireland, near which the city of Armagh is situated, and which flows through a remarkably fertile country. It joins the Blackwater near Moy.

Callenberg, a town of Germany, in the circle of Upper Saxony, and lordship of Schonburg; 4 miles N. E. of Zweickau. Also, a chain of mountains of Germany, commencing about 5 miles from Vienna, and traversing the duchy of Sturia.

Callender, in Geography, a town of Scotland, in the county of Perth, seated on the river Teith; 11 miles N. W. of Stirling, and 50 W. S. W. of Perth.

Callender, in Manufacturers. See Caileander.

Callie, in Ancient Geography, a town of Spain, in Bética, and in the jurisdiction of Aligis, according to Pliny.

Callée, in Geography, a town of Britain, in the country of the Atticati, placed, in Antonine's Itinerary, in his seventh route from Regnum to Londinium, between Venta Belgarum and Pontibis, 22 miles from the former, and at the same distance from the latter. Dr. Stukley places it at Farnham; and Mr. Horsey at Silehefer.

Calle, a town of Peloponnesus, in Arcadia. Paufanias.

Callagh-Crum, in Geography, a rock near Bin-nychead, in the county of Mayo, in Ireland. N. lat. 54° 21'. W. long. 6° 37'.

Callian, a town of France, in the department of the Var; 10 miles N. E. of Draguignan.

Callian, or Callian, a river of Hindooostan, the mouth of which is on the side of the found, formed by Bombay, Sallfort, and the neighbouring shores of the continent, opposite to the fort of Tannah. The ruins of Callian, noticed by Feryer, are probably those of the Calliana of the Periplus. Mar. Eryth.

Callianee, a town of Hindooostan, in the country of Dowlatabad. It is large and populous, confiding of one long street filled with shops; the houses are constructed of tile-wood, and covered with thatch; 65 miles W. of Beder, and 85 E. of Viapour. N. lat. 17° 45'. E. long. 76° 54'.

Calliaqua, a town and harbour at the S. W. end of the island of St. Vincent, in the West Indies. The harbour is the chief in the island, and draws thither most of the inhabitants and the greater part of the trade.

Calliber, or Caliper. See Caliber.
CALLIBLEPHARA, from καλός, beautiful, and βλεφαρίς, eye-lid, in the Medicinal Writings of the Ancients; a name given to certain compositions intended to make the eye-lids beautiful; and as the eye-lids are subject to be deformed in several ways, there were several different sorts of these medicines.

CALLIBOLIGE Sound, in Geography, lies to the N.E. from the nearest entrance into Savannah river, in the state of Georgia, in North America, behind Hilton-head island. The latitude there is 32° 4' N. W. long. 81° 12'.

CALLICA, in Ancient Geography, a town of Asia, in Bithynia, placed by Ptolemy at some distance from the Euxine Sea. CALLICARIA, a promontory of India, on this side of the Ganges, according to Ptolemy.

CALLICARIS, a town of India on this side of the Ganges. Ptolemy.

Sp. 1. C. americana, Linn. Sp. Gart. Tab. 94. fig. 5. La Marec Ill. Pl. 69. f. 1. (Johnfonia, Miller; fipho; locoboece, Mitch. eph. nat. cur. S. 809. Durbardia, Dumb. arb. 1. 111. Tab. 44. Pluk. aln. Tab. 136. fig. 3. Catecb. Car. 2. Tab. 4. Gron. v. 136.) "Leaves egg- shaped, acute, serrated, rather downy beneath; berries glo- merated." Lam. A shrub from three to six feet high. Branches round, or a little compressed, pubescent, and somewhat corymb near the summit. Leaves opposite, petiolate, green above, but downy on the nerves, and entirely covered with a short, whitish down beneath, from four to five inches long, and two inches broad. Flowers small, reddish, or purple, in small, axillary, branched, opposite corymbs scarcely longer than the petals, with downy peduncles. Berry superior, the size of a small pea, globular, purplish; at first red, afterwards deep purple; one-celled. Lam. and Gart. A native of Carolina, and professor Martyn says, also of Cochinchina, but quotes no authority. The seeds were sent to Miller by Cateby, in 1724; and the plants raised from them flourished in the open air till the severe frost of 1746, when most of them perished. They are caussily raised from seeds on a moderate hot-bed; but as the young plants are tender, they should be placed under a frame before the first autumnal frosts, and should be kept sheltered during the winter, having fresh air whenever the weather is mild. The following spring they should be transplanted into fresh pots or into the nursery bed in a warm situation; in three or four years they will have acquired strength enough to live in the open air through the winter; but in severe frosts the surface of the ground about their roots should be covered with old tan, and their tops protected by straw or fern. Miller. 2. C. cana, Wild. (C. tomentos, La Marec, Encyc. i. 56.) "Leaves ovate-lanceolate, serrated, very white, with down underneath; berries small, distinct." A shrub very distinct from the preceding, but so much resembling it, that La Marec found it difficult to form a satisfac- tory specific character. Flowers smaller, but more numerous, and in looser corymbs. Stamens twice as long as the corolla. A native of the East Indies, communicated to La Marec by Sonnerat. 3. C. latifolia, Wild. La Marec, Huf£ (C. tomentos, Murray. Syll. Veget. p. 135. Gumel. p. 240. Gart. Tab. 94. f. 5. C. folis integerrimis latifoliae. Mart. 331. Tab. tomentos, Linn. Sp. Pl. p. 172. Arbor malabarica, Ilia dietia. Burm. Zey. 26. ind. 36. Cornutia corymbosa, La Marec, Encyc. vol. i. p. 54.) "Leaves egg-shaped, entire, downy, underneath; smaller branches, pedicels and peduncles woody." Lam. Branches obtusely four-angled. Leaves opposite, large, petiolate, acuminate, green, and a little wrinkled above, resembling those of viburnum lantana, but more pointed. Flowers small, white, with a tinge of red, in short axillary and terminating cor- ymbs. Corolla scarcely a line long; calyx very woody; obscurely four-toothed, spreading. Berries small, blackish, half bedded in the permanent calyx. A native of the East Indies, communicated to La Marec by Sonnerat. 4. C. macrophylla, Wild. Vahl. Symb. 3. p. 15. Tab. 173. "Leaves lanceolate-elliptical, scolloped, attenuated, wrinkled above, white, with down underneath; branches downy." Perennial. A native of the East Indies. 5. C. frigida, Willd. Martyn. Swartz, prod. 31. "Leaves broad-lanceolate, serrated, rather rugged underneath; cymes terminating, and axillary." Perennial. A native of Java. 6. C. ribo- culata, Willd. Martyn. Swartz, 31. "Leaves elliptic-lan- cecolate, a little serrated, wrinkled, white, with down underneath." Perennial. A native of Jamaica. 7. C. longifolia, Willd. La Marec, Pl. 69. fig. 2. "Leaves long, lanceolate, a little toothed, green on both sides; corymb, or rather panicles, small, axillary." Perennial. Leaves seven or eight inches long, an inch and a half broad, opposite, petiolate, acuminate, thin, nearly smooth, except when young. Calyx short, but slightly four-toothed; filaments twice the length of the corolla. Style as long as the stamens; stigma truncate. A native of Malacca, communicated by Sonnerat. 8. C. integrifolia, Willd. Jacq. am. 15. Tab. 173. fig. 7. "Leaves egg-shaped, acute, very entire, a little downy underneath; racemes dense, axillary and terminating; tube of the corolla four times longer than the calyx." Perennial. A native of woods about Carthagena, in South America. 9. C. villosa, Willd. Vahl. Symb. 3. p. 14. "Leaves oblong-egg-shaped, very entire, reticulated beneath with downy veins; racemes axillary; pedicels many-flowered." Perennial. It differs from all the other species in its long peduncles, not detautomously branched. 10. C. japonica, Willd. Thumb. jep. 60. "Leaves oblong, acuminate, serrated in the middle, smooth." Stem thorny, erect, smooth; branches opposite, round, smooth, purple, disarticulated. Leaves opposite, on short pedicels, green above, pale underneath, armed, two inches long. Flower white, axillary, panedile, very small, panicle trichotomous, supra-decandrous, somewhat faltigate; bracteae linear; pedicels half an inch long, with very short pedicels; filaments inserted into the germ, very short; anthers oblong; germ superior; style axil-flanged, shorter than the corolla; stigma simple, acute. A native of Japan. 11. C. umbellata, Martyn's Miller, Loud. Cochinich. 70. "Leaves between top and egg-shaped, smooth, alternate; umbels sessile." A middle sized tree with ascending branches. Leaves quite entire, reflexed at the edge. Flowers small, in few-flowered umbels, axillary at the end of the branches. Calyx bluntly four-angled; corolla bell-shaped, with a short tube; filaments and stigma sessile. Berry fleshy, roundish, small. A native of Cochinichia in woods. 12. C. tris- thalia, Martyn's Miller, Lour. Cochinich. 70. "Stem climbing; leaves three-lobed; pedicels dichotomous." A long branching thorny, climbing by leafy tendrils. Leaves serrated, smooth, on long pedicels. Flowers axillary, pale. Berry 5 H 2 round.
CALLICORUM, in Ancient Geography, a rise of Asia Minor; placed by M. D’Anville in the eastern part of Bithynia, with a northern course into the Euxine Sea, to the call of Hercules, among the Canoceans.

Gen. Ch. Col. Involute of one or more leaves, including numerous fleshy flowers on a chiefly receptacle; penanth five-toothed, superior. Cor. monopetalous; tube cylindrical, swelling upwards; border five parted, spreading. Stam. filaments five or four, capillary; anthers oblong, erect. Ptl. germ inferior; style capillary, bilab.; stigma obtuse. Peric. Berry angular or wrinkled, one- or two-valved. Seeds two, flat on one side, convex on the other, angular.

pennatular; sometimes, but rarely, slightly oblique; from two to four inches long, or more; slender upwards, the thickness and form of the stem; two or three lines thick below, irregularly bent, brown without; divided into numerous prominent, unequal, somewhat wrinkled rings; of an acrid, bitter taste, but scarcely any smell; when dry the bark is thick, hard, brittle, brown without, white within, of a gummy, resinous nature, including a small, woody, white, nearly insipid, mucilaginous fibre, from which it is easily separated into numerous rings, which are smooth at their edges. Stem somewhat flabellately procumbent, then erect, sometimes excising at the base, round, about the thickness of a common quill; smooth and without leaves below, brown, and knotty with the scars of fallen leaves, the internodes upwards gradually decurrent in length; near the top pubescent, green, leafy; for a year or two simple; then throwing out a few leaflets, rather crooked, knotty runners, taking root irregularly at the knots, and producing one or two new stems about half a foot from each other. Leaves: from four to eight near the summit of the stem, opposite, spreading, three or four inches long, one or two broad, perfectly entire; deep green above and be sprinkled with roughish points, smooth, or rarely be be with a few scattered hairs; underneath pale green, and somewhat pubescent; with a rather elevated rib, and alternate, nearly parallel, lateral veins curved at the end; petioles short, channelled, a little hairy. Stipules two, extraflabellate, pressed close to the stem, deeply cut into awl-shaped divisions, slightly adhering to the petioles, about equal to them in length, and with them flaying the stem, thrivelling. Flowers aggregate in a solitary head, peduncled, terminal, and a little drooping; peduncle round, pubescent, about half an inch long; florets fissional, from fifteen to twenty-four, scattered by changeable leaflets or bracts; bracts the length of the involucrum and florets, pubescent, very entire, fissional, green, varying in form, sometimes longish-egg-shaped, sometimes rather obtusely lanceolate, and sometimes, but rarely, in size and figure resembling the leaflets of the involucrum. Involucrus: four-leaved; leaflets a little heart-shaped, acute, entire, almost fissional, slightly waved, hairy; the two outer ones largest, and all a little longer than the florets. Calyx, perianth, superior, permanent, membranous, white, very short, with five blunt teeth. Corolla monopetalous; tube cylindrical, long, a little swelling upwards, woolly about the throat; border shorter than the tube; with five egg-shaped, acute, recurved segments. Stigmas, filaments five, capillary, short, inserted on the upper part of the tube; authors oblong, linear, crept, projecting beyond the top of the tube. Petals, germ egg-shaped, not angular; yle thread-shaped, the length of the tube, round at the base with a short, nectariferous rim; stigmas two, oblong, rather thick, blunt, the length of the anthers. Pericarp, berry one-seeded, with two seeds, roundish, neither furrowed nor angular, crowned with the calyx, purplish red, soft, and finally becoming wrinkled and black. Those which fall before they are ripe, when they grow dry, have a little furrow on each side, occasioned by the separation of the leaflets, as they lie with their flat sides towards each other. Seeds two, elliptical, smooth, a little twisted; flat on one side, with a longitudinal, somewhat elevated line running down the middle; convex on the other, with a furrow near the apex. A native of moist woods in Pernambuco, and other provinces of Brazil, flowering from November to March, and ripening its berries in May. Described by Felix Avellar Brotero, professor of botany at Coimbra, with the assistance of observations made in Brazil on living plants, by Bernard Cohn, a resident medical botanist. It is called ipecacuanha by the natives in some parts of Brazil; pox do matto by those of the southern provinces; and cipo by others, which is the name often given it by the Portuguese settlers.

Though the root of this plant has been known in Europe about 150 years, and has been in general use as a valuable medicine nearly as long; and though figures of it were early published by Pio and Margarave, modern botanists have known little of its botanical characters, and were long unable to determine the genus to which it ought to be referred. Linnaeus, in a paper published in the third volume of "Amoenitates Academicae," gave it as a trivial name to a species of Euphorbia, a native of Virginia and Carolina, the root of which is there used as an emetic; but this was soon discovered not to be the real ipecacuanha. In his second Mantissa, he gave the same trivial name to a species of Viola, a native of Brazil, the root of which he supposed to be the white ipecacuanha of the shops. Descendes, in a paper published in the "Bulletins des Sciences par la Societe Philomathique," and published in particular in the "Nouveau Dictionaire d'Histoire Naturelle," says, there are three species of Viola which produce the white ipecacuanha: the caulicolaria of the species Plantarum, a native of Guiana and the Antilles; the ipecacuanha of the Mantissa, and the paraphora of the Supplementum Plantarum, both natives of Brazil. The roots of these, and especially the last, are sometimes mingled in commerce with the true or brown ipecacuanha; but they are a fraudulent adulteration, and do not possess its active properties. They may be distinguished by their colour; but most certainly by the size of the woody part, which in these is always considerably thicker than the bark, whereas, in the true ipecacuanha, it is much less; and, as described by Brotero, is only a fibre (filum). The roots of some species of Afelepsias, Cynanchum, Dorletinia, and Ruellia, have likewise received the name of ipecacuanha, on account of their pellifying some of the same qualities; but in this there is no deception, as they have been honestly called false or furious ipecacuanhas.

Some time before the year 1781, Mutis, then travelling in South America, sent to the younger Linnaeus a description formed from a specimen in full flower, which the governor of the province of Girong had received from Canaverale on the river Magdalena, and which an empire of the country, to whom it was shown by Mutis, positively assured to be the genuine ipecacuanha, having frequently gathered it in the neighbourhood of Simites, where it grows wild in great abundance, and whence it is regularly shipped to Mompoxia, as an article of commerce for Europe. From this description, Linnaeus judged it to be a species of Pilocytaria, a genus formed by his father for two or three plants that are natives of the East and West Indies, and published it as such in the "Supplementum Plantarum;" at the same time expressing a doubt whether it were really the ipecacuanha of Pio and Margarave; but also adding, that, from its resemblance to their figures, he was rather inclined to believe it the same.

In the year 1799, Dr. Woodville was favoured by Sir Joseph Banks with a specimen preferred in spirits, which had been sent from Brazil. A drawing taken from it was engraved and published in his Medical Botany. It was without a flower, but as its root was entire, there was no doubt of its being the real plant. Its genus, however, still remained in a state of uncertainty; for Dr. Woodville was of opinion that he could not "implyly follow the authority on which Mutis received the information." The lovers of natural history are, therefore, highly obliged to Professor Brotero for his satisfactory monograph on the subject, read at a meeting.
meeting of the Linnean Society in February 1804; and which, as no description of the plant has hitherto appeared in English, we have translated with little abridgment from the original Latin. Mr. Brotero does not seem to have been acquainted with the communication of Mutis to the younger Linnaeus; or, if we suppose that he must have formerly seen it in the Supplementum Plantarum, a work in the hands of every botanist, he had certainly forgotten it when he composed his dissertation. On comparing the two descriptions, there appear one or two important, and a few lighter differences; but there is to great a general resemblance, as to make it evident that they are very nearly allied to each other, and to render it probable that they belong to the same natural genus, and possess the same qualities in perhaps an equal degree.

In the description given by Mutis, there is no mention of an involucrum and the bracts which separate the florets are said to be so small as to be scarcely discernible. The first affects the genus as it has hitherto been characterized by all authors; and, as we, in conformity with them, have given it above. The other is only a specific difference; but we suppose it will be acknowledged to be a strongly marked one. The involucrum in Mutis's plant is awl-shaped and horizontal; in that of Brotero, they are deeply laciniated, and pressed close to the stem. In the former, the flowers are placed to axillary, and to have only from two to five flowers, which are not described as forming a head; but a simple inspection of Brotero's figure will make it manifest that they may be called either terminal or axillary with nearly equal propriety; also, their number may be a variable circumstance depending on soil and situation; or, if constant, may be introduced with advantage into the specific character. In all other respects, they are so much alike that the description of one will serve for the other. The credit of the Brazilian emprise, which seems to have suffered in the estimation of a regular European physician, by that degrading appellation, is therefore effaced. The blossoms of Sir Jof. Banks's plant, as figured by Dr. Woodville, agree in shape with those described by Mutis, and are strikingly different from those figured by Brotero; the root also of the former is more knotted and irregular in its surface. It may then, we apprehend, be fairly concluded, that there are at least two distinct species; and nothing forbids their being placed under the same genus, as nature certainly dictates, but the want of an involucrum in that described by Mutis. The presence or absence of an involucrum is, however, a circumstance which ought not to enter into the essential part of a generic character. The genus Corus might be cited as a familiar case in point; but calliocca itself, as it actually now stands in authors, is a sufficient instance. For if, in spite of Schreber, the Maccaroni, and Willdenow, all agree in referring to it an involucrum, as an essential character, Schreber inconsistently adds, in a note, that it is in some cafes without one, and of Willdenow's 12 species, four are expressly said, to have naked heads, or to be ditillate of an involucrum. Whether the plant which the latter author mentions as having an involucrum of any species of a similar description we cannot determine, as the alphabetical part of the Encyclopædia is not so far advanced; and though he has figured it in his Illustrations, and given what he thought its essential character in the sympotic table, at the head of the clafs, the enumeration of the species remains unpublished. The three species figured by him have a very conspicuous involucrum. Two of them we have not ventured to quote; of the carpinchen, Willdenow's involucrata, there can be no doubt. Upon the whole, it seems to be evident, that the involucrum ought to be excluded from the generic character. The essential difference between it and morinda will then entirely rest on its flat, chaffy, or, as it might perhaps better be called, bracted receptacle; which, at least as far as precedent goes, will be deemed a sufficient distinction. Psychotria differs from both in not having the flowers in heads on a common receptacle. Mutis in his description of his psychotria emetica does not mention a common chaffy receptacle; but the sessile flowers on a common peduncle, with a bract to each flower, clearly imply it, and knew that the species is properly a calliocca. We shall therefore add, 14. C. mutisii, (psychotria emetica, Linn. jun. Sup. Pl. p. 144.) variable, susceptible, pubescent, pedunculate, smooth; fructes entire, awl-shaped; corolla five-parted, chaffy bracteae very small." A native of Brazil. All the known species are perennial.

We have followed Schreber and Willdenow with little hesitation in uniting the tapogeone, pataeae, and even of Anble, though the Maccaroni has kept them separate. A difference merely in number cannot warrant the construction of a new genus. Of the carpinchæ we have much doubt, on account of the important difference in the fruit. The plant made it a distinct genus in the alphabetical part of the Encyclopædia, but has figured it as a species of his tapogeonæ in the Illustrations, which must be considered as his latest decision on the subject. Nor can the genus of tapogeae and even be absolutely fixed, till we become acquainted with their fruit.

Calliocoæ, in Manufactures, a species of cotton cloth, originally imported from the East Indies, from the kingdom of Calicut, on the coast of Malabar, whence the name Calicoæ is derived.

The term is now generally applied to cotton cloths of English manufacture, and comprehends many varieties of fineness and texture. English calliocoæ were first manufactured at Blackburn in Lancashire, about 30 years ago, and have since become one of the leading articles of national industry, affording employment in the various details of spinning, weaving, bleaching, dying, &c. to a considerable portion of the population of that county. See Cotton Manufactures.

Calliocoæ-Printing. See Printing.

Calliocolonæ, in Ancient Geography, a hill of Asia Minor, in the Troade, and in the vicinity of Simois, accorded to Homer. It is mentioned by Strabo.

Calliocrates of Tyre, in Biography, an historian who flourished under Archelaus, and wrote his life; but he is said to have dwelt too much in trifling incidents. Vespasian lauded him the most learned of all the Greek historians of his time.

Calliocrates, an Athenian architect and sculptor, who lived about 472 years before Christ. He is said to have engraved some of Homer's verses on a grain of millet, and to have made an ivory chariot which might be concealed under the wing of a fly, and an ant of ivory in which all the members were distinct. Alcan, however, justly ceases him for employing his talents in performances so trivial and useless, and yet so difficult.

Calliocrates, a Lacedemonian general, who succeeded Lyæander in the command of the Athenian fleet. He was eminently distinguished not only for his valour and military skill, but for his simplicity, integrity, and magnanimity. When he arrived at Ephesus to take the command, Lyæander adopted every base and treacherous method in his power to embarrass him; and with this view sent back to Cyrus, the ally of Sparta, the money which he had given to him for the naval service, and, at parting, he said to his successor with a sneer: "Let us now see, Calliocrates, how you
you can defray the charges of your army." This hostile measure involved him in difficulties, more especiably as he could not recur to those means of relief which Lydander did not scruple to adopt. At length, when all his resources were exhausted, he repaired to the court of Cyrus in order to solicit pecuniary assistance. But, treated with neglect, and disappointed in his expectations, he returned to Ephesus; determining, however, not to procure relief, urgent as his necessities were, by doing any thing that would entail disgrace on his country or on himself. Cyrus, on subsequent deliberation, sent after him a supply of money for the payment of his troops, together with presents for himself.

The former he retained, but returned the latter with this memorable message: "That there needed no private friendship between Cyrus and him, because as long as the king observed the conditions of his treaty with the Lacedaemonians, he should think himself bound by it." He then attacked and defeated Conon the Athenian general, and besieged him in Mytilene. Hearing afterwards that the enemy's grand fleet was at Arginthis, opposite to Lebros, where he was stationary, he resolved to engage it.Whilst he was sacrificing in the morning, the foot-halter informed him, that, if he fought, the fight would in the issue be prosperous, but that the admiral would lose his life; to this declaration he replied, without any apparent concern; "Let us fight then; Sparta will not lose much in losing me; but he would forfeit his honour, if I retired in the flight of the enemy." An obstinate engagement ensued, in which Callirhides was sunk with his ship; B. C. 425; and, notwithstanding the foot-halter's prediction, the Lacedaemonians were defeated with great loss. Anc. Un. Hist. vol. v. p. 453.

CALICULAR MONS, in Ancient Geography, a mountain of Italy in Campania.

CALIDROMUS, a mountain in the Locride at the foot of which was the passagio of Taphrysia.

CALIDRYS. See Calidris.

CALIDRYS, in Ornithology, a name given by Belonius and some other authors, to our common red-throated; Scolopax calidris.

CALIDRYS, of Belonius, supposed by some to be the same bird as Tringa communis of modern ornithologists, or what we call the knot, but this is doubtful.

CALLIFÉ, in Ancient Geography, a town of Italy in Samnium, in the country of the Hirpini. Livy.

CALLIGA, a town of India, on this side of the Ganges. Ptolemy.

CALLIGICUM, a promontory of India, in the peninsula on this side of the Ganges, which terminated the Argaic gulf to the north-west.

Gen. Ch. Cal. Cal. perianth one-leaved, top-shaped at the base, with a five-parted border; segments nearly equal, roundish, spreading, finally a little reflexed, permanent; the two outer ones a little smaller than the others. Coroll. none, unless the calyx be considered as such. Stam. filaments about sixteen, diverging, capillary; pubescent, and a little thickened near the base; slightly united at the base in the form of a neck; anthers roundish, two-celled, peltate. Pet. germ superior, egg-shaped, four-fidged, acuminate; styles four, sometimes only three, thread-shaped, spreading, a little united at the base, scarcely longer than the filaments; stigma capitate. Peric. none, except the calyx. Seed, with a juicy, incompressible, naked or semi-naked, oblong, four-fidged, four-winged, one-celled, without valves; wings either membranaceous, longitudinally two-parted, toothed, and curled; or rough with branched bristles, kernel of the same form.

Eff. Ch. Calyx five-parted, corolla none, filaments about sixteen, a little united at the base, germ superior, four-fidged, stylar, three or four, nut four-winged, one-celled. P. L'Heritier.

Sp. t. C. polygonoides, Linn. Sp. Pl. (polygonoides, Tourn. Corol. 47. Tab. 478. Istn. Orient. vol. ii. p. 536.) with a figure." "Fruit latticed; bristles branched, rigid." P. L'Heritier. A shrub three or four feet high. Stem as thick as the human arm, zigzag, hard, brittle, covered with a reddish bark, divided and subdivided into many similar branches, which at length put out numerous jointed twigs of a green-moss colour, an inch or fifteen lines long, and half a line thick, which Tournefort calls leaves, and says are so like those of Ephedra, that it is not possible to distinguish them without seeing the flowers. Flowers at the joints of the upper ramifications, on slender, short peduncles, pale green in the middle, white at the edges, permanent; filaments white; anthers purple. Fruit half an inch long, four lines thick, conical, deeply furrowed longitudinally; angles terminated by wings cut into fine fringes. La Marck calls it a capsule. Found by Tournefort near the river Araxes in Armenia. 2. C. comosum, Willd. P. L'Heritier. Linn. Trans. vol. i. and Strup. vol. ii. p. 57. La Marck Illust. Pl. 410. (Pterococcus apellalbus. Pallas, Voyag. ii. p. 758. Tab. 8. French Translation, p. 473, and 547. Pl. xvi. Pallasia caprica, Linn. Supp. 252. Saviugy in Encyc. Pallasia Pteroccus. Pallas Pl. Ross. ii. p. 70. Tab. 77, 78.) "Wings membranaceous, curled, toothed," P. L'Heritier. A shrub three or four feet high. Root thick, woody, an inch and half in diameter, differing deep into the land, with a tuberous head. Stems numerous, about the thickness of a finger, erect, branched, spreading, thick-stemmed, brittle, with a grey, fluted bark. Branches, alternate, round, zigzag, jointed, a little knotty, without leaves; putting out every spring, at each joint, from six to ten clove feet, herbaceous, rough like shoots, sometimes simple, sometimes branched, of a fine green and nearly glaucous colour, a few of which surive the winter, and are hardened into branches; the rest perish, and leave a knotty bear. Stipulae membranaceous, obscurely trifid, thrifling, surrounding the joint as in the polygonums. Leaves alternate, sessile, solitary, at each joint of the herbaceous shoots; round, awl-shaped, semi-fleshy, resembling the shoots, half an inch long. Pallas says there are no leaves, but P. L'Heritier affirms that they were actually present in plants cultivated by himself, which flowered and ripened their fruit. Flowers numerous in clusters, from three to five together; lateral or axillary within the flowers, on the young or woody branches, as well as on the herbaceous shoots; white, with a greenish tinge in the middle. Stamens ten, the length of the calyx, and withering with it as the fruit increases, without falling off; filaments bristle-shaped, thick in the base, downy; anthers nearly globular, two-celled. Germ conical, four-fidged, rarely three-fidged, the bivalve angles prolonged so as to form the wings of the fruit. Wings somewhat oval, of a crimson colour, fringed, and split near the edges, spreading.

and Vallas, were a called good hand, who

read the god of the Crete. Vallas said of the Greeks. Vallas, in the prefale to her edition of his poems, says, that, among the writings of ancient Greece, there is nothing more elegant and polite than these compositions of our author. To the fame purpoe her father, Tanaquil Faber, in his "Abregé des Vies des Poetes Greeks," declares, that Callimachus's manner of writing is neat and strong; and that Catullus and Propertius frequently imitate him, and sometimes translate him. Accordingly the "Coma Berenices" of the former is a translation from Callimachus. Of the various editions of this writer we may mention Mad. Dacier's, 4To. Paris, 1674; Bentley's, 8vo. London, 1741; Grauvius's, 8vo. Utrecht, 1697; Erne- neth's, 8vo. L. Bat. 1761; Loefner's, 8vo. Lipf. 1774. We have a tranlation of the works of Callimachus into English verfe, with notes, &c. by Dr. Tytler, 4To. Lond. 1792. Gen. Diet.

Callimachus, in Geography, a promontory of Africa, in Marmarica; and also a village situate towards the north-eall of this promontory. Polemy.

Callimachus, in Biography, a celebrated architect, painter, and sculptor of Corinth, flourished about the year B.C. 540. To him is ascribed the invention of the Corinthian order. See Abacus. He also made a golden lamp for the temple of Minerva at Athens, which he furnished with a wick of allotio, that it might burn without wasting. Callimachus acquired the name of k\textsubscript{a}k\textsubscript{a}k\textsubscript{a}k\textsubscript{a}-t\textsubscript{e}p\textsubscript{e}p\textsubscript{e}, from being unable to please himself by his works.

Callimachus, a celebrated poet, grammarian, and critic, was a native of Cyrene in Libya, flourished in the reigns of Ptolemy Philadelphus and Ptolemy Euergetes, being one of the keepers of the Alexandrian library, and died about the year 244 B. C. He was the son of Battus and MFatome, whence Ovid denominates him "Battidae." Strabo (ib. xvii.) informs us, that he claimed descent from king Battus, who was the founder of Cyrene. He was a disciple of Hermocrates the grammarian, and excelled no less as a critic than a poet. Before he was recommended to the favour of Ptolemy Philadelphus, he taught school at Alexandria, and had the honour of educating Apollonius, the author of the Aragonauts. His poetical compositions were chiefly short pieces, as hymns, elegies, and epigrams; and when it was objected to him by his enemies that his Muse could not undertake any considerable work, he made use in reply of the saying which has become proverbial "A great book is a great evil." His powers, however, were manifested by two works of greater extent, entitled "Hecate," and "Aitia." The characteristics of these poems of Callimachus, which have reached our times, are elegance and polish, and choice of expressions; and these correspond to the character given of him as a poet by Ovid (Amor. eleg. 15. lib. 1):

"Battidae toto fempert cantabatur orbis; Quamvis ingeniis non valet, arte valet."

"The strains of Battus' son shall never depart;" If not in genius, he excels in art."

Quintilian, in his "Institutiones Oratoriae" (l. x. c. i.), applauds Callimachus as the prince of elegiac poets, among the Greeks. Mad. Dacier, in the preface to her edition of his poems, says, that, among the writings of ancient Greece, there is nothing more elegant and polite than these compositions of our author. To the same purpoe her father, Tanaquil Faber, in his "Abregé des Vies des Poetes Greeks," declares, that Callimachus's manner of writing is neat and strong; and that Catullus and Propertius frequently imitate him, and sometimes translate him. Accordingly the "Coma Berenices" of the former is a translation from Callimachus. Of the various editions of this writer we may mention Mad. Dacier's, 4To. Paris, 1674; Bentley's, 8vo. London, 1741; Grauvius's, 8vo. Utrecht, 1697; Erne- neth's, 8vo. L. Bat. 1761; Loefner's, 8vo. Lipf. 1774. We have a tranlation of the works of Callimachus into English verfe, with notes, &c. by Dr. Tytler, 4To. Lond. 1792. Gen. Diet.

Callimachus, in Physiology, a fially substance found in the cavity of the utters, or cagle stone. The word is also written callimus, and in some copies of Pliny calicus; which latter reading Salmasius receives. The callimus fills the hollow of the utters, much as the yolk does the white of an egg.
The goodes, instead of a callimus, or solid stone, have a loce, faney, chalky, or earthy substance, and the enyhdris a liquid substanice.

Callenger, in Geography, a town of Hindoostan, in the SSH of Bundelcund; 2 miles W. S. W. of Allahabad.

Callington, is an ancient small borough town of Cornwall, England. Its situation is low, the surrounding country bleak and barren, and its houses are mostly small and different buildings.
buildings. Here is a cloth manufactory, which furnishes employment to some of the poor inhabitants. It has a weekly market on Wednesday, and two annual fairs. Callington being only a member of the parish of South-hill (where the church is situated) has a chapel of ease within the precincts of the town. The earliest mention of this place on record occurs in the time of Henry III. who in the 52d year of his reign granted the privilege of a market to Reginald de Ferrars, who was then lord of the manor. The town was constituted a borough in the 27th year of Elizabeth, when it obtained the privilege of sending two members to parliament, which right has continued to the present time. The borough is governed by a portreeve, but it does not possess any charter of incorporation. The elective franchises of the inhabitants are not clearly ascertained; but the present custom limits the right of election to the burgage-tenures paying rent and lot, and the number of voters is about fifty.

On the highest part of Hengeston-downs near Callington is St. Kit's-hill, which consists entirely of granite. Near the top, a thatch has been funk for digging tin, and it is found that the lode of ore is impregnated with wolfram united with quartz. Callington contains 145 houses, and 519 inhabitants. It is 216 miles W. from London.

CALLINICON, or CALLICINUM, in Ancient Geography, called also Leontopolis, a town of Asia, situated on the left of the Euphrates, near Niccephorium. Procopius informs us, that Cosroes, king of Persia, took and razed this place.

CALLICINUS, in Biography, a native of Heliopolis in Syria, who defected from the service of the caliph to that of the emperor, and who imparted the secret of compounding and directing the Greek fire, to which the deliverance of Constantineople in the two sieges, A. D. 716—718, has been ascribed. See Greek Fire.

CALLICINUS, surnamed Sutorius, was a native of Petra in Arabia; but spent the greatest part of his life at Athens. He wrote the history of Alexandria in ten books, quoted by Jerome, and published several other pieces on various subjects. He flourished in the reign of Antoninus. Suidas, vol. ii. p. 232.

CALLINUS of Ephesus, a very ancient Greek poet, said to be the inventor of elegiac verses; some specimens of which are to be found in the collection of Stobaeus. He flourished about 776 years B. C.

CALLINUSA, in Ancient Geography, a promontory of the isle of Cyprus, according to Ptolemy, marked on the chart of M. d'Anville on the northern coast towards the west. In some charts it is called "Cape Elieni," and in others "Alexandretta."

CALLIONYUS, in Ichthyology, a genus of fishes, in the order Piscis jugulare, the character of which is as follows: upper lip doubled, or folded in two parts; eyes approximate; branchiolegous, or gill membrane, with fix rays; aperture for breathing in the neck; gill covers shut up; body naked; ventral fin very remote.

The species of this genus are lyra, dracunculus, indicus, baikalenis, ochelatus, lagittia, and japonicus; which see respectively.

CALLIOPE, in Entomology, a South American species of Papilio, described by Linnaeus, and delineated in Clark's Icon. t. 41. and also by Seba and Cramer. The wings of this insect are yellow, with three streaks on the anterior pair, and three bands on the posterior ones of black.

CALLIOPE, in Ancient Geography, a town of Asia in Syria, which was one of the principal fortresses of the Parthians against the Medes, according to Pliny.

CALLIOPE, in the Pagan Mythology, the chief of the nine Muses, called by Horace Regina. The distinguishing office of this Muse was to record the worthy actions of the living; and accordingly she is represented with tablets in her left hand.

Such may be seen on the marble apotropaia of Homer, and upon the sarcophagi of the capital and of the Matterce palace, which represent the Muses. To Calliope, represented by some writers as the mother of the Corybantes and Syrens, but more commonly as the mother of Orpheus, is ascribed the invention of heroic poetry; and her name, according to Diodorus (Bib. Hist. I. iv. & viii.), was derived from her fine voice, ΑΤΙΟΝΙΟΝ. From this etymology it has been inferred that Calliope is the symbol of rhetoric and eloquence; but Ennius (II. A. v. i.) affirms that she was the emblem of heroic poetry, the most noble and most ancient species of poetry. As to her fine voice, she polished this talent in common with her other sisters. Upon the medals of the Pomponian family, she is designed by a head crowned with laurel, with a roll or volume from which strings are suspended, in the field of the medal.

CALLIPEDIA, the art of getting or breeding fine and beautiful children. The word is formed from καλλιπερα, fair, and κερατος, puer, either boy or girl. We find divers rules and practices relating to this art, in ancient and modern writers.

The Jews are said to have been so solicitous about the beauty of their children, that care was taken to have some very beautiful child (such as was Jochanan, the disciple of Judah, author of the Mishna) placed at the door of the public bath, that the women at going out, being struck with his appearance, and retaining the idea, might all have children as fine as he. The Chinese take great care of their breeding women, to prevent unclean objects of any kind from intruding their imagination; and musicians are employed at night to entertain them with agreeable songs and odes, setting forth the duties and comforts of a conjugal and domestic life, that the infant may receive before its birth good impressions, and come forth not only well-formed in body, but suitably dispossed in mind.

Callipedia, nevertheless, seems to have been first crested into a jilt art by Claude Quillet de Chillon, a French abbot, who, under the fictitious name of Calvifar Luetus, has published a fine Latin poem, in four books, under the title of Callipedia, esse de pulvis prolix bohanda ratione; wherein are contained all the precepts of the art. Paris, 1656, 8vo. & Lond. 1708, 8vo. It was translated into English verse by Mr. Rowe.

CALLIPHAES, in Mythology, one of the Ionides.

CALLIPAPA, in Ancient Geography, a fountain of Ephesus, so called by Piny, and denominated "Alita" by Pausanias.

CALLIPIDÆ, a people of Scythia near the Palus Mæotis. According to Herodotus they were a colony of Greeks, established in Scythia. Pomponius Mela alligns them the space that lay between the Axaces and the Issipan or Bogus.

CALLIPOLIS, denoting beautiful city, a name given to several towns, on account of the peculiar advantages of their situation or structure. Thus, Callipolis was the name of a city on the Chersonese of Thrace, near the Heleipont, and opposite to Lampfeaus. See CALLIPOLIS—Allo, a town in Sicily, on the eastern coast, north of Catana and of the river Aci—Allo, a town of Caria—Allo, a town of Magna Graecia, at the extremity of a peninsula in the country of the Salentins, in the gulf of Tarentum—Allo, a town of Poelponneus—Allo, a town of Greece in Attulia, separated from Naxopidea by a high mountain, called "Caraux."—Allo, a town of Asia, towards Galatia and Armenia. 51 —Allo,
—Also, a town of Spain, near the Mediterranean sea, between mount Sallus and Tarragona.

CALLIRHOE, is reckoned of sacred, beautiful, and cult., to Aphaea, a fountain of Greece at the gate of Calydon, in Corinth.—Also a fountain of Attica, called "Euniceiros," from its spring for channels.—Also, a lake of Achaia in Methone, near which was seated the city of Antioch—Also, a mineral fountain of Palestine, before the town of that name, and the fortress Machera, according to Pliny.—A city of Arabia, included in the territory of Moab, near the Alphabite lake, and famous for its warm baths. According to Jophus, Herod the Great, in his ill health, was conveyed hither. Ptolemy places it on the coast of Jordan and of the Dead Sea.

CALLIRHOE, in Entomology, a Fabrician species of Papilio, (Don, Canl.) peculiar to Achaia. The wings are entire, with the tip of the anterior pair, and six spots on the posterior side, black.

Gen. Col. perianth three-leafed: leaves linear-lanceolate, keeled, erect, permanent. Corol. petals three, lanceolate, acuminate, erect, spreading at the top, the length of the calyx. Stam. filaments three, capillary, longer than the corolla, dilated at the top into a roundish lamina: anthers double, globular, fixed to the inside of the lamina. Pylg. germ superior, oblong, compressed: style capillary, the length of the stamens: stigma three, spreading, pencilled. Peric. capsule, egg-shaped, compressed, acute, two-celled, two-valved: valves contrary. Seeds two, roundish. Nearly allied to commelina, and differing from it chiefly in the want of the three barren filaments, tipped with forked-flanged glands, called nectaries by Linneus.

"Flowers axillary, nearly sessile; stem smooth." Lam. Illust. Root annual. Stem herbaceous, tender, creeping from the joints, rather erect at top, a little branching at the base. Leaves alternate, egg-shaped, acuminate, somewhat heart-shaped at the base, thickened, thick-filied, growing near together as they approach the top of the stem. Flowers small, generally three together from each sheath of the upper leaves, tender, greenish. 2. C. umbellulata. Lam. Pl. 35. fig. 2. "Little umbels lateral and terminal; stem downy near the top; peduncles downy," Stem branched. Leaves egg-shaped, acuminate, petiolate; but those near the top of the stem sessile and lanceolate, thicken. Umbels simple, from two to five-flowered, but the flowers are occasionally single, flowers on rather long pedicels, densely. Description formed from La Maree's figure. Both the species are natives of South America and the West Indies. The first was introduced into England in 1776 by Dr. Tolerghil.

CALLISTA, in Botany, a genus formed by Lourieo for a parasitical plant which grows on the trunks of old trees, and which might have been referred to Ephedreum. He gives it the following character. Clas and order, gynan- dria monandria. Cal. none, but instead of it several ovate-lanceolate scales. Cor. petals five, spreading; three sese花 ovate-oblong: two opposite, unciliated, large, swelling at their base. Nectary tubular, within the petals and attached to their base, large, two-lipped: upper lip, oblong, fleshy, with two horns at its base; lower lip, entire, downy, funnel-shaped. Stamina one, attached to the upper extremity of the nectary; anther opculate, two-lobed. Pylg. germ inferior, twinned, thread-shaped, style and stigma none, unless we consider as such a furrow which passes from the stamen to the germ. Fruit generally abortive. Root a linear bulb. Stem thick, furrowed. Leaves alternate, lanceolate, entire, fritiated, thick, hard, sheathing. Flowers white, in long, lateral, drooping, simple racemes. Bosc. Nouv. Dict.

CALLISTHENES, in Ancient Geography, a name formerly given to an island of the Grecian Archipago, afterwards called Theria, and now Santorin, which lies...
the battle between Darius and Alexander. He composed
many other historical works, which are not now extant.
The most considerable was, a "History of Greece," com-
prehending 50 years from the peace of Antalcidas. He
also wrote a "History of the Trojan War." A "Periplus," 
"Pericles," "Macedonies," "Thracies," and "Metamor-
phoses," are also ascribed to a writer of his name. His
"Apolooptieas" are also mentioned; among which was a
faying formerly famous in the schools—"that human life is
governed by fortune, not by wisdom." Arrab., ab. supra.
Plutarch in Alex. spud oper. t. i. p. 635. &C. Quintus
Bilog.

CALLISTIA, Kalldiæ, in Antiquity, a Lacedaemonian
feast, wherein the women presented themselves in Juno's temple,
and the prize was assigned to the fairest.
The word is formed from 4|a|o|a|o|a|o|a, beauty, q. d. beauty's
rewards. The like contest of beauty was held at the festi-
fal of Ceres Eleusinæ, among the Partholanae, first set on
foot by Cyphbus, whose wife Herodice was honoured with
the first prize. Another obtained among the Eleians, where
the contest was among the men, the most beautiful of whom
was presented with a suit of armour, which he consecrated
to Minerva, to whose temple he walked in procession,
adorned with ribbons, and crowned with a myrtle garland,

CALLISTRATIA, in Antiquity Geography, a town of Asia
in Galatia, according to Ptolemy; but it rather belongs to
Paphlagonia. It was situated on the coast of the Euphrat
sea, S. E. of the promontory of Caramus, and S. of that of
Zephyrium.

CALLISTRATUS, in Biography, an Athenian orator
who flourished about the year B.C. 340. After having
acquired great reputation and authority in the government of
his country, he shared the fate of others of a similar de-
scription, and was banished. He is probably the same per-
son that is mentioned by Demophones (Orat. adv. Polycem.)
who was banished to Methone in Megapotamia, and whom
the Athenians had twice condemned to death. The succees
of his pleading in a public cause of importance, which
Demophones attended in his youth, and the glory acquired
by it, induced this young disciple of Plato to abandon the
studies of philosophy, and to devote himself entirely to that
of oratory. Callistratus is said to have manifested great ab-
horrence when, under a sentence of exile, some person ex-
pressed a wish, that the Athenians might soon be obliged to
release the exiles. Similar to this was the conduct of Ru-
tilius, who retorted against one who proposed to comfort
him by representing to him, that a war would soon break
out, which would occasion all the exiles to return; "What
have I done to thee, that thou shouldst wish me a return
worse than my banishment? I chuse rather that my coun-
try should blush at my banishment, than mourn at my return,"—Plut. in Demophoen. spud opera, t. i. p. 817. Se-
necia de Benef. i. vi. c. 57. Gen. Dict.

CALLISTUS, Johannes Andronicus, a learned
Greek philosopher, was a native of Thasus, and settled at
Conflantinople, where he was a professor of the Peripatet-
istic philosophy, and acquired a high reputation for learn-
ing. Upon the capture of this city in 1453, he fled with
many others into Italy, and fixing his first residence at Rome,
taught the Greek language and read lectures upon Aristotle's
philosophy. From hence, for want of due encouragement,
he removed to Florence, where he had a vall concourse of
disciples. After spending several years in Italy, he closed
his life in France. Callistus was one of those learned Greeks
to whom we are indebted for the introduction of learning
into the west. Some Greek MSS. bearing his name are
still extant; and particularly one in the royal library at
Paris, entitled, "A Medley upon the Miracles of Con-
flantinople." Some philofophical and moral pieces in MS.
are also ascribed to him. Log. Dict.

CALLITHRICHES, in Botany (from saba, and $t, fine
hair, but there does not appear any peculiar propriety in the
appellation). Linna. Sp. Pl. Chas. and order, monandria
jed. Vent.

Gen. Ch. Cal. none. Cal. petals two, incurved, acumi-
nate, channelled, ovate. Sem. filament one, long,
recurved: anther simple. Pet. germ roundish; styles two,
capillary, recurved; stigma acute. Peric. capil. roundish,
none; unless the proper tune of the seeds he so called. Seeds
four, naked, semi-elliptical, lenticularly composed, furnished
on the outer side with a broadish membranous margin,
disposed in a kind of compressed rows so as to appear in
pairs, of a pale blue colour. Gart. Dr. Smith.

four, composed, with a winged margin on one side.

Obf. The corolla of Lisanus and the English authors, is
considered by La Marec, Jussieu, &c. as a two-leaved
calyx.

c. 614. Lenticula, L. eff. Pruf. 140. tab. 38.) Water-flat-
wort, or flat-headed water-chickweed. Annual. Roots
fibrous, simple. Stems slender, branched, leafy, smooth;
floating by means of its thickest broad upper leaves, till the
perigeanation is accomplished; then each flower sinks, by
the elongation of the top of the stem, where new ones are
produced, and finally the whole herb subvides to the bottom,
takes root there, ripens, and sows its seeds. The young
plants soon rise to the surface, and appear to be nourished
from the water by simple slender roots from each joint of the
stem, which do not reach the ground till the plant subvides.
The earlier leaves are opposite, spinula-flapped, entire,
three-nerved; but those produced in autumn, after the herb
sinks, are linear, single-nerved, and cartilaginous, which occasioned
the distinction of this species into two. Flowers, axillary,
spatulate, sepalis, small, whiffih. Dr. Smith. If the chiefs
Polygamy were preferred, as established by Linnæus, this plant
would indisputably belong to it, some of its flowers being
hermaphrodite, others with only staminata, and others with
only pistils. Lisanus states the flowers of his autumnales
to be all hermaphrodite, but, according to Dr. Smith, the
plant does not flower in that state. Difficult seems to have
been the first that doubted whether there were more than
one species. See this edition of Ray's Synopses. Very
common in England, and the greater part of Europe, in
ditches and standing waters.

CAllithriches, in Zoology, the name under which the
green ape of the English writers (Simia saba of Schrèber
Saucuth) is described by Buffon.

CAllithrichum, in Botony. (J. Bauh. Morif. Ray.)
See Melissa pyrenaica.

CAllithrichus, in Zoology, synonymous with Call-
ithrix, a fort of monkey of a yellowish green colour,
with black flatish face, called by Pennant the green monkey.
This is the animal named Simia sabae by Schrèber. See
Simia Sabæa.

CAllithrix, in Zoology, Simia callithrix magnitudinis
magnorum cynomorphorum, Alpin. Aeg. See Simia
Silenus.
CALLIXENUS, in Botany. (La Mareck, Juff.) See Eucalptus.

CALLIXTUS, or CALLIXTUS I., pope, in Biography, succeeded Zephyrinus in the year 210. Some have said that he built a church to the memory of the Virgin Mary, which is now known by the name of Santa Maria in Trastevere, or St. Mary beyond the Tiber; but it is more certain that he enclosed a large piece of ground in the Appian way as a burying-place for the Christians. The story of his martyrdom, with its attendant circumstances of cruelty, is not very probable, as Alexander Severus was tolerant and favourable to the Christians. He died in 233. Bower's Hist. of the Popes, vol. i.

CALLIXTUS II., pope, was Guy of Burgundy, the son of William the Great, count of Burgundy, and nearly related to the emperor Henry. Before his election to the papacy he was ambassador to Vienne and on the death of Gelisius at Cluny, in 1119, he was unanimously chosen to succeed him by all the cardinals, except those who were of the emperor's party, who adhered to the anti-pope Maurice Brunus, or Gregory VIII. This was a happy choice both for the church and state. Soon after his election, Callixtus held a council at Rheims, in which the emperor, who refused to renounce the right of investiture, was solemnly excommunicated. From Rheims the pope repaired to Ghent in Normandy, in order, by means of an interview with Henry, king of England, to mediate a reconciliation between him and Louis king of France; but his conciliatory efforts were ineffectual.

From Normandy he passed over into Italy, and having obtained some forces from the Norman princes in Apulia, he besieged his rival Bordin, who had retired to Sutri, took him prisoner, and thus terminated the schism. Earnestly desirous of peace with the emperor, he went legates to Germany, and a peace was concluded at a general diet held at Worms, in 1122. The emperor was allowed the right of receiving an oath of allegiance from bishops and abbots elected, and of conferring on them the regalia, for which they were to do him homage; whilst he consented to surrender the ceremony of investiture, both to the ring and crozier, which was regarded as an emblem of the sovereignty of spiritual authority. The articles of agreement, settled by the pope and emperor, were approved by the general council held at Lateran in the following year, and remain still in force. After a pontificate of nearly six years, this pope died in 1124, and left a great character for moderation and liberality, and a just impression of the canons. Thirty-six letters of this pope are preserved; and other works in MS., on the miracles of saints, are attributed to him. Bower, vol. vi. Motheim, Ecc. Hist. vol. iii.

CALLIXTUS III., pope, was advanced to the pontifical chair in 1455, at the age of 76 years. His name was Alphonso Borgia; he was descended of an ancient family, and born at Nativa, in Spain. Before his election he was secretary to Alphonso king of Arragon, and employed in terminating the schism occasioned by the anti-pope Clement VIII.; and for this service he was preferred by pope Martin to the see of Valencia. Immediately after his elevation to the papacy, he exerted himself in restraining the progress of the Turks under sultan Mahomet II., who had taken Constantinople, and threatened all Christendom. For this purpose he fitted out a small fleet, which retook some of the islands of the Archipelago; and by means of a crusade, which he caused to be preached throughout Europe, he raised a considerable army, which was committed to the conduct of the famous Hunkiards. Notwithstanding a victory obtained at Belgrade in 1456, which obliged Mahomet to raise the siege of that city, and the remembrance of which the pope immortalized by ordering the festival of the "Transfiguration of Christ" to be religiously observed throughout all the western world, the Turkish army proceeded in its conquests. The pope's attention was soon occupied by other concerns. Having ambitious designs in favour of his nephew, whom he had created duke of Spoleto, he quarrelled with his former patron the king of Arragon, and refused to grant to his natural son Ferdinand the investiture of the kingdom of Naples. On the decease of Alphonso, he declared openly against Ferdinand, and would have kindled a civil war in the kingdom, if his death, which happened in 1458, had not prevented it. Callixtus is represented by contemporary writers as a man of abilities, of great address and experience, and one of the best canonists of his time: but like other popes, he was betrayed into improper conduct by nepotism. His only literary remains are some epistles and bulls. Bower, vol. vii. Motheim, vol. iii.

CALLO, in Geography, a plain in the jurisdiction of Quito, South America, so called from a palace of the Incas, which bears this appellation, and the ruins of which are still seen at the extremity of the plain running northward from Lataguina. See Quito.

CALLO-port, lies on the coast of Chili, in the south Pacific Ocean, four leagues N. from Solango island. See lat. 1° 10'. W. long. 86° 0'.

CALLONIA, in Ancient Geography, a town of Sicily, according to the Itinerary of Antonine, thought to be the same with the Caulonia of Steph. Byz.

CALLONITIS, in Geography, a country of Asai, in Affyrin, on the confines of Media, near mount Zagrus.

CALLOO, a fortress of the Netherlands, on the Scheldt, where the Dutch were defeated by the Spaniards in 1638; five miles W. of Antwerp. See lat. 51° 15'. E. long. 4° 19' 10".

CALLOSA, in Entomology, a species of Arts of a shining black-blue colour, with a white lip, and callous dot of the fame on each side of the thorax, before the wings. This is an insect of small size, and inhabits Italy. Fabricius.

CALLOSITY, in Surgery. See Callus.

CALLOSUM corpus, in Anatomy, denotes a whitish hard substance, joining the two hemispheres of the brain, and appearing when the two hemispheres are drawn back. See Brain.

CALLOT, JAMES, in Biography, a celebrated draughtsman and engraver, was descended from a noble family, and born at Nancy in Lorraine, in 1593. His passion for the arts was so strong, and discovered itself at so early a period of his life, that at the age of 12 years, he secretly left his father's house, and determined to seek improvement in Italy. But being delinquent of money, he joined a company of Bohemians (or of rolling gypsies), with whom he travelled as far as Florence. Here he was taken notice of by an officer of the grand duke, and placed for instruction under Remigio Canta Gallina, who was both a painter and engraver. When he left Gallina, he purposed his journey to Rome; but meeting with some merchants from Nancy, who knew him, they took him back to his family. Soon after he made a second elopement, and from Turin he was brought home by his brother. At length, his father finding that his inclination for the arts was invincible, acquiesced in his indulgence of it, and sent him to Rome; where he industriously applied to drawing, under Giulio Parigi. Being desirous of acquiring a faculty in handling the graver, he put himself under the instruction of Philip Thomassin, and having made considerable improvement, he afterwards went to Florence.
rence, where he was employed, and particularly encouraged by the great duke Cosimo II. At this city he first began to etch, and he executed several small subjects with great success. Upon the death of the duke, for whom he performed many curious works, he returned to Nancy, married, and became a great favourite with the duke of Lorraine, who granted him a pension. In this interval of his life, he designed and engraved the siege of Breda; and at Paris he engraved for Louis XIII. the sieges of Rochelle and of the island of Rhé, and several others. On occasion of the troubles of Lorraine, which terminated with the siege and capture of Nancy, he determined to return with his wife to Florence; but death prevented the execution of his purpose, March 28, 1635.

After the reduction of Nancy in 1632, he was desired by Louis XIII. to draw and engrave the siege of that place; but this business he declined, alleging, that he did not think it consistent with the respect which he entertained for his prince, and the love which he bore to his country, to represent anything that should appear to their disgrace. When a counsellor insisted on his gratifying the king's wishes, and enforced the requisition with a menace, that he should be compelled to obey, he boldly replied, "I will sooner disable my right hand, than be constrained to do any thing contrary to my honour." The king was pleased with this magnanimous reply, and offered him a pension of 3000 livres if he would attach himself to his service. Callot gracefully refused the offer, preferring the love of his country to the amassing of a fortune.

This artifl engraven in several styles: the first of which was an imitation of his master Costa Gallina. He afterwards worked altogether with the graver; but without success. His next style was the mixture of the point and the graver, with coarse broad hatchings in the shadows. But his best manner is that, which appears to have been executed with the greatest freedom, by which he has expressed, as we may say, with a single stroke, variety of character, and correctness of design. He is said to have been the first who used hard varnish in etching, which has been found much superior to that which was before adopted. The fertility of invention, and the vast variety, found in the works of this excellent artist, are astonishing. It could hardly have been supposed possible to combine so great a number of figures together as he has done, and to vary the attitudes, without forced contrivance, so that all of them, whether single figures or groups, may be easily distinguished from each other, even in the marks of shadow; more especially when it is considered, that they are often exceedingly minute. On a cursory view of some of his most admired pieces, the whole appears confused and without harmony; but a careful examination discovers the riches, the beauty, the taste, and the judgment which are bestowed on the disposition of the figures, the management of the groups, and the variety and propriety of the attitude. The works of this master are very numerous and various. In representation of all the varieties of human life, from beggars and peasants to knights and nobles, he excelled; characterizing all with the nicest touches of nature. Of his subjects many are of the most painful and shocking kind, such as public executions, the miseries of war, and the like; many are grotesque and fantastic, and exhibit a strong imagination.

The number of Callot's works is fixed to amount to 1500 prints. His etchings are most esteemed, and collections of them are deemed very valuable. Strutt enumerates the following prints; viz. "The Murder of the Innocents," of which that engraved at Florence is the most rare; a fine impression of it being found withdifficulty:—"The Marriage of Cana in Galilee," from Paolo Veronese;—"The Passion of Christ," the first impressions of which are very scarce;—"St. John in the Island of Palma;"—"The Temptation of St. Anthony;"—"The Punishments," exhibiting the execution of several criminals; and—"The Miseries of War;"—"The Great Fair of Florence;"—"The Little Fair," otherwise called "The Players at Benti," one of the most rare of Callot's prints;—"The Tilting, or the New Street at Nancy;"—"The Garden of Nancy;"—"View of the Pont Neuf;"—"View of the Louvre;" and "Four Landscapes." Callot was very regular in his mode of living, and exact in his religious observances. Feibehn, Strutt.

CALLOUS, in Surgery, denotes indurated or hardened. See CALLUS.

CALLOUS, egg., ova callosa, the longer and better form, supposed to contain male chicks; having a denser white, and a richer flavour than the rest. See EGG.

CALLULO, in Geography, a town of Asiatic Turkey, in the province of Diarbekir; 60 miles N.W. of Rabba.

CALLUNDBORG, or KALLUNDBORG, a town of Denmark; 60 miles W. of Copenhagen.

CALLUS, in Surgery, is a preternatural hardnes or in-duration of any fleshly part of the body; and, not frequently, this term is applied to the sub stance by which fractured bones are spontaneously united to each other. In this latter sense, we say, "the callus has not formed;" i.e., the bony union is incomplete; "the callus is exuberant;" i.e., the ositive matter is very abundant. A callousy, or preternatural hardnes of the skin takes place either from external friction (as in the formation of CORNS), or from an internal cause, which probably consists in a morbid action of the exhalent arteries. In the hard and thickened state of the skin which constitutes the disease named a CORN (which see), there is found to be an accumulation of dry cuticular substance, in numerous layers, somewhat resembling an onion. The lamina of horny cuticle which forms on the hands and feet of hard-working people, is entirely devoid of fenfation, and may therefore be scraped or cut with impunity.

Mr. Leeuwenhoek examining the callus formed on the hands and feet, observed that it was a sub stance composed of several layers of particles so loosely connected, that it was a wonder they could hang together; on putting a piece of this into fair water, after it had stood a considera ble time to steep, he found that the particles of which it was composed, would easily separate from one another with a little touch of a quill, and these separated particles put into a drop of water, and examined before the microscope, were found to be all of the same regular shape, which was like that of a veaver's thistle, being broad in the middle, and pointed at each end, with a line in the middle like those upon the uppermost, or outside skins of fruits, or of our bodies, but generally irregular. These pieces were thick in proportion to their size; and when they are put into water, and separated again, they naturally form a great number of other particles, all of which are of the same regular figure with the original piece. Phil. Trans. Needs. vol. 73, p. 160.

By this we see the reason of the increase of thickness of the skin of the hands of those labour hard, and of the feet of such people as walk much, which is wholly owing to the addition of a vast number of these thistle-like particles, which form combinations together; but these so loosely, that it is no wonder they are so easily separated on moulding.

The way to avoid such callousness of the skin is to wash and
callus, when pieces of bone is in reality nothing more than a kind of fibrous tissue formed by a process of nature very similar to the growth of any other part of the body; but the ancients had an idea of barley callus being formed by the cutis, and gradual concretion of a glutinous matter, like the white of an egg; and they supposed that all fractured bones were glued, as it were, by the intervention of this jelly, as two boards are glued together by a carpenter. See Fracture.

To facilitate the growth of callus on the union of broken bones, the patient should take strengthening remedies, and be put on a generous diet; and if this does not produce the intended effect, the broken extremities of the bones may be rubbed together, or friction may be kept up externally, so as to cause a moderate degree of inflammation. Several surgeons, on finding that a fractured bone would not unite, have made an incision down to the bone, and fawn off a portion of it, or rasped it with a rough file, in order to excite the vessels to action; in some of these cases the offish process has been revived, and a union has taken place, but generally this experiment has failed, as the growth of bone is more slow and difficult to produce than the regeneration of soft parts, on account of their difference in structure.

CALLYCHTHIS. See Callithyris.

CALLIDUM, in Ancient Geography, a strong cove of Asia Minor, situated on one of the limbs of the mount Olympus in Phrygia.

CALLIONIMUS, in Botany. (Cf. Hor.) See Convolvulaceae mollis.

CALLYSIND, in Geography, a river of Hindoostan, which runs into the Chumbul, in the circuit of Kotta.

CALM, in Sea Language, that state of the air and water when there is no wind stirring. A calm is more terrible to a sea-faring man than a storm, if he has a strong ship and cabins有足够的; for under the line executive boats sometimes produce such dead calms, that ships are obliged to lay two or three months without being able to flit one way or other. Two opposite winds will sometimes make a calm. This is frequently observed in the gulf of Mexico, at no great distance from the shore, where some gale or land wind will to pose the general calmerly wind, as to produce a perfect calm.

Calm are never so great in the ocean as in the Mediterranean, by reason the flux and reflux of the former keep the water in a continual agitation, even where there is no wind; whereas there being no tides in the latter, the calm often makes the sea extremely still, that the face of the water is as clear as a looking-glass; but such calms are almost constant presages of an approaching storm. The coast about Smyrna, a long calm is reputed a prognostic of an earthquake.

When a ship is close under the ice of another, the windward vessel is said to be calm under the lee. A ship is also said to be calmed when near the land, which keeps the wind from it.

It is not uncommon for the vessels to be calmed or becalmed, as the sailors express it, in the road of the Levantine winds, in places where they ride near the land. Thus between the two capes of Cape Verde: the wind, and Cape Antonio in Cuba, the sea is narrow, and there is often a calm produced by some force of a land-wind, that poseth the Levantine wind, and renders the whole perfectly still for two or three days.

In this case, the current that runs here is of use to the ships, if it sets right; when it sets to the right, a ship will have a passage in three or four days to the Havana; but if otherwise, it is sometimes a fortuitous or three weeks fails; the ship being embayed in the gulf of Mexico.

When the weather is perfectly calm, no wind at all stirring, the sailors try which way the current sets by means of a boat which they send out, and which will ride at anchor, though there is no bottom to be found, as regularly and well as if fastened by a strong anchor to the bottom. The method is this: they row the boat to a little distance from the ship, and then throw over their plummet, which is about forty pounds weight; they let this sink to about two hundred fathoms; and then, though it never reaches the bottom, the boat will turn head against the current, and ride as firmly as can be.

Calm Latitudes, are situated in the Atlantic ocean, between the tropic of Cancer, and the latitude of 29° N.; or they denote the space that lies between the trade and variable winds, because it is frequently subject to calms of long duration.

Calm Point, in Geography, lies on the N.W. coast of North America, within Bristol bay, on the north side.

CALMAR, a sea-port town of Sweden, in the province of Smalnd or Smoland, near the Baltic Sea, separated from the isle of Oeland by a strait, about seven miles broad in the narrowest part, and strongly fortified by walls, ditches, a castle, and redoubts. It is about a mile in circumference, and contains 450 houses. The streets cross each other at right angles. The inhabitants carry on a small trade, exporting chiefly planks, alum, and hemp, and poffels, besides small craft, about 70 vessels, from 100 to 300 tons burthen. Near the town is the castle, standing on an eminence, and the only remains of its ancient magnificence. The building has been constructed at different intervals, and exhibits a motley mixture of Gothic and Greek architecture. Over one of the doors is an inscription, John III. 1568. But part of the manor must be much older, as the apartment in which the deputies of the three kingdoms, Sweden, Denmark, and Norway, used to assemble for the election of their common sovereign till 1616; it is 44 feet long and 30 broad. This palace, once the residence of the celebrated Margaret, and remarkable in the history of this country, is converted into a distillery. Calmar is celebrated for the union, which took place in it, in 1397, and which stipulated, that the same monarch should rule over Denmark, Sweden, and Norway, and be chosen by the deputies from the three kingdoms assembled at Calmar. During the whole period in which these regulations subsisted, Sweden was a tributary kingdom to the sovereigns of Denmark;
mark; the union was upheld by the vigour and abilities of Margaret; but under her weak and unwarlike successors, it entailed on Sweden all the horrors of foreign invasion and intestine discord. From this state of alternate oppression and anarchy, it was rescued by the valour and prudence of Gustavus Vasa, on whom the gratitude of the Swedes conferred the dominion of the country which he had delivered: they renounced, in his favour, the right of electing their kings, and declared the crown hereditary in his male issue, A.D. 1546. See SWEDEN. N. lat. 56° 30' 30". E. long. 16° 24° 45'.

CALMET, DON AUGUSTIN, in Biography, a celebrated commentator on the Bible, was born near Commerci, in Lorraine, in 1672, and became a Benedictine of the congregation of St. Vannes, in 1688. Having passed through the usual course of philosophy and theology, he was employed in teaching them to the younger part of the community, till in 1704 he settled as sub-prior in the abbey of Munster, in Alarce, where he professed over an academy of 8 or 10 monks devoted to the study of the Scriptures. Thence he composed his commentaries on the Scriptures, published in French from 1727 to 1716. In 1718 he was appointed to the abbacy of St. Leopold in Nancy; and in 1728 he was elected abbot of Senones. The title of a bishop in partibus was offered him, but he declined accepting it. After a course of literary labour, in which he displayed great erudition and industry, though not always equal taste and judgment, he died, highly esteemed, in 1757. His principal works are, "A Literal Commentary on all the Books of the Old and New Testament," 23 vols. 4to.; reprinted in 26 vols. 4to. and 9 vols. folio; and abridged by Rondet, in 14 vols. 4to. "The Difficulties and Preface of these Commentaries, printed separately, with 19 new Differen-
tations," 3 vols. 4to.; "The History of the Old and New Testament," 2 vols. 4to.; reprinted in 4 vols. 4to., and 7 vols. 12mo.; "Historical, critical, and chronological History of the Bible, with Figures," 4 vols. folio; in which the matter of the commentaries is reduced to alphabetical order, in the form, and under the title of a dictionary, published in 1730, in 4 vols. folio. Although the author’s commentaries did not escape censure, and were treated by father Simon with a considerable degree of asperity and contempt, yet, being distinguished by moderation and exemption from polemical disputes, they were perused by Protestants as well as Roman Catholics; the work became very popular; and within a few years after its publication, there were several editions of it in French, Latin, Dutch, Italian, Spanish, English, and other languages; and it is still considered as a standard work. It has been much and desirably valued on account of many excellent elucidations which it contains of difficult passages in the Holy Scriptures, beautiful delineations of Oriental manners, and lively, entertaining histories extracted from authors little known even among the learned. A new and valuable edition of it with considerable retrenchments and additions, and a new set of plates, under the direction of Mr. C. Taylor, appeared in London in 1797, &c. The additions form a separate volume under the title of "Fragments," with a great variety of appropriate and well-executed engravings. Other works of Calmet are "Ecclesiastical and civil History of Lorraine," 5 vols. folio, reprinted in 5 vols.; "Catalogue of Writers of Lorraine, folio; "Univerfal History, sacred and profane," 15 vols. 4to.; "Difficulties on the Apparitions of Angels, Demons, and Spirits, and on the Vampires and Ghouls of Hungary," a small collection of reveries; and " Literal, Historical, and Moral Commentary on the Rule of St. Benedict," 2 vols. 4to. containing much curious in-
formation on ancient customs. Calmet deserves notice also as a writer on Hebrew music in his commentary on the psalms: as a small volume, entitled "Trofe d’Antiquitez," compiled from his sacred writings, not only concerning the music of the Hebrews, but ancient music in general, with representations of musical instruments, was published at Amsterdam, in 1722.

Ancient music, in general, is almost become an unprofitable and hopeless study; but that of the Hebrews, the most ancient of all, is now included within the confines of conjecture; and Don Calmet’s conjectures are, perhaps, as probable as those of any one of the numerous authors who have written on the psalms, and exercised their sagacity and ingenuity in expounding and defining what some have long since thought involved in crimson darks. However, Kircher, Merian, and Don Calmet, have thought otherwise: but whether they have taught their readers to see in the dark, as some animals are fappled to do, we are unable to say.

CALMENDA, in Geography, a town of Portugal, not far from Braga.

CALMINA. See CALAMO.

CALMINERA, Cape, lies on the coast of Coromandel, in N. lat. 16° 15’. E. long. 79° 47’. a few leagues S. of Negapatam.

CALMINI, a town of France, in the department of the Upper Garonne; 7 leagues S.S.E. from Toulouf.— Also, a town of France, in the department of the Averno; 2 ½ leagues S. of Rhodiz.

CALMUCS. See KALMUC.

CALN, EAST and WEST, two townships of Chester county, Pennsylvania, in North America.

CALNE, a market and borough town of Wiltshire, in England, is situated on the banks of the Marhm river. This ancient borough was endowed with peculiar privileges, previous to the Roman conquest, and according to the domesday-book it never yielded or paid taxes, ‘‘to that it is not known how many hides are therein.” The kings of the Wilt Saxons had a palace here; and from the names of Castle Street and Castlefield, it is generally imagined that a castle reared its massive walls in the neighbourhood of the town. Here was also an hospital of black canons, dedicated to St. John, and valued, at the dissolution, at 21. 25. 6d. per annum. Calne is an ancient borough by prescription, and lends two members to parliament, who are elected by fifteen voters; the first return was made in the reign of Edward I. The corporation consists of two guild rewards, who are chosen annually, and an unlimited number of burgesses. Previous to February 25, 1733, the privilege of election was vested in all the inhabitants having right of common; but it was then determined, that the power of choosing members resided with the ancient burgesses only; and that the right of returning members was in the guild rewards. The mayor, prebend, and parsonage of Calne, are held by knights for several lives, from the dean, chapter, and treasurers of Shriving. In the reign of Edward the martyr, a great synod or convocation was held here, at the instigation of Dunstan, archbishop of Canterbury, to determine the controversy between the monks and secular prelates, which had commenced in the synods at Winchester, and Caletoge, in Cambridge-shire. From the importance of the question, the principal nobility, as well as the bishops and seculars, attended. During the debate, while bishop Beorhthelm was pleading for the priors, the timbers of the assembly room gave way, and the structure fell to the ground; most of the seculars were buried beneath the ruins; but
but the rest of Dunfan, present of the synod, and chief advocate for the monks, alone flood firm. This circumstance, in that age of superstition, was continued into an interposition of Heaven in their favour; but subsequent writers have assigned a more natural reason, and have not hesitated to assert, that Dunfan had caused the beams to be cast abroad, taking care that his own flesh should remain fixed. This account seems, from the singular disposition of Dunfan, to be most probable. Calne has, of late years, greatly incresed in size and population; it contains 785 houses, and 3577 inhabitants, most of whom are employed in the manufacture of broad cloth, serge, and other articles of the clothing business. Here are three meeting-houses for Presbyterians, Aulbapists, and Quakers. The church is a large structure, dedicated to St. Mark, with a handsome square tower at the north-call end. The town is plentifully supplied with water from two streams, one flowing from the foot of the hills near the village of Caldon, the other from Cherhill; these rivulet unite, and run through the centre of the town, giving motion to many fulling and grist-mills. A Free school was founded here by John Bentley, esq. of Rich mond in Surrey; who, by his will, dated September 29, 1632, gave certain lands, called Frickett's Fields, adjoining to Lincoln's Inn, then worth about £50, for its erection and maintenance for ever. By the donations of Sir Francis Bradgman, knt. certain exhibitions are established at Queen's College, Oxford, for the benefit of boys born in the county of Wilts, and educated in this free-school. "The master to keep a regular grammar school, and teach seven boys the Latin and Greek tongues, and otherwise qualify them for the University."

About three miles east of Calne, on the side of the London road, is a monument, which attracts not only the notice of all travellers on this road, but also the observanee of people over the north part of Wilts, and many parts of the adjoining counties. This is the figure of a large White Horse, that was formed by parsing off the turf from the side of the chalk-hill; the horse is represented in a trotting position, and executed with a pretty correct outline; it was cut at the expense of Dr. Allsop, of Calne, about twenty-five years ago, and measurs from the head to the tail about 157 feet.

About two miles well of the town is Bowood, the seat of the marquis of Lansdown. The house is a large, commodious, but irregular structure, and contains some fine pictures, among which is a valuable collection of portraits of eminent characters. The park and pleasure grounds are extensive, and diversified with much beautiful scenery. A distinguished feature, and ornament of these grounds, is a large lake, which winding beneath some fine hanging woods, constitutes an interesting object; at the head of this lake is a singular picturesque cafeade, which, though wholly artificial, is sufficiently admired for its approximation to the irregularities of nature.

CALNEH, in Scripture Geography, a city in the land of Shinar, built by Nimrod, and at one time the seat of his empire (Gen. x. 10); supposed to be the Calno or Calno of Isaias (ch. x. 9) and the Channeh or Canneh of Ezekiel (ch. xxvi. 23.) Tho prophets join it with Haran, Eden, Affyrria, and Chilmin, which traded with Tyre; and hence it is inferred, that it must have been situate in Mesopotamia. It is said by the Chaldean interpreters, and also by Eusebius and Jerome, to be the same with Ctephphon, which was seated on the Tigris, about three miles distant from Seleucia, and for some time the capital of the Parthians. This opinion is confirmed by the name Chalomes, evidently derived from Chaline or Chalno, which was given by the Greeks to the country about Ctephphon. Wells's Geog. of the Old Testament, vol. i. p. 229.

CALOBRA, in Geography, the most considerable harbour in the island of Majorca, both for its secure entrance, and the fine country that surrounds it; as well as for the springs of fresh water that are near it.

Gen. Ch. Cal. perianth one-leafed, permanent, five-parted; segments egg-shaped, acute, befit with strong hairs on the outside; the edges slightly revolute. Cor. petals five, lanceolate, obtuse, spreading, channelled, keeled, waved, pubescent, three times the length of the calyx; nectaries five, fixed to the receptacle within the petals, and shaped like them, linear-lanceolate, aw-shaped at the tip, terminated by a gland, smooth, filery-glandular, narrower than the petals, but of the same length. Stam. filaments five, equal, the length of the corolla, one of them generally barren; anthers egg-heart-shaped, furrowed, fixed longitudinally to the filaments. Pist. capsule peduncule, egg-shaped, bluntly five-angled, befit with strong points, five-furrowed, five-celled, five-valved. Seeds in pairs, somewhat triangular, convex on the back, smooth.

The corolla, nectary, and filaments, all vary in the number of their parts, which are sometimes four, generally five, and very rarely six; so that in fact the capsule alone forms the essential character.

CALOGERI. Καλογέρος, or Caloysers, monks, or religious, in Greece, both male and female; inhabiting particularly mount Athens, but disseminated also throughout all the churches of the East. They follow the rule of St. Basil, and make vows like the western religious. Tourneroy says, the females are most of them only a more moderate sort of Magdalen's, who, as they grow old, make a vow to practice these virtues they had much neglected in their youth; and retire into convents to lead a life somewhat less scandalous than before, under the eyes of a superior or bczgumenos, who is far from being too severe.

Amongst these monks, whatever their name imports, it is not uncommon, says Somnini, (Travels in Greece, p. 228.) to meet with young boys, from 10 to 12 years old, clothed in their habit, which consists of a plain, long, black gown, confined by a girdle. These friars, he says, are very dirty, and very ugly, from the habit which they contract of neglecting their exterior, and of taking care neither of their beard nor hair. Their character, he adds, is formed of hypocrisy, haughty and gross ignorance, meanness and treachery; though they wish to be reckoned to possess great knowledge, and a reputation for sanctity, in order to secure from the people attention and respect. Their vows are obedience, chastity, and abstinence. The first and last of these vows
tows are observed with sufficient exactness; but the second is more generally disregarded; and some of them are accented a degree of brutality, in the infringement of laws which nature, more powerful than all the institutions of convicts, disfavors. The Caloeyes, in some places, are divided into Cacophobes, Anarchitases, and Acritases, or hermits; the life of which is the most severe and reclusive.

The Turks also use the word Caloeyer for their dervises, or religious mullahmen. See DERVIS.

CALOGERIZA, in Geography, a town of European Turkey, in the province of Bulgaria; 64 miles E. of Sofia.

CALOGERO, St. a town of Sicily, in the valley of Mazara; 216 miles E. of Mazara, and 2 N.E. of Saccra or Sciacca.—Also, a mountain of Sicily, one of the highest in the island, next to Etna, on the summit of which is a refuge of hermits.

CALOIGURO, St. a cape on the east coast of Sicily; 9 miles E. of Lentini.

CALOIERA, a small Greek island in the Archipelago; 5 leagues south of Andros.

CALOITIAM, in Zoology, a species of Trichoda of a broadish oblong shape, with shining horns on the anterior part. Mill. Hist. Verm. This kind is found in water where-in vegetables have been infested. It is flat, obtuse at both ends, with a black spot and a few bristles near the posterior extremity.

CALOMEL, in Pharmacy. See Mercury.

CALONE, in Ancient Geography, a place of Germany, on the route from Lugdenum Batavorum, to Argentorum, between Gelduba and Vetera. Tit. Anton. Collarins places it at Kalen-Hafen; but M. d'Anville refers it to a passag of the arm of the river Kelnet or Kendel. It was near the Rhine in Germania Secunda, S.E. of Colonie Trajana.

CALONERY POINT, in Geography, a cape on the east coast of the island of St. Vincent; one mile S. of Young Point.

CALONI, a town of European Turkey, in the island of Metelin, in a gulf to which it gives name, in which are two Greek convents.

CALONNEA, in Botany. (Buchoz.) See GALARDIA.

CALONOSOS, in Ancient Geography, a mountain of Arabia, at the entrance of the Persic gulf. Arrian.

CALOO SANIO, lies on the coast of Holland, between the Bodkil to the southward, and the coast Gatt channel to the northward.

Gen. Ch. Cal. four, two or one-leaved; leaves roundish, concave, coloured, deciduous, sometimes wanting. Cor. petals four, roundish, concave, spreading. Stam. filaments numerous, thread-shaped, short; anthers oblong, crept. Fil. germ superior, roundish; style thread-shaped, the length of the flamen, or none. Peric. drupe globular, fleshy. Seed; nut globular, rather acuminate, large.

Sp. 1. C. inophyllum, Linn. Sp. Pl. Gær. Tab. 43. fig. 1. La Marech, Pl. 450. (Ponna or ponna-maceam, Rheed. Mal. 4. Tab. 38. Rai. Hist. 1525. Bintangor maritima, Rumph. amb. 2. Tab. 71.) Arbor indica, mali medicea amphibris foliiis, Pluk. am. 41. Tab. 147. fig. 3. Inophyllum...
There are perhaps few subjects respecting which a more remarkable variability of general opinion has been evinced, than with regard to the existence or non-existence of this principle. Are the phænomenal effects of heat produced by the operation of a material fluid \textit{ad generis}, or is heat merely an affection of matter, confilting in internal vibrations and collocations of its particles, or in some other mode of corporeal action of which we are ignorant;—and is there consequently no such thing as caloric?

Zeno, it appears, conceived that heat was material. We have a curious discollation on this subject in Cicero's book, 

"De Naturæ Deorum," consisting of a dialogue between an epicurean, a platonick, and a flosick, respecting the Supreme Power, which the latter supposes to reside principally in the stars; and it is remarkable that the author has made speak of the materiality and nature of heat very nearly as we do at the present day. "That heat is combined with water," he says, "its liquefaction itself sufficiently proves, nor can it either freeze or congeal into snow or hoar-frost without suffering that heat to escape." 

"Even the air, however cold it may be, is by no means devoid of heat; indeed it is combined with a great deal of heat;" and more to this effect.

This indeed appears to have been the most general notion respecting this part of the subject till about the time of Lord Chancellor Bacon, who in his tractate "De Formâ Calidî" considers heat as the effect of an intellel motion or mutual collocation of the particles of the body heated; an expansive undulatory motion in the minute particles of the body, by which they tend with some rapidity towards the circumference, and at the same time incline a little upwards; which idea was also with some modification adopted by Descartes, Newton, Boyle, and the other mechanical philosophers of that and the succeeding age. The chemists, however, whole opinions, at least, poifles that degree of authority which arises from their being most used to the observation of the effects of this agent, seem to have still retained a strong notion of the materiality of heat, which, in consequence of our improvement in chemical science, again became general, and continued so till the experiments of Count Rumford, which appeared to shew that it was impossible and capable of being produced ad infinitum, from a finite quantity of matter, again threw some doubt on this question.

It is known that when water freezes, a portion of heat is given out by it during the congealation, which is so considerable, that if we were to conceive it to be transmitted to and imbibed by an equal quantity of water at the temperature of 32° of Fahrenheit's thermometer, the latter would be heated no less than 146°, or to 172°. If, therefore, heat were a ponderable substance, it might be imagined that a given quantity of water would become lighter when frozen in a vessel hermetically sealed. Count Rumford accordingly made this experiment with great care by the help of a balance of extreme accuracy; but the result was, that the ice produced appeared to be of precisely the same weight as the water had originally been of at the temperature of 61°, viz. 4214.28 grains, from which he infers, that all attempts to discover any effect of heat on the apparent weights of bodies will be fruitless.

The other deduction, of the possibility of producing an inexhaustible supply of heat from a given quantity of matter, was made from the following experiment. The Count caused a cylinder of brass to be turned 7½ inches in diameter and 9.8 inches long, which was bored like a cannon with a calibre 3.7 inches in diameter, and 7.2 deep, so that the bottom was 2.5 inches in thickness. The hollow cylinder contained 385½ cubic inches of brass, and weighed 113.13 lbs. avoirdupois. By means of the engine used for boring cannon in the arsenal of Munich, a blunt borer or flat-plate of hardened steel, 4 inches long, 0.63 inch thick and 3½ inches wide, was kept with one of its extremities, whose area was about 2½ square inches, pressed against the bottom of this hollow cylinder on the inside with a force of about 10000 lbs. avoirdupois, whilst the latter was turned about its axis with a velocity of 3½ revolutions in a minute. The cylinder was in one experiment covered on the outside with a coating of thick flannel to prevent the access of heat from the atmosphere; in another the borer was made to work through a collar of leathers so as to prevent the access of air also to the interior of the bore; in a third, the whole cylinder was immerced in water, the borer still working through a collar of leathers so as to prevent its access to the interior of the bore; in a fourth, the collar of leathers was removed, and the water had access to the bottom of the interior of the cylinder where the friction took place. The result was, that in all these cases heat was generated by the friction in sufficient quantity to cause about 264 lbs. of ice-cold water to boil in two hours and a half, or at about the rate at which it would have been produced by 9 large wax candles; the capacity of the brafs for heat, or its power of producing it by friction, did not appear to be diminished, and it seemed as if this generation of heat would have gone on for ever if the friction had been continued: the source was inexhaustible. Now, as any thing which an intacted body or system of bodies can continue to supply without limitation cannot possibly be a material substance, the Count's inference is, that heat is not of this description, but that it must be an effect arising from some species of corporeal action among the constituent particles of the body.

We will confess, however, that we conceive neither of these experiments nor any other with which we are at present acquainted to be conclusive in favour of the immateriality of caloric. Omitting the question, whether gravitation is essential to matter, we may observe that there may be an infinite series of material substancess, each a million of times rarer than the preceding, of which, though the weight of the heaviest be imperceptible by our nicest balances, the lightest may still be ponderable. Any instrument which we at present possess would fearfully enable us to detect the weight of a fluid which was only a thousand times lighter than atmospheric air.

The other experiment affords an argument against the materiality of this principle, to which it is perhaps somewhat more difficult to give a distinct and decisive answer; and yet, notwithstanding the precautions which were taken, it is by no means demonstrative, that the heat which was evolved was not derived from contact, for there is no abfinity in supposing, that a body may be receiving caloric in one state or at one part of it, and giving it out in another. We have an instance of the simultaneous attraction and emission of a subtile fluid, the materiality of which is admitted by every one, in the case of an excited electric, which at the same time receives the fluid from the rubber, and communicates it to the conductor. In Count Rumford's experiment we must recollect, that the whole apparatus was immerced in a great bath of caloric, the atmosphere.

With regard to this part of our subject, we ought also not to omit, that in another experiment of the fame author, heat was found to be communicated through a Torricellian vacuum. Now it is manifest, that in such a vacuum there could be nothing to communicate or propagate motion. Heat therefore must be material: the conclusion is almost physically certain. Without
Without further inferring, however, that we can conclusively demonstrate the existence of caloric, it at least appears upon the whole, that, in the present state of our knowledge, we ought rather to consider it as a material substanee, because of the two theories, that which supposes it to be 30 is infinitely the most intelligible, the most agreeable to the analogy of nature, and the least exceptionable; and we shall accordingly regard it as an elastic fluid or generator, capable of pervading with various degrees of facility, all the solid bodies with which we are acquainted, and of being imbibed and retained by them in different proportions according to their respective degrees of specific attraction or capacity for it. See Capacity.

It will easily be conceived that from the elasticity and power of pervading other substanees, which we have attributed to this fluid, it must necessarily follow, that whenever a body is by any means charged with a larger quantity of it than is proportional to its mass and capacity, when compared with those of other bodies in its vicinity, the surplus will be communicated to those other bodies, until the density of the fluid in every body in the system becomes equal; in like manner as a quantity of air thrown into one of a number of vessels communicating with each other will pass from it to the others, until it becomes distributed amongst the whole of them in proportion to their respective capacities, or till it becomes of equal density in all of them. This state of density or compression of the caloric, contained in a body, constitutes what is called its temperature; see this article.

The celerity and facility with which this fluid pervades different substanees is however extremely various, as may be shown by the following experiment. Take a small cylindrical earthen or wooden vessel, between three and four inches in diameter, and infert into it, through holes drilled in its bottom for that purpose, several wires, about an eighth of an inch in diameter, and fix or seven inches long, of equal size in every respect, but of different metals, as gold, silver, copper, iron, brass, and zinc; and also two small rods, one of glass and the other of wood, of equal dimensions with the wires, so that they may each of them project about half an inch on the inside of the vessel, the rest of them being on the outside, and forming a kind of stand for it. Dip a portion of the inferior extremities of these wires and rods into melted wax, so that they may become equally coated with it. When the wax has cooled, fill the vessel with a heated fluid, as boiling water or melted lead, and observe the intervals between the time of filling it and the melting of the wax, which intervals will indicate the relative conducting power of the substanees. Dr. Ingenhouz tried this experiment, though in a somewhat different manner, with wires of silver, copper, gold, tin, iron, steel, and lead, whose conducting powers lie conceived to be in the order in which we have enumerated them, though he found some differences in the results, except with regard to the silver and lead, of which the former always appeared to be the belter, and the latter the worst conductor. In the experiment which we have described it will be found, that the conducting powers of glass and wood are almost infinitely smaller than those of any of the metals which are the best conductors known. Fluids of every kind are almost perfect non-conductors; and light tenuous substanees, or such as contain fluids in their interstices, conduct heat with great slowness and difficulty.

This difference in the conducting powers of various substanees is the source of many pratical conveniences and inconveniences. The cellular texture of organized substanees enables them to withstand the effects of change of temperature in the atmosphere, by refluxing the passage of this fluid, and the wooden handle of a tea-pot, and the cloth made of for handling hot irons, are familiar examples of the economical application of this property. An iron door to a furnace will be red hot before the furnace itself, if of any earthly composition, is heated in any considerable degree. Large iron bars or cylinders are made to pass from the fire for the purpose of communicating heat to those whose which are constricted at the side of kitchen-ranges, and a poker put into a low fire improves it by promoting a similar communication amongst the different portions of the fuel through which it passes.

We will, in the next place, consider very shortly the effects arising from the condenation or rarefaction of this fluid in bodies. By the former their temperature is elevated, or they are heated; by the latter it is depressed, or they become cooled.

In our investigation of the most universal operations of nature we generally find that the more immediate instruments employed for the production of the effects which we perceive are two counteracting powers, by whose co-operation and mutual counterpoise the necessary equilibrium is preserved, and the purposes of their creation effected with greater regularity than would probably result from the employment of a single agent. Thus, gravity is, as we know, counteracted by inertia, that tendency which all bodies have to continue in a state of rectilinear motion, when once they are thrown into it by the impulse of force. The effects of cohesion, a no less universal principle than gravity, are in like manner restrained and modified by the agency of caloric; and, as without inertia all the celestial bodies would be drawn together into some one part of extended space, so, without heat all the matter in the universe would become a conglomerated and concrete mass; and fluidity, organization, vegetation, and life could have no existence. Solids become first expanded, and then liquefied by its influence, and liquids assume the aérical state. It is essential to the idea of a solid body, that it should in a certain degree resist both compression and dilatation, that is, that its particles should repel each other when brought nearer together, and attract each other when farther separated within certain limits, and it is incontrovertible, that they can only remain in a quiescent state by the equilibrium of these opposite forces. The latter of these constitutes cohesion, and the existence of the former is, perhaps, attributable to the substanee of which we are now speaking. Be this as it may, it is at least a fact, that the repulsive energies of these corpuscles are increased, and the sphere of action enlarged by its influence, for the body becomes expanded; that is, this equilibrium no longer takes place, unless its molecules are removed farther from each other than when it was at a lower temperature. Elevate its temperature still farther, and the body fuses; that is, the attractive power of its particles becomes annihilated or wholly counteracted, and they are only kept together like a quantity of shot by the action of gravity, operating independently on each. Incrassc still the action of heat on the body, and the sphere of repulsion of its particles, or the distance, to which this power operates, again becomes much farther extended, perhaps infinitely so; it is now sufficient to overpower the action of gravity, and the body becomes resolved into an effusive fluid. We know of no substance which is capable of refilling the power of this universal solvent. Gold itself may be expanded into vapour by the action of heat, and these effects are always producible by the same cause, so is it, at least, probable, that the converse of this is also true; that whenever a substanee is formed in a state of fluidity it is attributable solely to this cause, and that the abstraction of the caloric, by which it is holden in solution, would again reduce it to a solid. Mercury is, we know,
Concert, it four a all whereas, or trata enjoy their now town Geography, Lutheran per- town medal, round cality occasioninjj. It and Colonia (lyled famous the 1612, cup, and ca- the to fea-port Morungen, and Fribourg, and calotte, a species of Lacerta, with a long round tail, and the fore part of the back, and hinder a part of the hind dentated. Gumelia. This is the iguana cal- lotes of Laur. Amph. Its body is carunculate, with acute scales beneath, and lanceolate spinos on the back. Found in Asia, particularly in the island of Ceylon.

CALOTO, in Geography, a town and department belonging to the jurisdiction of Popayan in South America. The extent of this department is considerable; it is also rich, and abounds in the products of the earth; the soil being fertile, and the country every where interspersed with farms. But of all the parts in this jurisdiction, it is the most subject to tempests of thunder and lightning. This has brought into vogue "Caloto bells," which are used under a persuasion that they have a special virtue against lightning; and of which we have the following account. The town of Caloto, the territory which contains a great number of Indians, of a nation called "Paezas," was formerly very large; but these Indians, suddenly affailing it, forced their way into it, set fire to the houset, and massacred the inhabitants. Among the slain, was the priest of the parish, who was the particular object of their rage, because he exposed the folly and wickedness of their idolatry, and the turpitude of their vices; nor did the bell of the church escape their rancour, as by its found it reminded them of the hours for receiving religious instruction. After many fruitless endeavours to break it, they determined to bury it under ground, that they might not any more be reminded of their duty, and abridged of their liberty. On the news of their revolt, the Spaniards, in the neighbourhood of Caloto, took arms, and having avenged themselves of the insurgents in a battle, they rebuilt the town, and having taken up the bell, placed it in the Recole of the new church; since which event, the inhab- itants, to their great amonishment and joy, observed, that when a tempest appeared to be blowing in the air, the rolling of the bell dissipated it. The news of this imagined miracle induced many persons to solicit pieces of it to make clappers for little bells, in order to enjoy the benefit of its virtue, which, in a country peculiarly subject to tempests, was deemed highly advantageous. To this circumstance Caloto owes its reputation for bells. Adam's Voyage to South America by Juan and Ultrà, vol. i. p. 342.

CALOTTE, a cap, or coil of hair, fattin, or other fluff; used first for necessity, but now become an ecclesi- astical ornament in France.

It was first worn by cardinal Richelieu: the red calotte is a badge of a cardinal.

CALOTTE, in Architecture, a round cavity, or deprefure in form of a cup, or cap, lathed and plaistered, used to diminish the rise, or elevation of a chapel, cabinet, alcove, &c. which, without such an expedient, would be too high for other parts of the pile.

CALOUD, in Geography, a town of Hindooftan; in the fouth of Dowalatabad; four miles W. of Carballa, and 210 N.W. of Hydrabad.

CALOVIUS, ABRAHAM, in Biography, a Lutheran divine, was born in 1612, at Morungen, in the duchy of Brunswick, and became doctor in theology at Rollock, in 1637, and theological professor in that University. In 1643, he was made rector of the college at Dantzick; and in 1650, professor of theology at Wittenberg. He was the most rig- id divine of his party, and distinguished himself on a variety of occasions by his disputes with the reformed ministers, and particularly with Calixtus, of whom an account is given under the article CALIXTINS. Such was the part he took in this controversy, that those who enlisted under his banner were denominated "Calovians." He exercised the office of superintendent-general of the Lutheran churches, and continued his controversy warfare till his death in 1686. His works were numerous; they were chiefly polemical, and are now forgotten. Moreri. Molheim, E. H. vol. v.

CALP, in Mineralogy, a black quartz stone of Dublin, a species of basalt, found in large masses, of a bluish black, or dark-greyish blue colour, variously intersected with veins, of white calcareous spar, and often invested with the fame. In the direction of its flata it easily splits into large flags. Sp. gr. from 2.64 to 2.70. It effervesces with mineral acids; and at 150° melts into a black compact glass; contains 50 per cent. miscalx, the remainder being flixus, argil, and iron. This mineral seems to be the calcareous trap of La- fius, Hartz. 170. Kirwan's El. of Min. vol. i. p. 233.

CALPAS, in Ancient Geography, a river of Asia Minor in Bithynia, at a small distance W. of Sangarius. Strabo and Ptolomy.

CALPAS, CALPE, a sea-port of Asia Minor, in the Euxine sea, between Heraclea, and Byzantium in Bithynia.

CALPE, a mountain of Spain, in that part of Buctica which is now called Andalusia, opposite to that in Africa which bore the name of Ablya, and one of those which were called the "Columns of Heracles." At the foot of this mountain, towards the sea, stands Gibraltar. Calpe is flayed by Strabo a famous ancient Spanish sea-port; whereas, Pliny, Ptolomy, Mela, and others, only call it a mountain: whence the learned Bochart and Calafubon have thought, that the Calpe of Strabo was inflected, by the mixture of some transcriber, for Carteia. But it has been inferred by some learned persons, from an inscription on a medal, with these letters, C. I. CALPE, and "Colonia Julia Calpe," that Strabo's text is correct; and they further allege, that Ovidius overtook Caesar near the city of Calpia, which is the same with Calpe. We may therefore conclude, either that there were several cities situate at the mouth of the strait, on account of its advantageous situation, one of which was called Calpe, or Calpia; or else that the Carteia, which was situate near the promontory of Calpe, had Likewise taken that name from it.

CALPE, in Grecian Antiquity, a race performed by marcs,
which constituted one of the Olympic games. This race was instituted in the 71st Olympiad, and, together with the "Apenn," abolished in the 84th. In this race, the riders were accustomed, like the Anebatae, to leap from the backs of the mares towards the last slge or period of the course, and lying hold of the bridles, they finished the race in that manner. Well's Pindar, vol. iii. p. 143.

CALPENTEN, in Geography, an island in the Indian sea, near the west coast of the island of Ceylon, about 40 miles long and six broad. N. lat. 8°. E. long. 79° 50'.

—Also, a town of Ceylon, opposite to this island. N. lat. 8° 15'. E. long. 79° 50'. Perceval, in his "Account of the Island of Ceylon," (p. 107.) informs us, that a company or two of Malays is stationed here, and that when he left the island, it was commanded by a Dutch officer, who had entered into the English service, and who received this appointment from governor North. This, he adds, is one of the best places on the whole island for game; and between this and Putalam, at a small distance, the coast is remarkable for its salt-pans, which are formed by an arm of the sea which overflows part of the country between these two places. The Dutch manufactured, on this part of the island, a large quantity of salt, which they considered as very important to their interests, and the most formidable weapon which it was in their power to employ against the native king, who could not procure any salt but by their means. Since the English took possession of the island, this manufacture has been almost wholly neglected. It is capable, however, of being rendered very profitable, as it is the only one of the kind on this side of the island, and the most convenient situated for supplying the king of Candal's dominions.

CALPENY, one of the Laccadive islands, in the Indian Sen. N. lat. 10° 5'. E. long. 73° 29'.

CALPOLALPAN, a mountain in New Mexico, which abounds with quarries of jasper and marble of different colours.

CALPRENDE, Gautier de Costes, in Biography, a respectable writer of romances, was born in the diocese of Calors, and educated at Tolosane. In 1622, he entered into the regiment of guards at Paris, obtained a pension from the queen, and became gentleman in ordinary of the king's bed-chamber. The first pieces by which he made himself known as a writer, were composed for the theatre, and his "Mithrdates" appeared in 1635. He was, however, chiefly distinguished by his romances, in the composition of which he has the merit of invention. These were his "Caffandra," "Cloeopatra," and "Pharamond," each consisting of 10 or 12 large volumes in 8vo., which by their novelty, and the variety of adventures contained in them, attracted attention for some time, but gradually sunk by their prolixity into oblivion. He also wrote tragedies, of the best of which is his "Earl of Effex," from which Byron copied some scenes in his tragedy of the same title. His character was respectable, and he was employed in some foreign negotiations. His death was occasioned by an accident in August 1663. Nouv. Dict. Hist.

CALPURNIAN Lark, in Roman Antiquity, a law proposed by L. Calpurnius Piso, tribune of the people, in the beginning of the third Punic war, during the confiduph of L. Marcus Cæsarinus, and M. Manilius, A. U. 604; and widely designed to restrain the avarice and injustice of the Roman magistrates, by which the states, whom the givers of provinces had oppressed and plundered, were authorized to apply to the judges for restitution of what had been unjustly taken from them: hence called "De pecuniar repetundis." In consequence of this law, the tribune Calpurnius probably acquired the honourable surname of "Frigius," or honest man.

CALPURNIANA, in Ancient Geography, a town of Spain, placed by Ptolemy in Bithynia, in the territory of the Tunduli, and mentioned in the Itinerary of Antoninus.

CALPURNIUS, or CALPURNUS, Titus, in Biography, a Latin Sicilian poet, who lived about the latter part of the third century, under the emperors Carus, Carinus, and Numerianus. Seven of his elegues are extant: the first of which was composed on the accession of the emperor Carus, in which we may perceive, with pleasure and contempt, the effusions of congratulation and flattery. Two shepherds, avoiding the noon-tide heat, retire into the cave of Eaurus. On a spreading beach they discover some recent characters. The rural deity had defended, in prophetic verse, the felicity promised to the empire, under the reign of so great a prince. Eaurus hailed the approach of that hero, who, receiving on his shoulders the linking weight of the Roman world, shall extinguiish war and faction, and once again restore the innocence and security of the golden age. The design of this elegue is preferred by Fontenelle to that of Virgil's Pallas. But notwithstanding some agreeable description of rural objects, which marks these elegues, they manily the declining taste of the age by a want of purity in the style, and of nature in the sentiments. Editions of them have been given by Barthius, Hacor. 8vo. 1613; in the "Poete Ref Venet. Leyd. 1728, 4to.; and in the "Poete Latine minores," Leyd. 1751, 4to. Vol. Poet. Lat. Nouv. Dict. Hist. Gibbon's Hist. vol. ii. p. 93.

CALPY, in Geography, a town of Hindoostan, in the country of Agra, seated on the south bank of the Jumna river; 98 miles S. W. from Lucknow; 115 N. W. from Allahabad; 160 S. E. of Agra; 239 miles N. W. of Benares; 277 S. E. from Delhi. 821 N. E. of Bombay; 804 N. W. from Calcutta by Moorheadabad; 715 N. from Hydrabad. N. lat. 26° 15'. E. long. 80° 4'.

CALQUING, or Calking, a term in Painting, &c., used where the backside of any design is covered with black lead or red chalk; and the strokes or lines traced through on a waxed plate, wall, or other matter; by passing lightly over each stroke of the design with a point, which leaves an impression of the colour on the plate or wall. This method of off-tracing may likewise be performed by prickling the original print, or drawing, and transmuting coloured powder through the punctured holes, in order to mark the outlines of a new ground; or, by dissolving part of the printing ink by means of soap, and impressing it in that state on a fresh ground. See DESIGNING.

CALTAGE/RO, in Geography. See CALATAGIORON.

CALTARO, a town of Dalmatia, in the republic of Ragusa, 24 miles N. of Ragusa.

Gen. Ch. Cal. none. Corol. Petals five or more, egg-shaped, flat, spreading, deciduous. Stem. Filaments numerous, thread-shaped, shorter than the corolla; anthers crested, obtuse, compressed. Fil. germ superior, from four to fifteen or sixteen, crested, oblong, compressed; style none, frigmas simple. Peric. Capsules short, acuminate, spreading, opening at the upper or inner future. Seeds numerous, oblong, egg-shaped, smooth, affixed to the upper future in a double row.

CALTHA, in Flora, a genus of flowering plants. In the one, every flower is on a short peduncle, the lower and half of the lower, a little branched, leafy, and hanging. Leaves between heart and kidney-shaped, acutish, pubescent, villous, smooth, of a deep shining green. Leaves on long, hollow, semi-cylindrical peduncles, sometimes entire; the others alternate, and nearly sessile. Stipules brown, membranaceous, withering. Flowers in all their parts of a golden hue. Their flowers smaller, white, red at the edge. It is a natural habit with the preceding species, but is leaf in all its parts. Capsules triangular. Perennial. Found by Ghmich and Pallas in Siberia.

CALTHA alpina, Tab., A. 356. See Arctica montana. CALTHA, B. Zey. Tab. 22. fig. 1. See Verbesina calendulacea.

CALTHA officinalis, Scop. arvensis, C. Bauh. ; minima, J. Bauh. See Calendula arvensis.

CALTHA vulgaris, C. Bauh. See Calendula officinalis.

CALTHA maritima, Tour. inf. 499. See Calendula icaena.

CALTHA africana flore extus ferrugineo, Morif. hirt. 3. Tab. 8. See Calendula pluriflora.

CALTHA nomine majori oblongo, Breyn. Tab. 14. fig. 2. See Calendula hybridis.

CALTHA feminine pleno cordato, Boerhaav. Lugd. See Calendula nudicaulis.

CALTHA folis erici angustis, Boerhaav. Lugd. See Calendula graminifolia.

CALTHA, in Entomology, the species of Chermes that feeds on the flowers of the caltha palustris, whence its name. Linn. Fa. Suec.

Ob! The antennae are black at the tip; thorax rufous with three black curves; wings white with yellowish veins, and a brown dot.

CALTHELLA, a species of Phalena, in the Tinea family, the anterior wings of which are entirely golden; and the head ferruginous. Linn. Fa. Suec. Frequent in Europe, on the flowers of caltha palustris. Its size is small. This is the rubiformis of the Vienna catalogue.

CALTHIeriSSA, in Ancient Geography, a town of Asia, in Lesser Armenia, according to Ptolemy, marked in the Itinerary of Antonius on the route between Nicopolis and Satala.

CALTROP, or Calthrop, in Military Language, an instrument with four iron points, each three or four inches long, disposed triangularly; so that there are always three points bearing on the earth, the fourth being in the air. Several of these, fixed in the ground, or thrown into breaches where the cavalry is to pass, track into the horses' feet and embarrass them.

An instrument of this kind with three iron spikes is used in Siberia &c. in hunting the wolf.

CALTROPS, in Botany. See TRIBULUS.

CALTROPS, water. See Trapa.

CALTHA, in Geography, a fortres of the island of Ceylon, at the mouth of a river, which is one of the largest branches of the Nilwady, and is here about a mile broad. It washes two sides of the fort which commands it, and is navigable by boats to the sea. The eminence on which the fort stands overhangs the river, and commands an extensive and most picturesque prospect. This fort from its situation is capable of being rendered a very strong post. The commanding officer prefers in the court of justice, and determines all disputes among the peacocks. The sea, the elplanade, and the village on the outside of the fort, as well as the beautiful surrounding country, render Caltha a very delightful scene. Some tracts of cinnamon are scattered up and down in the vicinity of it; and a little way south of it is the termination of that fertile district of Colombo which contains so great a proportion of the wealth of Ceylon. About 10 miles from Caltha is a temple of "Buddha," built on a flat space, cut out of a small hill. It is a small square building, constructed of brick, with a sloping tiled roof, and a gallery surrounding it. In an apartment of this temple, the image of the deity, about 12 feet long, lay reclining on his side, with his right hand under his head: the place was illuminated with lamps, and flowers in abundance were spread around. The walls were daubed with streaks of red, black, and white paint; and on them were marked some Cingelese characters. Near the temple were a few huts for the priests. The country about Caltha abounds with game, and certain native manufactures are carried on to a considerable extent around it. A great quantity of arrack is made from the groves of cocoa trees, which extend several miles in every direction, forming from Colombo to Caltha, and several miles beyond it, one continued grove. Here is also a large plantation of sugar-canes, and a distillery of rum is carried on by some Dutchmen, who reside in the village and neighbourhood; but this rum is much inferior in quality to that of the West Indies. Six miles onward from Caltha lies "Barebaren," a small village, with a fort of harbour formed by a projection of land where the river runs into the sea. This is almost the only place where the high surf and rocky shore on this coast allow ship-boats of European construction to land. At Barebaren there is a considerable manufacture of cordage and cables from the cocoa-tree. Large quantities are sent from hence to Colombo and Point de Galle, to supply the vessels which trade to these ports. A few miles further lies "Bentot," only remarkable for producing the boat oysters on the island, and almost the only species used on the island as food. Caltha is distant about 28 miles from Colombo. N. lat. 6° 34'. E. long. 79° 50'. Percival's Ceylon. See COLUMBO and Point de Galle.

CALVADOSS, in Geography, a ridge of rocks, near the coast of France, 12 miles in length. N. lat. 49° 22'. W. long. 5° 51' to 0° 32'.

CALVADOS, one of the five departments so called from the long ridge of rocks above-mentioned, formed of Normandy and the north part of Perche. It is bounded on the north by the Channel; on the east by the department of Eure;
on the south by that of Orne, and part of the department of the Channel, which also bounds it on the west. It extends from the mouth of the Seine easterly, to the river Vire westerly, about 50 miles, and 50 miles from north to south: its superficies is about 1,117,643 square acres, or 570,427 hectares: its population consists of about 484,212 persons: and it is divided into six communal districts. Its capital is Caen.

CALVARIA, or Calva, the scalp, or upper part of the head; so called from its growing bald first. See Baldness. The external parts of the calva are the synicpum, occiput, vertex, and temples; all invested with the hair, and the common integments of the body.

The calvaria in adults consists of eight bones, one of the forehead, another of the occiput, two of the synicpum, two of the temples, and two others common also to the upper jaw, viz. the cuneiforme and spongiform.

CALVART, Denis, in Biography, a painter of history and landscape, was born at Antwerp in 1555. He began with painting landscapes; but as he wished to adorn them with human figures, he determined to seek improvement for this purpose in Italy. In his way to Rome he stopped at Bologna, where he became the disciple of Prof-nero Fontana. During his residence in this city, he applied with diligence to the study of his art, and copied the works of Correggio and Parmigianof. He then accompanied Lorenzio Sabattini to Rome; and perfected himself in design, perspective, architecture and anatomy. From Rome he returned to Bologna, where he opened an academy, which was much frequented, and which produced, besides a number of other excellent artists, Guido, Albano, and Domenichino. He lived with his pupils on terms of easy familiarity, and took great pains in improving them; though his character was degraded by passion and avarice. His own works were simple in their design, correctly drawn, well disposed, coloured in a grand style, and touched with freedom and elegance; but they are not altogether free from a Gothic air, which he brought from his own country. His principal performances are at Rome and Bologna; in the latter place there is a fine picture, representing two hermits, which is correctly designed, beautifully coloured, and delicately pencilled; and in the Pembroke collection at Wilton, there is a nativity painted by this master. Some of his works have been engraved. Calvart died at Bologna in 1619. D'Argenville. Tinkington.
